# Purpose and Approach

## Purpose and Approach

This volume is a compilation of the reports prepared for the Commission by both outside authors and the Commission itself. Most of these reports provided the Participants, the Commissioners, and the general public with research-based information on matters relevant to the Commission's mandate and were shared during the public proceedings. This volume also includes reports on public engagement and community-based initiatives undertaken by, or with the support of, the Commission. Several of the reports that appear in this volume were completed following the close of public proceedings.

Parts A and B of this volume are made up of expert and technical reports. Research-based expert reports that were commissioned met or exceeded the standards of Canadian law with respect to expert evidence, including in relation to the independence of the report writer and the reliability of the research methodologies used. These reports have not been edited or formatted to conform with the style of the Commission's Final Report.

Part C contains the environmental scan of prior recommendations and four separate summaries of international reports prepared by the Commission.

The environmental scan brings together recommendations from 65 previous reviews in Canada relating to the matters identified in the Commission's mandate. The scope of the scan included reports of commissions of inquiry; reports of government standing committees, law reform commissions, and government-commissioned evaluations and reviews; reports of the Civilian Review and Complaints Commission for the RCMP; and reports of coroner's inquests. The reviews are grouped thematically and, within each group, are listed in chronological order. The Commission also prepared a summary and analysis of the recommendations generated in response to the March 2019 terrorist attack on Christchurch Masjidain in New Zealand, the 2011 Oslo and Utøya mass casualty in Norway, three mass casualties in the United Kingdom (1987 Hungerford shooting, 1996 Dunblane shooting, and 2010 Cumbria shootings), and the 2016 Orlando Pulse Nightclub shooting in the United States.

In addition, the expert report by Jude McCulloch and JaneMaree Maher, in Part A, provides an extensive discussion of the reports prepared after the 2014 Sydney hostage crisis, also known as the Lindt Café siege, in Australia.

Part D contains reports on four initiatives designed or supported by the Commission to gather information and perspectives from members of a range of communities. The first of these reports is “Share Your Experience.” In early 2022, the Commission invited people from the communities where the mass casualty took place, from across Nova Scotia, and from the rest of Canada and beyond to contribute by sharing how the mass casualty affected or continued to affect them. We named this project “Share Your Experience.” The more than 900 responses received helped us to understand the broader effects of the mass casualty. “Share Your Experience: Summary of Responses” summarizes and analyzes these responses.

During its final phase of work, the Commission hosted a number of safety-related conversations in communities most affected by the mass casualty along with a series of consultations with representatives from stakeholder organizations. The community conversations recognized that individual community members are subject-matter experts on how to assure community safety. Through these facilitated conversations, we learned more about how the mass casualty affected feelings of safety, day-to-day, and heard perspectives on how to keep communities safer in the future. Stakeholder consultations acknowledged the role played by a wide range of governmental and non-governmental organizations in community safety and well-being. The Commission convened consultations with stakeholders on five topics: gender-based and intimate partner violence; early childhood education and youth education on community safety; support services in rural communities; safety in rural communities; and safety in Indigenous communities. Reports on these two initiatives are included in Part D.

Part D also includes a report prepared by the Halifax-based Avalon Sexual Assault Centre on its community engagement work with marginalized communities targeted by the perpetrator. Avalon is a community-based organization and was a Participant at the Commission (in coalition with Women’s Legal Education and Action Fund (LEAF) and Wellness Within). Avalon designed and implemented a process to create culturally responsive safe spaces in which members of these communities could share information with the Commission on a confidential basis. Its report presents the themes identified by survivors of violence, including experiences with the perpetrator, and recommendations.

These reports are also available on the Commission website:

Critical Incident Decision-Making

WORKS CITED	36
APPENDIX A: SAMPLE SCENARIO WITH COMMON DECISION ERRORS	45

## **I. Introduction**

This report addresses decision-making in the context of high-stakes critical incidents. We define critical incidents as events in which demands exceed resources, where there is high uncertainty, dynamic and fast-moving goals, and high stakes. Critical incident decision-making (CIDM) is highly complex because many critical incidents have no analogue, and thus there is no direct prior experience for decision-makers to draw upon.

### **1. Overview of Critical Incident Decision Making (CIDM)**

This section introduces two broad categories of decision-making theory and identifies their limitations in the context of critical incident decision-making (CIDM). The first category is traditional or normative decision-making. Traditional theories of decision-making (also called “normative”) have been under development for over three hundred years and have their roots in economics, philosophy, and mathematics (Doyle & Thomason, 1999). The traditional approach is analytical, in that it assumes decisions are made through a process of logical (i.e., unbiased) probabilistic analysis. This approach has been characterized by the following main concepts (Funder, 1987; Gigerenzer & Todd, 1999):

1. There is a choice between multiple available alternatives;
2. Decisions are the result of a deliberate analytical process that involves a comprehensive search for information that culminates in optimal performance; and
3. Models can be developed and tested quantitatively that will predict decision-making.

A second approach, outlined in more detail below, is naturalistic decision-making (NDM), which is driven by the idea that we choose “workable” solutions and do not always compare options in parallel. Whereas traditional theories of decision-making have assisted psychologists in understanding decision-making in closed or laboratory environments, NDM focuses on decision-making in the “real world” (Alison, Power, et al., 2015). As argued by Gary Klein,

So by 1989, it was fairly clear how people didn't make decisions. They didn't generate alternative options and compare them on the same set of evaluation dimensions. They did not generate probability and utility estimates for different courses of action and elaborate these into decision trees. Even when they did compare options, they rarely employed systematic evaluation techniques (Klein, 2008: 456).

## Critical Incident Decision-Making

Although there are many different NDM models (see Lipshitz, 1993 for an outline of numerous examples), recognition-primed decision-making (RPD) (Klein, 1993; Klein, 1998) is viewed as “prototypical” (Lipshitz, Klein, et al., 2001). Recognition-primed decision-making developed serendipitously to explain research on how fire commanders made decisions under time pressure and high uncertainty (see Klein, Calderwood, & Macgregor, 1989). RPD involves experts recognizing a type of problem quickly (certainly more quickly than novices), based on their experience of dealing with such events in the past.

Klein and colleagues figured that time constraints would cause commanders to refrain from identifying and analyzing all available courses of action and instead generate only a small number of options, comparing a favored option and an alternative before making a decision. The reality was even starker: the commanders often carried out the first course of action they identified. Rather than deliberating about the advantages and disadvantages of different options, they “relied on their abilities to recognize and appropriately classify a situation... Once the fireground commanders knew it was ‘that’ type of case, they usually also knew the typical way of reacting to it” (Klein, 1998: 49). Emanating from this idea that a decision-maker sizes up a situation and responds with the first course of action generated comes the key insight of the RPD model: the more “expertise” an individual has, the more feasible that first option will be (Klein, Orasanu, et al., 1993).

The problem with both traditional decision-making and recognition-primed decision-making models is that they struggle to explain decision-making when two conditions are present:

- (1) There is no clear “best” or “workable” course of action, and
- (2) The decision-maker is faced with a novel experience or problem and thus has no prior analogies to guide their decision-making.

Our own work has reinforced that in many cases, these two conditions are indeed present during critical incidents and decisions that involve high uncertainty (see Alison, Palasinski, et al., 2017; Shortland, Alison, & Moran, 2019). As such, we have often found it useful to frame the process of CIDM not as a process of selecting the “best” outcome but as a process of calculating the “least bad” outcome. Most options are high-risk, most will carry negative consequences, and many will be immutable and irreversible once committed to (Alison & Crego, 2008; Shortland & Alison, 2020; van den Heuvel, Alison & Crego, 2012). As this report will address, the main challenges faced by critical incident decision-makers often relate to failures to make decisions in time or at

all. Our work focuses on the processes that contribute to delayed decision-making and implementation.

Over the past several decades, our work has begun to identify common psychological factors that play a role in the ability of decision-makers to make decisions during critical incidents (Alison & Crego, 2008; Alison, van den Heuvel, et al., 2013; Alison, Power, et al., 2015; Alison, Palasinski, et al., 2017; Power & Alison, 2017; Shortland & Alison, 2020; Shortland, Alison, & Moran, 2019; van den Heuvel, Alison & Crego, 2012; van den Heuvel, Alison & Power, 2014). These range from individual factors (stress and strain) to organizational factors (communication complexity and barriers to effective teamwork). We have identified “decision inertia” (discussed further below) as a common outcome of these psychological and organizational factors. These factors, which will be outlined more fully below, include:

- **Stress:** Critical incidents place decision-makers under immense stress and strain. These include cognitive and physical stressors.
- **Communication Complexity:** Critical incidents often involve multiple agencies. The need to communicate across different agencies, across various locations, places unique pressures on decision-makers.
- **Inertia Traps:** Critical incidents create inertia traps in which individuals find themselves prone to failing to act, in time, or at all.

Take home points:

1. CIDM is highly complex because (a) many critical incidents have no “best” options, and (b) decision-makers often have no analogue for the event and thus no direct prior experience to draw upon (Alison & Crego, 2008; Alison, Doran, et al., 2013).
2. As a result, traditional and recognition-primed models of decision-making, which may be useful in other contexts, are less relevant to CIDM (Shortland, Alison & Moran, 2019 Shortland & Alison, 2020).
3. Instead of focusing only on how people make decisions, in CIDM it is equally important to look at how people do *not* make decisions in time or at all, and what derails their decision-making processes (i.e., they lose focus on a key goal or outcome and get distracted or diverted onto other less critically pressing aspects of the response) (Alison, Palasinski, et al., 2017; 2018; van den Heuvel, Alison & Crego, 2012).

## 2. Idealized Decision-Making Processes

Effective CIDM is based on several pillars. Our previous work has outlined several of these pillars and, critically, the differences between expert and novice decision-makers (Alison & Shortland, 2022; Shortland, Alison, & Moran 2019; van den Heuvel, Alison & Crego, 2012). The

## Critical Incident Decision-Making

observations below are based on both our empirical research and decades of observing, conducting, and evaluating CIDM training nationally and internationally with emergency services, military, and other populations who make high-stakes decisions. Based on our research and experience the pillars of CIDM are:

- **Situational Awareness:** Poor outcomes are often the result of decision-makers pinning a diagnosis on either a one-and-only plausible explanation or, at the other extreme, a proliferation of different models that becomes unwieldy. Novices either do too little or too much; elite decision-makers, by contrast, have enough but not too many ideas about what is going on (Hoffman, Ward et al., 2013).
- **Time Management:** Elite decision-makers ask themselves this crucial question: “Do I need to decide this now?” If the answer is yes, they commit to a course of action. If it’s no, they seek more information to further clarify what they are dealing with. Novice-decision makers fail to make effective use of time: either they act too slowly, or they act too quickly.
- **Interrogating Assumptions:** Expert decision-makers adapt their perception of a situation as new information emerges. They are what we call “fluid thinkers,” and they can move on quickly and test hypotheses. Novices tend not to examine questions or consider alternatives.
- **Revision and Resilience:** Elite decision-makers revise their course of action based on new perceptions of the situation, even when that revision might not be popular with others around them.

#### *A. Endogenous and Exogenous Uncertainty*

The difficulty of CIDM often stems from the high degree of uncertainty that exists in a critical incident. We consider two forms of uncertainty in our work: endogenous uncertainty and exogenous uncertainty (Alison, Power, et al., 2015). In the context of critical incident decision-making, endogenous uncertainty stems from uncertainty about the event itself (Klein, 1993). In other words, endogenous uncertainty stems from not knowing what is going on in a situation, and it limits the ability of decision-makers to know (1) what options are available and (2) what the consequences of those actions will be (see also Waring, Alison, et al., 2020). Sources of endogenous uncertainty during a critical incident may include time pressure; sparse, ambiguous, or contradictory information; or information that is novel or overwhelming (Oransanu & Connolly, 1993; see also Alison, Power, et al., 2015).

The second form of uncertainty, exogenous uncertainty, stems from the surrounding management and team process (van den Heuvel, Alison, & Power, 2014). It is uncertainty “about the operating system responding to the decision problem” (van den Heuvel, Alison, & Power,

2014: 4). Sources of endogenous uncertainty can be a lack of clarity about the roles and expectations of oneself and others (Alison, Power, et al., 2015).

### *B. Situational Awareness*

Situational awareness (SA) is “the perception of the elements in the environment within a volume of time and space, the comprehension of their meaning and the projection of their status in the near future” (Endsley, 1988). Put simply, situational awareness is a state in which individuals (1) understand the elements in their environment, (2) understand the relationship of those elements to each other, and (3) use this understanding to guide their behavior. Endogenous uncertainty thus directly impacts the ability of decision-makers to develop situational awareness.

Endsley (1995a) proposed one of the most cited models of situational awareness. The model seeks to “explain dynamic goal selection, attention to appropriate critical cues, expectancies regarding future states of the situation, and the tie between situation awareness and typical actions” (Endsley, 1995a: 34). Endsley proposed the following three steps to understanding a situation:

1. **Perceiving the Environment:** The first step in developing situational awareness is to perceive “the status, attributes, and dynamics of relevant elements in the environment.” (Endsley, 1995a: 36). This entails getting the best information possible on the relevant attributes of the environment. It requires the decision-maker to ask, “Which bits of the environment are useful/important?” In a critical incident, this may involve accurate data on the location, type, number, capabilities, and dynamics of any threats in a given area, or the number of casualties.
2. **Comprehending the Situation:** The second stage is to comprehend the situation. This requires synthesis of the elements collected at stage 1 in order to form a holistic picture of the environment. At this stage, in line with Gestalt principles, the decision-maker “goes beyond simply being aware of the elements that are present to include an understanding of the significance of those elements in light of pertinent operator goals.” (Endsley, 1995a: 37). This is the sense-making component of situational awareness. It requires the decision-maker to ask, “What do these clues mean for my assessment of what is going on?”
3. **Projecting:** The final stage of situational awareness is the “ability to project the future actions of the elements in the environment, at least in the very near term” (Endsley, 1993: 37). This entails being able to predict the outcomes of a choice given the known causes of current elements within the situation. Here, the decision-maker asks, “If X is happening, what will happen next? And/or if I choose to do ‘X’, what will happen next?”

High uncertainty makes decision-making incredibly difficult because decision-makers are unable to answer three core questions:

## Critical Incident Decision-Making

1. What is happening in this situation?
2. What can I do and what will happen if I do it?
3. What value /outcome is the most important to me?

The following “bomb” hypothetical illustrates how decision-making difficulty increases when additional elements of uncertainty are layered into a problem. In the example, the decision-maker is tasked with disabling a bomb by cutting either a red wire or a blue wire. In a straightforward task, this decision is easy: “cut the red wire and disable the bomb.” In a more uncertain task, this becomes more difficult: “Cutting the red wire, or the blue wire, may, or may not defuse the bomb.” Furthermore, this decision is significantly more difficult if the decision-maker is faced with uncertainty as to which goal is most important among several goals. For instance, difficulty is increased if the decision-maker must also decide which is more important: attempting to defuse the bomb (even if it goes off), trying to save nearby civilians, or accepting that the bomb may go off, or placing the decision-maker’s own forces at risk of being killed if they cut the wrong wire.

When looking at a decision from the perspectives above, we can understand the difficulty of a situation by counting the number of “difficulty buttons” present in the situation. Obviously, it is not as simple as the more “difficulty buttons,” the harder the decision – because in some cases, the presence of one single factor can be enough to decide difficulty. But in general, the more factors present, the more challenging the decision is likely to be. The following list identifies factors that tend to increase the difficulty of a given decision:

- Are the outcomes serious and/or immutable?
- Are there too few/too many options?
- Is there uncertainty, time pressure, and high emotions?
- Is it difficult to know what is going to happen next?
- Is it unclear what the “best” option is?
- Is it unclear how the decision-maker will feel about the outcomes of the decision?
- Are people giving opposing advice?
- Is it unclear what the task/options are?
- Is it uncertain what will happen if the decision-maker chooses option A/B?
- Does the decision-maker know what the most important value is?

## II. Detrimental Tendencies in Critical Incident Decision-Making

In our experience of documenting CIDM both in immersive simulated environments and post-event, there are two tendencies that frequently inhibit decision-makers from accurately assessing critical incidents and considering all possible options: (1) over-reliance on analogies and (2) an inability to imagine “grim stories.” We outline both challenges below.

### 1. Over-Reliance on Analogies

Psychologists agree that there are several different cognitive strategies that people use to make decisions. One of the most common forms of decision-making is to use experience to guide our perceptions and course of action. This simple decision rule can be roughly defined as “Did what I did last time work?” If the answer is “yes,” do it again. If the answer is “no,” do something else. Such a strategy is incredibly useful and indeed in many cases can help us quickly and effectively make the right decision. Psychologists have called this tendency “analogical decision-making” and it involves using analogies between past events and the present to help predict what will result from a given decision (Houghton, 1996).

Analogies are powerful decision-making tools. They can in some circumstances provide insight into an uncertain situation by allowing decision-makers to apply what they have learned from similar situations. The problem with an overly analogy-reliant approach in the context of a critical incident is that decision-makers often mistakenly perceive that they are facing a situation they have previously faced when in fact it is a novel situation. In this case, anchoring to “I’ll do what I did last time” is the wrong decision-making strategy and can deter a decision-maker from fully developing situational awareness based on the particulars of the problem at hand. For example, we have in training observed that if we repeat a rhythm of low-risk events for trainees and then suddenly “inject” a high-risk scenario (for example, missing persons), trainees, having “habituated” to low-risk missing persons, are more susceptible to not noticing the high-risk case.<sup>1</sup>

The uniqueness of real-world critical incidents means that training scenarios can rarely be applied in one training event and then the learning from this used as a basis for all subsequent decision-making. For example, in interviews conducted with soldiers regarding their decision-

---

<sup>1</sup> This observation is based on delivering countless training exercises to a broad range of law enforcement agencies in the United Kingdom.

## Critical Incident Decision-Making

making in Afghanistan, they often highlighted how the realities and uncertainty of the real world made it difficult to apply their training because the situations they faced were *different enough* from training scenarios to cause doubt (Shortland, Alison, & Moran, 2019). As one of our interviewees recalled:

They train you that, you know, for example, you're doing convoy ops and you get hit with an Improvised Explosive Device (IED). They will literally take a 155-artillery round and they will toss it in the middle of the road with wires hanging out of it, and it is never like that. Never like that. You're never going to see it, you know, um, I would say that they train you that everything is a threat, but realistically, I remember my first couple of times going out, "there's black flags everywhere, what are those," you know, "are they signaling something?" Pigeons, a lot of people had homing pigeons, you know pigeons getting up. Oh, are they signaling the convoy or whatever? And sometimes I think it was, but a lot of times I think it is just pigeons flying around – or they are just flags! So, you know, they train you that the threat ... You know, every single time we train, you always get hit, or someone gets killed, or someone gets shot, you got to react in a different way. So, you know, training perceives it as more often there than it is. I think obviously the threat is there, and you really got to kind of learn it.

## 2. Avoidance of Grim Storytelling

Individuals often fail to imagine what could explain the behaviour they are witnessing. Whether it is intelligence analysts looking at al-Qaeda communications about targeting America or everyday individuals trying to understand why a loved one is suddenly aloof, too often the first instinct is to fall back on the first probable explanation that comes to mind instead of engaging with multiple possible causes. To overcome this tendency, we encourage police officers and those training for critical incident decision-making to imagine the worst-case scenario. We call this cognitively demanding act "grim storytelling." Storytelling is an underutilized method of learning, despite its universality and primality throughout history (Gottschall 2012). The purpose of generating worst-case scenarios in CIDM training is to help practitioners learn how to respond. When cautiously and critically facilitated, learning through grim storytelling helps plan for, adapt to, and recover from traumatic events. It is a powerful learning tool that helps individuals to prepare for scenarios they may be unable to imagine otherwise.

It is important to recognize that imagining the worst-case scenario, does not mean that it is the only plausible scenario. At the other end of the spectrum, an event or behaviour may be completely benign or at least less bad than anticipated. So long as officers recognize that the worst-case scenario is just that – a possibility and not a probability – they can plan accordingly without catastrophizing. Considering worst-case scenarios gives officers a decision-making spectrum and

allows them to consider the options within the widest framework. This is especially important given the tendency to over-rely on seemingly analogous prior experiences, as discussed above. Grim storytelling can prepare decision-makers for the worst, such that if it happens, they can be more fully prepared and more accurately anticipate their next required moves.

In Alison, Shortland, et al. (2022), we have described the remarks of a Senior Police Officer regarding the emergency response to the Lashkar-e-Taiba terrorist attacks in Mumbai in 2008 and what he saw as the many failings of the police response. In addressing what he viewed as “the failings” (his term), he described a failure of imagination. He said, “None of us imagined this could ever happen – so we never trained for it. What we need are foretellers of doom that can imagine such things so that we may learn from them before they happen.” A failure of imagination has also been linked to critical incident preparedness in relation to the 9/11 attacks:

The issue of failing to imagine has previously been associated with a lack of preparedness. Similar accounts were given in the US 9/11 Commission report, which specifically highlights the “failure of imagination” (9/11 Commission, 2004: 336). Recommendations included the intriguing proposition that it is “crucial to find a way of routinizing, even bureaucratizing, the exercise of imagination” (9/11 Commission, 2004: 344). It is interesting to note, however, that despite the significant increase in scholarly research on terrorism after 9/11 (including preparedness and prevention of terrorism, and terrorist adaption (Shuurman, 2018; Wirtz & Rohrbeck, 2017), there has been little research on the role of imagination in predicting, preparing, and responding to acts of terrorism. This is, again, even though imagination in intelligence work has been advocated since the late 1970s (see, for example, Shackle, 1979: 88). Relatedly, even a “post-mortem” analysis of “grim” past threats, like Anthrax (or the September 11 attacks) can yield invaluable insights into other alternative scenarios (Bartlett, 1999) (Alison, Shortland, et al., 2022: np).

In our own research, we have consistently seen that (1) when uncertainty is high during critical incidents, many individuals are unable to engage in the imaginative process of grim storytelling, and furthermore, (2) those who *can* engage in this type of grim storytelling are often able to perform well under such conditions. For example, as part of a recent project on decision-making during medical triage, we interviewed Dr. Kevin Menes, the attending Emergency Room Physician in charge of the Emergency Department the night of the 2017 Las Vegas music festival shooting. When reflecting on how he prepared for his own decision-making (which has been

viewed as central to saving hundreds of lives that night), he has highlighted the importance of thinking ahead and planning for the worst-case scenario.<sup>2</sup>

### 3. Implications for Training and Preparation

In an ideal world, decision-makers would either have rules or protocols for every eventuality and/or always be able to draw upon enough previous similar experiences to be considered “experts” (Matthews, 2013). However, critical incidents are rare and often unique. It is therefore difficult if not impossible to perfectly match any protocol to a singular critical incident, and moreover, there is very little chance any decision-maker involved in the incident will have enough prior similar incidents to draw upon. Decision-makers tend to rely on seemingly analogous previous experiences. Instead, they must learn and practice innovative, creative, and adaptive strategies such as grim storytelling, which can improve their ability to respond to critical incidents (Hoffman, Ward, et al., 2013).

In our view, there has always been insufficient investment in these forms of thinking and training programs. Simple exercises that are repeated frequently can be very helpful. For example, we used a program called “7 at 7” with Merseyside Police in Liverpool, United Kingdom. Three times per week and after a shift, officers would spend seven minutes discussing a difficult case they dealt with that day, seven minutes describing what would have turned it into a critical incident, and then seven minutes discussing what they had now learnt. This 21 minutes, three times per week, was viewed (via survey and focus groups) as a valuable, low-cost way of enabling them to learn and think creatively.<sup>3</sup>

---

<sup>2</sup> This very recent interview with Dr. Menes and his team is part of early-stage data-gathering for a forthcoming publication. Some elements of the interview are reflected in a piece co-authored by Menes in which he highlighted the need to “mentally rehearse difficult scenarios ahead of time.” See Menes, Tintinalli, & Plaster, 2017.

<sup>3</sup> The details of this program are in Humann, 2018, an unpublished internal document held by Merseyside Police. See also Barnett & Ceci (2002).

### III. Impact of Acute and Chronic Stressors on CIDM

#### 1. “Fight or Flight” Response

Many of us will have heard of the “fight-or-flight response.” It is defined as the “immediate physiological reaction that occurs when danger or a threat to survival is perceived by an organism” (Milosevic, 2015: 179). Conditions of stress, fear, and uncertainty (those often present in CIDM) often trigger the fight-or-flight response, but the physiological effects of fight-or-flight route blood away from the brain, and that makes it harder to reach a decision (Derakhshan, Mikaeili, et al., 2019). The brain is an organ, and to work, it needs blood; the more work it needs to do, the more blood is required (Ogoh, 2017). That is why psychological researchers often assess neural activity by measuring the flow of blood to brain cells (e.g., through MRI brain scans) (Wang, Rao, et al., 2005). Brain activity is critical in CIDM because it requires cognitively demanding processes (e.g., grim storytelling, described above). The less blood there is available for the brain, the lower its capacity for completing cognitively demanding tasks.

Even stress that is insufficient to cause a fight-or-flight response can negatively affect performance. Acute strain, such as high levels of stress or physical exertion, can still cause “butterflies in the stomach,” blood rushing to your muscles, and feeling “weak in the knees.” Moments of acute strain can lead to the “emotional” brain dominating their decision-making. In such instances, officers can find themselves making catastrophic decisions with long-lasting consequences. In these moments, an officer ideally needs to let their body calm down and come back to the problem when their mind can fully engage with all the dimensions of what is going on (Hoffman, 2012).

It is important to create time where possible. As discussed further below, less effective decision-makers often act either too quickly and jump to conclusions without metaphorically and literally taking a breath, while others take too long and miss the opportunity for effective intervention. Where time is available and a period of short reflection can allow a more accurate view of the incident, it most definitely should be taken. Such cases may involve pausing for minutes rather than hours. While it can take the body over thirty minutes to return to baseline after stress (Shilton, Laycock, & Crewther, 2017), our own research has shown that even three minutes of effective breathing is sufficient to change how someone acts (Shortland, McGarry, et al., 2021). This recent study involved asking participants to make complicated least-worst decisions, but

## Critical Incident Decision-Making

before they made the decisions, half of the individuals were given a three-minute mindfulness breathing exercise that allowed them to calm themselves and focus on controlling their emotions. The other half listened to an audiobook excerpt. Those who were asked to breathe and think about how they felt were found to be more approach-orientated during the decision-making process: they wanted to make a positive impact on the situation rather than being cautious and worrying about doing the wrong thing. They were also faster to assess the situation and choose their courses of action (Shortland, McGarry, et al., 2021). Thus, even a few minutes can allow the body to return to a more optimal state and allow for officers to think more calmly through what will happen next, which may save hours of pain later.

## 2. Sleep Deprivation

The fight-or-flight response is one example of when blood temporarily diverts from the brain, but there are other causes of a temporary lower capacity for the brain to handle the cognitive demands of CIDM, most notably sleep deprivation. Critical incident decision-making can often involve long shifts of physical activity with little sleep, sometimes over multiple days. Sleep deprivation has been found to strongly impair human functioning. Research shows that people who operate for long periods of time without sleep are slower to react, make more errors, have trouble recalling stored information, and are less able to maintain attention (Harrison & Horne 2000). Tired people also show decreased neural activity and mental flexibility, as well as difficulties generating new ideas or solutions (Engle-Friedman, 2014). Other research using MRI scans has found that individuals who have been sleep-deprived for 24 hours have reduced blood oxygenation in areas of the frontal and parietal lobes of the brain – areas that we know are critical for action-planning and decision-making (Anderson & Cui, 2009). The frontal lobe of the brain integrates motivation, emotion, somatosensory information, and external sensory information to create unified, goal-directed action (Duncan, Emslie, et al., 1996). It is at the top of the hierarchy of neural structures devoted to the ways we respond to events and decide what to do and is therefore crucial to decision-making. If the processes of the frontal lobe are compromised in some way, the brain cannot make decisions as effectively, and critical incident decision-makers who are called upon to make hard decisions, as described in sections I and II above, are especially adversely affected.

In one study, a group of sleep-deprived soldiers were instructed to fire live ammunition at stationary cardboard targets. This was done on the sixth day of a week-long training activity, and

the students had “been kept busy since day one and were exhausted” (Larsen, 2001: 91). Unbeknownst to the participants, the researchers had swapped out the live ammunition for blanks and swapped the stationary cutouts for real people. When the cadets were given the order to fire what they thought were real lethal bullets, the targets that were meant to be cardboard cut-outs started moving. Sixty per cent of the subjects continued to shoot at the targets, despite the movement of the targets giving away their live status; and of the 40 per cent who noticed the targets were real people and decided not to shoot, only one individual warned the others. The researchers hence concluded that “reduced cognitive ability due to severe stress and sleep deprivation may play an important part in decision-making,” at the same time acknowledging that because of subjects’ awareness of their own sleep deprivation, it was “also possible that some of the students chose to disregard their doubts as to whether or not to fire, believing they were hallucinating” (Larsen, 2001: 96).

### **3. Summary**

We have already noted the challenges to CIDM that stem from the environment of critical incidents. However, as we have outlined above, the environment of CIDM can often pose additional challenges because of the presence of several acute and chronic strains, which make it harder for individuals to make decisions. Stress, with its attendant reduction in complex cognitive processing and narrowing of focus, exacerbates the errors seen in poor decision-making. Both acute, “in-the-moment” stressors (of the incident itself) and more chronic stressors (e.g., poor sleep leading up to and throughout a critical incident) can impact a decision-maker’s ability to effectively manage the incident.

### **IV. Failures to Act in Critical Incidents**

Many people assume that the biggest “mistake” to make when deciding is to choose the “wrong” thing. But our experience and research has led us to a different conclusion: the biggest mistake is often doing nothing – and this mistake is common in critical incident decision-making (see Alison & Crego, 2008; Alison, Palasinski, et al., 2017). In order to fully understand the phenomena of inaction in critical incidents, which we refer to as “decision inertia,” it is important to understand (1) the phases of CIDM that a decision-maker (ideally) needs to work through and (2) the different

## Critical Incident Decision-Making

ways in which an individual can fall off the tracks and either (a) fail to make a decision or (b) make a decision but fail to take the required actions to implement that decision.

### 1. SAFE-T Model of CIDM

To conceptualize the correct phases of CIDM, we use the SAFE-T model of decision-making. The SAFE-T model conforms to the many phase-based models related to how experts make decisions (see Hoffman's extensive work summarized in Hoffman, Ward, et al., 2013). The SAFE-T model was developed by van den Heuvel, Alison, & Crego (2012) based on extensive evaluation of the strategic decision-making literature and field work involving detailed naturalistic observation of decision-making in critical incidents (see Alison, van den Heuvel, et al., 2013).

The SAFE-T model identifies four key phases in accurate decision-making: situational assessment (SA); plan formulation (F); plan execution (E); and team learning (T[L]). Consider, for example, that you are walking along a quiet street, and you see an altercation between two people. First, it is important that you understand what is going on (SA): are they fighting, and if so, is it a fight or a mugging? Who is the aggressor? Once you have a good (or the best possible) SA, you need to work out what you can do (F), which in this case might include intervening, calling for assistance, phoning the police, or doing nothing. You then need to choose a plan and, crucially, do it (E). Once you have acted upon the decision, and the event has unfolded, you should then reflect on what happened, what you chose to do, and if your choice led to a good outcome (T). These stages reflect the general phase-based process that most individuals go through when making decisions, critical or otherwise (see, e.g., Lipshitz & Bar-Ilan, 1996). Although SAFE-T may well be an appropriate strategy (and is actually the one used by most decision-makers most of the time), applying it is in and of itself insufficient as a means by which to respond to critical incidents. Indeed, many issues may prevent this idealized process from occurring, and commonly, what then occurs is decision inertia.

### 2. Decision Inertia

Understanding the many ways in which CIDM can become de-railed is one of the largest benefits of taking our research "outside of the laboratory". By conducting research in the field, we can observe in real time the ways that actions fail to occur, even when it seems clear that an action is

## Critical Incident Decision-Making

required (see Alison, Power, et al., 2015; Alison, Palasinski, et al., 2017; Shortland, Alison, & Moran, 2019; van den Heuvel, Alison & Crego, 2012; Waring, Alison et al., 2020). As noted, we refer to this tendency as “decision inertia” – the inability to commit to a course of action in time, or at all—and it manifests in a slowing down of the decision-making process. In 2012, we introduced the first empirical study exploring the multiple paths to inaction during critical incidents (van den Heuvel, Crego & Alison, 2012). We used an immersive simulation system called HYDRA in which police officers navigated a complex evolving situation (an attack on an aircraft landing at Heathrow with terrorists aiming to crash it). Participants received real-time intelligence, could ask for more information, and could even speak with officers in other units. We observed the processes of decision-making as these police officers navigated extreme uncertainty in a simulated environment. Findings were based on live and recorded observations by the researchers, post-event debriefs, and participants’ own decision “logs.”

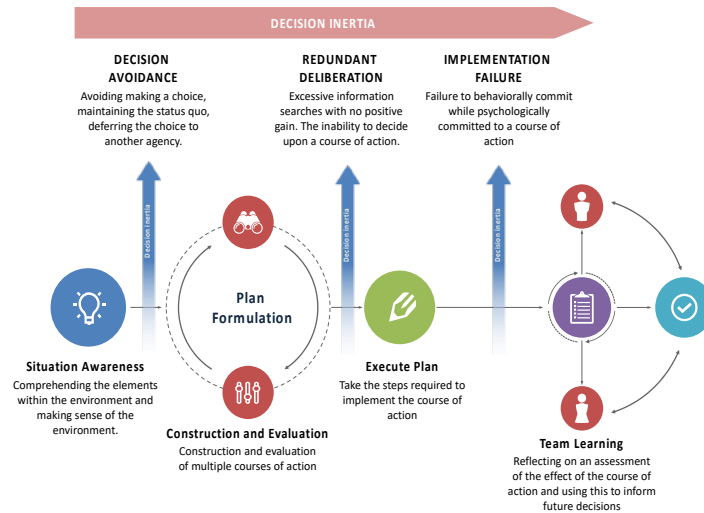

van den Heuvel, Alison and Crego (2012) found that high levels of uncertainty derailed officers’ ability to stick to the decision-making process, resulting in either non-action (omitting the decision altogether) or apparent actions (actions that deferred the choices until later moments or passed them on to other agencies). Despite awareness of the immense costs of delaying action and the goal of saving as many hypothetical civilian lives as possible, the subjects exhibited behaviours that can be defined as “derailments” from the “save-life” approach. According to the subject matter experts who reviewed their behaviours,<sup>4</sup> the teams did not make or implement critical decisions in a timely manner, with potentially detrimental consequences for non-simulated, real-world situations.

Based on the results of this study and others (Alison, Power, et al., 2015; Power & Alison, 2017; van den Heuvel, Alison & Power, 2014, we have identified three major ways in which people fail to act: decision avoidance, redundant deliberation, and implementation failure. These three points of decision inertia are highlighted below in **Figure 1** using the SAFE-T framework of CIDM:

---

<sup>4</sup> The subject matter experts in this case were two senior police officers.

## Critical Incident Decision-Making

Figure 1: Three Different Points of Decision Inertia within the CIDM Process<sup>5</sup>

#### A. Decision Avoidance

Decision avoidance, first outlined by Anderson (2003), is the psychological process of ignoring the need to decide. With reference to SAFE-T, the decision-maker does not enter the “SA” phase and avoids engaging in the process of thinking about the decision. For example, in a study involving a simulated terrorist attack at a large parade, seven of nine teams did not make the decision to cancel the parade (van den Heuvel, Alison & Crego, 2012). Five of these teams failed to cancel the event due to an inability to implement the decision (see implementation failure below), but two teams failed to even address the need to make any decision regarding the potential cancellation of the parade:

Seven teams did not make this decision; avoidance in this case was manifest as a complete omission by two teams (who did not address the subject), and a lack of implementation by the resulting five (these teams thoroughly discussed the decision problem of whether or not to

<sup>5</sup> This figure is a simplified re-creation of the figure originally outlined in: van den Heuvel, C., Alison, L., & Crego, J. (2012). How uncertainty and accountability can derail strategic ‘save life’ decisions in counter-terrorism simulations: A descriptive model of choice deferral and omission bias. *Journal of Behavioral Decision Making*, 25(2), 165–87. Doi: 10.1002/bdm.723.

cancel the military march but failed to reach a conclusion and implement a choice (van den Heuvel, Alison & Crego, 2012: 180).

Elsewhere in the same study, avoidance stemmed from a lack of clear policy and a tendency to defer the decision to another agency. From the above study, we can see that decision avoidance is a unique form of decision inertia that arises in critical incidents and involves a decision-maker refusing to engage in the decision-making process about a critical decision.

### *B. Redundant Deliberation*

The second form of decision inertia is redundant deliberation. Redundant deliberation is a cognitively demanding form of inertia in which a decision-maker fails to gain any additional advantage by thinking about a problem (Alison & Shortland, 2022. Alison, Power et al., (2015) has described redundant deliberation as pathological hesitation due to overthinking a choice between difficult options. It occurs when there is no standard operating procedure (to provide guidance) and can be exacerbated by the fact that decision-makers are not exposed to critical incidents often enough to build up a repository of expert knowledge (Shortland & Alison, 2020). Unlike decision avoidance, redundant deliberation occurs at the “F” phase (plan formulation) when a decision-maker cannot decide which is the best course of action to take. What is important about redundant deliberation is that it is cognitively active and involves the decision-maker being unable to choose between the options available to them. The number and variety of options cause significant cognitive conflict for the decision-maker, who must justify why one option is better and sacrifice the possible good outcomes of the options not taken (Shortland & Alison, 2020).

### *C. Implementation Failure*

The final form of decision inertia exists at the barrier between decision-making and behaviour. That is, in implementation failure the individual has made a decision (i.e., they have chosen a course of action), but they do not take the behavioral steps required to implement that action in the real world (van den Heuvel, Alison & Crego, 2012). This is failure at the final yet crucial stage of CIDM is an understudied phenomenon, but across the countless exercises we have run with various police services, it is not uncommon.

## Critical Incident Decision-Making

*D. Summary*

We have repeatedly observed in our work that the most serious breakdowns of critical incident decision-making are not errors of judgement or “incorrect” decisions but rather failures to make critical decisions in time or at all, or to implement chosen courses of action (Alison, Power, et al., 2015; Shortland, Alison, & Moran, 2019; van den Heuvel, Alison, & Crego, 2012; Alison & Shortland, 2022). There are three major ways in which decision-makers suffer from decision inertia during critical incidents. They can avoid thinking about the problem at all (decision avoidance), over-think the problem (redundant deliberation), and/or choose a course of action but not act on it (implementation failure). All three forms of decision inertia must be overcome to complete the decision-making process and manage a critical incident.

**3. Factors that Influence Decision Inertia in Critical Incident Decision-Making**

Previous research has identified a range of factors that can be present during CIDM and increase the likelihood that decision inertia will occur. We outline these factors below.

*A. Accountability*

Accountability involves being aware of appraisal by external audiences who have the power to instigate rewards or punishments (Baucus & Beck-Dudley, 2005; Klehe, Anderson, & Hoefnagels, 2007) and the requirement to provide a justification to these audiences (de Kwaadsteniet, van Dijk, et al., 2007). Decision-makers’ actions may be constrained when they know that they will be identified, judged, and punished (or rewarded). In this way, accountability is the psychological antithesis of anonymization (the process of being unidentifiable) and, logically, has the reverse effect. As comments made in anonymous online forums demonstrate, the condition of anonymity tends to make individuals less inhibited (Krysowski & Tremewan, 2021). Accountability, on the other hand, constrains behaviour.

Accountability can lead to both adaptive and maladaptive behaviours. The findings are mixed as to whether accountability improves or degrades decision-making (Hall, Bowen, et al., 2007). Experimental research provides evidence that the subjective experience of accountability affects decision-making. For example, Waring, Alison, et al. (2013) found that in a simulated hostage negotiation crisis, accountability increased the motivation for self-preservation and detracted from the decision-makers’ attention to the task at hand. This inhibited the decision-

makers' ability to discriminate between critically relevant and irrelevant information (Waring, Alison, et al., 2013).

Within the SAFE-T model, anticipation of accountability plays a role in information-gathering and in the interpretation processes of the SA phase. Accountability can also encourage a decision-maker to consider more information without first discerning its relevance, increasing cognitive load for little gain as they sift through data that may not aid in the decision (Tetlock & Boettger, 1989). In the "F" and "E" phases of decision-making, accountability encourages a decision-maker to switch towards egocentric, defensive justifications (Gollwitzer & Moskowitz, 1996). For example, police officers facing a simulated dynamic terrorist event shifted priorities away from saving the lives of those in a (potential) attack location to saving themselves – i.e., making decisions that could be defended if later reviewed (van den Heuvel, Alison, & Crego, 2012).

Like anticipatory regret, which is defined as anticipating feeling regret at some future time (Anderson, 2003), accountability is also linked to inaction. Alison, Eyre and Humann (2010) found that police officers viewed "non-decisions" (doing nothing) as less blameworthy than taking an action that may result in a negative outcome. This is consistent with "omission bias" (Spranca, Minsk, & Baron, 1991) whereby a harmful commission (i.e., doing something that causes a harmful outcome) is viewed as worse than the corresponding omission (i.e., doing nothing and the same outcome occurring). In fact, in a study in which subjects rated the relative harm of a range of behaviours, they viewed omissions as less immoral or less bad as decisions in comparison to harmful commissions. Furthermore, "a few subjects were even willing to accept greater harm in order to avoid action" (Spranca, Minsk, & Baron, 1991: 1).

It is clear, however, that a system of no accountability is not a suitable alternative in the context of critical incident decision-making. In such cases, careless decision-making and lack of consideration of negative consequences are clearly undesirable. It is therefore important to understand what types of decisions are most at risk of being avoided when an individual feels especially accountable and what types of decisions are most at risk of being taken when someone has no expectation of accountability. It is also necessary to ensure that while accountability is always considered, it does not detract from other CIDM priorities such as saving lives. As such, accountability is a critical part of any organization, but it should not tilt over into creating a blame

## Critical Incident Decision-Making

culture in which staff feel paralyzed by a pervasive sense that any action they take might be punished.

### *B. Uncertainty*

Uncertainty is a “sense of doubt that blocks action” (Lipshitz & Strauss 1997, 150). There is a correlation between uncertainty and the likelihood, intensity, and even duration of decision inertia. Endogenous uncertainty and exogenous uncertainty were described above in section I. In this section, we explain the impact of these forms of uncertainty on decision inertia.

#### *(i) Endogenous Uncertainty and Decision Inertia*

Endogenous uncertainty prevents a decision-maker from working out “what is going on” and therefore prevents the decision-maker from working through the stages of situational awareness, which was outlined above. When faced with endogenous uncertainty, decision-makers are more likely to avoid the decision (“I just don’t know enough to decide”) or fall into patterns of redundant deliberation by seeking to overcome uncertainty by gathering more information that, in some cases, does not exist. This leads to a cycle of attempting to obtain information that is unavailable, at the cost of acting.

#### *(ii) Exogenous Uncertainty and Decision Inertia*

As noted in section I, exogenous uncertainty can stem from not understanding the roles of those we are working with and what tasks they will or will not do. Trust in these partners (see below) plays a critical role in decreasing exogenous uncertainty. Interestingly, research on police decision-making in a hostage negotiation scenario found that exogenous uncertainty was more common than endogenous uncertainty, and exogenous uncertainty affected the planning and execution phases of decision-making (Alison, Power, et al., 2015). Specifically, in a study of a live hostage negotiation exercise, we measured uncertainty using observational methods (during the exercise and by reference to video footage), decision logs, and post-incident simulated recall interviews with trainee police officers. Transcripts were coded and analyzed thematically to get a sense of *why* people felt uncertainty during the incident. We then dichotomized the uncertainty as deriving from either endogenous source (about the problem situation itself) or exogenous sources (about the operating system that is dealing with the incident). Overall, exogenous uncertainty (75%) was more prevalent than endogenous uncertainty (25%) during plan formulation and plan execution

(Alison, Power, et al., 2015). Exogenous uncertainty was also associated with poor role understanding and trust. Endogenous uncertainty was more prevalent during discussions on situation assessment.

This taxonomy of uncertainty provides a useful way to categorize uncertainty during CIDM. What is especially useful is how it can inform efforts to minimize the negative effects of uncertainty. For example, dealing with endogenous uncertainties would entail targeting decision-making specific to the problem incident (e.g., introduce training or policy to reduce redundant fixation on rote-repetitive superordinate goals and focus on more short-term actionable goals during situation assessments). Dealing with exogenous uncertainties would entail improving decision-making relating to management and team processes across critical incidents (e.g., training to clarify distributed roles in critical incident teams to aid plan formulation and execution) (Alison, Power, et al., 2015).

### *C. Trust*

Linked to the issue of exogenous uncertainty, poor trust within a responding team is associated with decision inertia. High levels of trust can prevent decision inertia because trust allows teams to better approach a challenging situation without decision-making becoming derailed by conflict. Research on organizational decision-making has found that teams who trust each other are better able to handle the natural conflict (e.g., differences of opinion, interpersonal discord) that arises in a group when trying to solve a difficult problem (Simons & Peterson, 1999; Shortland, Alison, & Moran, 2019). Power and Alison (2017) found that a culture of mistrust can increase redundant deliberation because individuals must consider whether they can rely on the information they have received from others. This process adds cognitive burden to the decision-maker and further stress, the negative effects of which were outlined above. Low inter-team trust increases the likelihood that challenging situations that have task conflict result in relationship conflict and a breakdown of performance (Waring, Alison et al., 2022). Relationship conflict stems from interpersonal incompatibilities between members of a team and is generally characterized as emotional because it stems from personal issues (such as dislike) among group members and feelings such as annoyance, frustration, and irritation (Jehn & Mannix, 2001). Task conflict stems from differences among opinions about how the task should be completed (Amason & Sapienza, 1997; Jehn, 1997; Jehn & Mannix, 2001). When teams have low trust, there is a greater chance that task conflict

## Critical Incident Decision-Making

becomes relationship conflict, de-railing the ability of the team to work through the problem at hand (Simons & Peterson, 2000).

#### *D. Outcome Mutability*

Mutability is the capacity to reverse the outcome of a decision or event (Morris & Moore, 2000). Mutability is linked to the “lost opportunity” hypothesis (see Beike, Markman, & Karadogan, 2009), whereby decision-makers avoid launching interventions that offer a low chance of being “fixed” if the outcome is bad (like choosing to fire a weapon), because doing so will preclude opportunities that would have been available to them if they had taken an alternative action (or no action). In highly mutable events, decision-makers are often more accountable because they are viewed as having been able to prevent them (Coombs & Holladay, 2011). In other words, if an event – even as it is unfolding – can be changed, influenced or reversed, one might look less favorably on responders who failed to make that change compared to an event in which events were impossible to change or at least impossible to reverse. Highly immutable situations encourage indecision because of anticipatory regret regarding potential opportunities that could be lost due to irreversible decisions. In this sense, immutability amplifies fears of regret and accountability because an action taken cannot be undone. Unfortunately, given the nature of critical incidents, several decisions that decision makers face will be immutable.

#### *E. Interoperability*

Interoperability is the capacity of an organization to exchange information and use it to inform decision-making (National Police Improvement Agency (NPIA), 2009: 12). Previous research on the topic (NPIA, 2009) has found that the following factors increase interoperability:

- a common operational picture (i.e., all agreeing on what is going on)
- a hierarchical multi-agency organizational structure
- task interdependence
- collective accountability
- trust<sup>6</sup>

---

<sup>6</sup> See also the website of the UK Joint Emergency Services Interoperability Project (JESIP): <https://jesip.org.uk/>.

*F. Timebound Goals*

Some decisions have a set time limit or deadline, while others do not. Decisions that are not time-bound are more amenable to deliberation (Alison, Power, et al., 2015). The impact of time on decision-making is affected by the experience of decision-makers and individual personality factors (Alison, Power, et al., 2015). Experienced or skilled decision-makers can complete “must-do” tasks and appropriately pass over “nice-to-do” (but not critical) tasks. They are more able to adapt to time pressure using efficient and intuitive pattern-matching than decision-makers with less expertise (Alison, Doran et al., 2013). Furthermore, in a study conducted with police officers making investigative decisions, we found that those who had high time-urgency (the personality trait that governs the feeling that time passes quickly) experienced more problems making decisions when placed under an external time pressure (Alison, Doran, et al., 2013). This is because those who have high time urgency often spent some portion of their cognitive load worrying about the time limit, to the detriment of the decision-making process. In this sense, the effect of time on decision inertia can be a double-edged sword: an explicit time limit can encourage individuals to make decisions faster, but for some individuals, this will increase cognitive burden, potentially delaying decision-making. It is worth highlighting, however, that while time urgency is an individual trait and people vary on it, no research has explored how training can help mitigate its negative effects.

*G. Difficult Trade-offs*

Choice breeds trade-offs, and trade-offs result in conflict because “decision-makers must accept less of one choice attribute to get more of another” (Luce, Payne, & Bettman, 2001: 86). Decision-makers experience intense conflict when faced with “simultaneous opposing tendencies within the individual to accept or reject a given course of action,” the consequences of which involve “hesitation, vacillation, feelings of uncertainty, and signs of acute emotional stress” (Janis & Mann, 1977: 46; see also Tversky & Shafir, 1992). Several of our studies and research elsewhere have found that decision inertia can derive from the inability to choose between two equally attractive or unattractive courses of action (see Alison & Shortland, 2022). When making a choice between two or more competing courses of action that are equally attractive (or equally unattractive), there are two sources of conflict: the first is a concern about sacrifice, and the second is a concern about argumentation. In simple terms, we must be able to argue to ourselves (or to

## Critical Incident Decision-Making

others; see the discussion of accountability above) why we are willing to not experience the benefits of the not-chosen option.

In a series of critical decision method interviews with members of “blue light” services (police, fire and rescue, and ambulance services), Power (2016) found that CIDM often placed “approach goals” and “avoidance goals” against each other. While approach goals influence tendencies to take positive action towards a positive stimulus, avoidance goals encourage individuals to avoid negative effects by moving away from a negative stimulus. Power interviewed 31 command level decision-makers from the Police Service, Fire and Rescue Service, and the Ambulance Service (AS) and asked them to recall a “difficult decision.” The results showed that emergency commanders hold two overarching goals:

1. **Save life:** Goals and motivations associated with approaching positive outcomes from a situation; and
2. **Prevent further harm:** Goals and motivations associated with avoiding anticipated negative consequences.

Power’s research found that these (competing) goals often resulted in uncertainty, goal conflict, passive and active avoidance, and inaction: “The ‘save life’ goal appeared to derail action if the decision-maker experienced goal conflict by trading it off against the competing avoidant goal to ‘prevent further harm’” (Power, 2016: 96). For example, rushing into a burning building to save civilians risks the loss of police/ambulance/firefighter lives. Power (2016) found that emergency commanders are often faced with these two countervailing goals (saving lives of victims versus protecting lives of colleagues), and when a decision-maker cannot decide between them, decision inertia can be the result (Power & Alison, 2017). In our own research with members of the US military, Shortland and Alison (2020) have found that redundant deliberation emerges when individuals are forced to choose between two equally important values. Our findings indicate that when two equally “sacred” (non-negotiable) values collide, a decision-maker who finds each outcome intolerable will fall into the trap of redundant deliberation. By contrast, the ability to identify one clear important goal can protect against redundant deliberation (Shortland & Alison, 2020).

#### **4. Summary**

We have discussed several factors that can result in inaction or delayed action in the context of CIDM. In order to support efficiency in decision-making and plan implementation during critical incidents, police officers (or at least command-level officers) need a basic awareness of these concepts. While all concepts are important, we encourage command-level officers to focus first and foremost on understanding decision inertia, as this is common in CIDM (Alison, Power, et al., 2015; Alison, Palasinski, et al., 2017).

### **V. Pillars of Critical Incident Decision-Making**

Based on our research and experience in critical incident decision-making (and as briefly described in section I above), we propose that effective decision-making in the face of the challenges identified above involves four pillars: situational awareness; time management; the interrogation of assumptions; and revision and resilience.

We outline each of these four pillars in further detail below.

#### **1. Situational Awareness**

As described above, situational awareness is a state in which a decision-maker understands the elements in a specific environment and their relationship to each other, and uses this understanding to guide behaviour. We have outlined Endsley's model of situational awareness, which involves three stages (perceiving, comprehending, and projecting). This model can be usefully applied to consider the way in which decision-makers responding to critical incidents are continually required to encode the elements of a situation, understand their interrelation, and use this to predict whether they need to take (potentially lifesaving) action (Shortland, Alison, & Moran, 2019).

Developing situational awareness is a fragile process and can go wrong, especially when uncertainty is high. In their work on decision errors in real world contexts, Jones and Endsley (1996) found that one common form of error was to incorrectly perceive the situation. In their study in the context of aviation, they observed that failure to observe available information was the largest cause of error (Jones & Endsley, 1996: 507). Furthermore, in aviation accidents in which situational awareness errors occurred, 72% involved level-1 situational awareness errors (failure to correctly perceive some information in the situation), 22% involved level-2 situational

## Critical Incident Decision-Making

awareness errors (in which the data were perceived but not integrated or comprehended correctly), and 6% involved level-3 errors (failure to correctly project what would happen next).

The significance of situational awareness cannot be underestimated. In one study, Orasanu, Martin, and Davison (1998) discovered that most errors stemmed from poor situational awareness. Good situational awareness involves a decision-maker juggling multiple possible explanations for the critical incident before deciding and acting. Furthermore, good situational awareness involves updating our perception of an event as we receive more information as it unfolds. Poor situational awareness, on the other hand, involves picking one possible “story” and sticking to it, despite the emergence of information later that refutes the original assessment (see Hoffman, Ward, et al., 2013).

## 2. Time Management

A crucial part of critical incident decision-making is navigating the decision-making process within the available time window. This involves both not acting too soon and not acting too late. Our own research with police decision-makers has shown that not only is the use of time important, but it can vary between individuals based on a range of personality and experience-based factors. For example, in a series of studies using police decision-makers, we found that the presence of time pressure significantly impacted their ability to come up with hypotheses about a possible crime they were investigating (Alison, Doran, et al., 2013; Kim, Alison & Christiansen, 2020). Furthermore, our research (see below) found that there are significant differences in how much time people invest in the SA phase of decision-making versus how much time they invest in option selection.

Overall, from our observations of training events and naturalistic and experimental research, a relatively small investment of time initially can yield significant benefit in terms of a decision-maker’s ability to assess the situation and see a clearer pathway through (Alison, Power, et al., 2015). In some cases, errors in decision-making can be avoided with a few pieces of information that could have easily been found with a little additional time searching. We note here that it is not simply about spending additional time confirming or additional time planning the course of action. Rather, the time must be used wisely to *probe* what is going on.

While time spent initially can be beneficial for developing situational awareness, continuing to delay action while more information is obtained will eventually cost more (in terms

#### **4. Summary**

We have discussed several factors that can result in inaction or delayed action in the context of CIDM. In order to support efficiency in decision-making and plan implementation during critical incidents, police officers (or at least command-level officers) need a basic awareness of these concepts. While all concepts are important, we encourage command-level officers to focus first and foremost on understanding decision inertia, as this is common in CIDM (Alison, Power, et al., 2015; Alison, Palasinski, et al., 2017).

### **V. Pillars of Critical Incident Decision-Making**

Based on our research and experience in critical incident decision-making (and as briefly described in section I above), we propose that effective decision-making in the face of the challenges identified above involves four pillars: situational awareness; time management; the interrogation of assumptions; and revision and resilience.

We outline each of these four pillars in further detail below.

#### **1. Situational Awareness**

As described above, situational awareness is a state in which a decision-maker understands the elements in a specific environment and their relationship to each other, and uses this understanding to guide behaviour. We have outlined Endsley's model of situational awareness, which involves three stages (perceiving, comprehending, and projecting). This model can be usefully applied to consider the way in which decision-makers responding to critical incidents are continually required to encode the elements of a situation, understand their interrelation, and use this to predict whether they need to take (potentially lifesaving) action (Shortland, Alison, & Moran, 2019).

Developing situational awareness is a fragile process and can go wrong, especially when uncertainty is high. In their work on decision errors in real world contexts, Jones and Endsley (1996) found that one common form of error was to incorrectly perceive the situation. In their study in the context of aviation, they observed that failure to observe available information was the largest cause of error (Jones & Endsley, 1996: 507). Furthermore, in aviation accidents in which situational awareness errors occurred, 72% involved level-1 situational awareness errors (failure to correctly perceive some information in the situation), 22% involved level-2 situational

## Critical Incident Decision-Making

awareness errors (in which the data were perceived but not integrated or comprehended correctly), and 6% involved level-3 errors (failure to correctly project what would happen next).

The significance of situational awareness cannot be underestimated. In one study, Orasanu, Martin, and Davison (1998) discovered that most errors stemmed from poor situational awareness. Good situational awareness involves a decision-maker juggling multiple possible explanations for the critical incident before deciding and acting. Furthermore, good situational awareness involves updating our perception of an event as we receive more information as it unfolds. Poor situational awareness, on the other hand, involves picking one possible “story” and sticking to it, despite the emergence of information later that refutes the original assessment (see Hoffman, Ward, et al., 2013).

## 2. Time Management

A crucial part of critical incident decision-making is navigating the decision-making process within the available time window. This involves both not acting too soon and not acting too late. Our own research with police decision-makers has shown that not only is the use of time important, but it can vary between individuals based on a range of personality and experience-based factors. For example, in a series of studies using police decision-makers, we found that the presence of time pressure significantly impacted their ability to come up with hypotheses about a possible crime they were investigating (Alison, Doran, et al., 2013; Kim, Alison & Christiansen, 2020). Furthermore, our research (see below) found that there are significant differences in how much time people invest in the SA phase of decision-making versus how much time they invest in option selection.

Overall, from our observations of training events and naturalistic and experimental research, a relatively small investment of time initially can yield significant benefit in terms of a decision-maker’s ability to assess the situation and see a clearer pathway through (Alison, Power, et al., 2015). In some cases, errors in decision-making can be avoided with a few pieces of information that could have easily been found with a little additional time searching. We note here that it is not simply about spending additional time confirming or additional time planning the course of action. Rather, the time must be used wisely to *probe* what is going on.

While time spent initially can be beneficial for developing situational awareness, continuing to delay action while more information is obtained will eventually cost more (in terms

of lost opportunities for intervention) than it pays (in terms of gaining relevant information). This phenomenon is sometimes described as the law of diminishing returns or the principle of diminishing marginal productivity. It holds that however much a new activity benefits us, the longer we go on doing it, the less effective it will eventually be (Shepard & Färe, 1974). In the critical incident context, the initial process of obtaining information can be hugely beneficial for understanding the problem at hand. However, this level of “return” may not be sustained over time – that is, the more information we get, the less useful it eventually becomes. This can lead to redundant deliberation (described above), whereby an individual continually seeks more information without significantly improving their understanding of the situation, their options, or the likely outcomes of their options.

We have observed the tendency to defer decisions too long in our own research (van den Heuvel, Alison & Crego, 2012). For example, in the context of a simulated terrorist event, we observed that of the fourteen teams that *did* correctly declare the subject event a critical incident, twelve teams did not declare the incident as “critical” until they received notice of a shooting outside the convention centre. This moment was identified by subject matter experts as being too late.<sup>7</sup> As such, despite making the right decision, most teams waited too long and avoided the declaration decision until they believed they could not avoid it any longer. This is an example of a “novice error” of deferring a decision until the last possible moment (van den Heuvel, Alison, & Crego, 2012).

#### *A. Foxtrot Thinking*

By looking at not just the outcomes of expert decision-makers but the time patterns that they commonly adopt – how long they spend assessing situations, choosing their course of action, and committing themselves to that decision – we have discovered that the ideal approach is what we term “foxtrot thinking”: slow, slow, quick, quick. Our research into how police officers make decisions bears out the effectiveness of foxtrot thinking. In a study involving 96 senior police officers recruited from across the United Kingdom, Shortland, McGarry, et al. (2021) found that those with successful experience making high-pressure decisions in the field tended to take more time to assess a situation but less time to decide on a course of action. We use the term “foxtrot

<sup>7</sup> The subject matter experts in this case were a so-called “silver” command group that included officers with many years of experience, alongside experienced legal and training practitioners.

## Critical Incident Decision-Making

thinking” to refer to an approach whereby the decision-maker initially takes time to carefully assess different options and to call on relevant experience and their internal value system. This is the “slow, slow” stage. Once this information is assembled, and any further information will either take too long to find or will never be available, the decision-maker moves on to the “quick, quick” phase.

### 3. Interrogating Assumptions

In the 1970s, psychologists Amos Tversky and Daniel Kahneman examined how people simplify information to make choices. Their thesis was that people rely on a limited number of possibilities and make assumptions that, though generally helpful, will sometimes undermine the entire process (Tversky & Kahneman, 1974). For example, if event A usually generates event B, individuals tend to make decisions assuming that this is the pattern events will take, but that is only a probability, and every so often event A generates event C. Tversky and Kahneman observed several processes whereby individuals make assumptions that have little basis in probability. For example, when individuals see a crash on the motorway, they will feel they are more likely to be involved in one themselves, even though the fact of having seen it makes no difference to their own odds. Decision-making can be improved when individuals understand that they are imbued with these biases so that they can override unhelpful assumptions rather than allowing them to undermine good judgement (Tversky & Kahneman, 1974). Based on our work with CIDM, we propose the following tactics and principles.

- **Seek the opposite:** Rather than simply looking for information to confirm existing assumptions, actively seek out information that challenges your preferred view.
- **All information matters:** We are all subject to what psychologist’s call “primacy effects,” whereby we value the first piece of information more than any subsequent pieces (Tan & Ward, 2000). But the first piece of information obtained is not always the most useful or relevant. Equally, the final piece of information is also not necessarily the most useful just because it was the last piece of the puzzle.
- **If it’s not black and white, it’s not black and white:** Critical incidents are not simple and rarely have clear-cut causes or solutions. Recognize from the start the probable need for complex and nuanced solutions/courses of action.
- **Allow for dissenting opinions:** Good decision-making is often aided by being able to cross-check information and ideas. Do this across a range of people, not just ones who agree with you.

- **Interrogate your information:** It is important to ask if you have the full picture, or whether there are gaps. Is some of the information inconsistent and contradictory? And have you tested what you assume to be true? Answering these questions will help plug gaps, resolve inconsistencies, and test assumptions. Remember, though, that seeking more information should be a finite process, and there is a trade-off between accuracy and time.

#### 4. Revision and Resilience

In the SAFE-T model of decision-making, T (Team Learning) applies to those situations which are “slow-burn,” meaning they are multi-phased, and within which the decision-maker has the opportunity to implement a decision, learn from the outcome, and self-correct before launching a new decision (Salas, Rosen, et al., 2006). In such cases, decision-makers should continually reflect on and revise assessments throughout the process, allowing them to adapt future responses to fit the demands of a dynamic and volatile situation. This is often facilitated by feedback from team members and the outcomes of decisions that have been implemented (House, Power, & Alison, 2014). Accordingly, the final element of good CIDM is the ability to revise plans and change when a situation requires it.

That said, we often see decision-makers fail to update their plans and revise their strategy. There are two overarching reasons for this. The first is a failure to recognize that the situation has changed. The second is a human preference to maintain the status quo. With regards to the former conflict, Jones and Endsley proposed a three-level taxonomy for classifying and describing errors in situational awareness. The first level of failure is to “incorrectly perceive the situation” (Jones & Endsley, 1996). In these cases, the information may be available to the decision-maker but unattended because of too much irrelevant available information. Issues such as workload can further confound this by decreasing working memory capacity and hence decreasing the number of “slots” available in consciousness to process the relevant information. In other cases, information may simply be unavailable or too ambiguous. However, in a study of 37 aviation incidents in which crew behaviour caused errors (as determined by the National Transportation Safety Board), Orasanu and colleagues discovered that the most common error was to “continue with the original plan of action in the face of cues that suggested changing the course of action” (Orasanu, Martin & Davidson, 1998). Furthermore, these plan-continuation errors accounted for approximately 75% of all tactical decision-making errors. What this means is that the majority of errors stemmed from the inability to either 1) update SA or 2) re-evaluate an already-selected

## Critical Incident Decision-Making

course of action based on a new SA. This astounding statistic underscores the difficulty inherent in quickly assimilating unfolding information and using that new knowledge to change our behaviour; and this literally caused most of the aviation crashes observed (Shortland, Alison, & Moran, 2019).

The second issue with revising plans is the fear of loss. At the heart of our attitude to change is a fear of loss, because change will inevitably involve loss as well as gain – even if we have good reason to hope for a positive outcome (see Alison & Shortland, 2022). Research has suggested there is a neurological predisposition to be attuned to potential loss rather than potential gain (Tom, Fox, et al., 2007). It seems that the brain processes gain in its “reward section” – that is, the part of the brain that is activated, for example, by enjoyment of food when hungry or an unexpected pay bonus. But losses are processed in the part of the brain that is reserved for strong negative reactions, such as disgust or pain. In this sense, when doing CIDM, it is important to consider that cues of potential loss from changing course may appear more salient than cues that speak to the potential gain of revising our approach.

## VI. Selecting Decision-Makers for Critical Incidents

A final relevant thread of research concerns individual aptitudes for good decision-making. It is worth stating that while a large range of psychological research focuses on the role of personality in behaviour, as well as on the role of personality in decision-making in general, there is very little research on how personality impacts CIDM. This likely stems from the fact that the majority of CIDM research involves the observation of individuals making decisions in real or simulated decision-making environments. However, in our own research we have begun to investigate whether certain personality variables are associated with improved CIDM. To support this effort, we developed a research tool called “LUCIFER,” which stands for the Least-worst Uncertain Choice Inventory For Emergency Responders. LUFICER has been developed with support from the Army Research Institute Foundational Science Research Unit, the Combat Capabilities Development Command (CCDC) Soldier Center at Natick, and the Center for Applied Brain and Cognitive Sciences at Tufts University and has been piloted with a range of applied groups (soldiers, police officers, firefighters, etc). It has been used on over 1,000 practitioners across the United States and United Kingdom (Shortland et al., 2020a; Shortland et al., 2020b).

LUCIFER adopts a two-alternative forced choice (2AFC) approach in which individuals are presented with an audio feed (recorded by members of the armed forces or paid actors) that provides them with an assessment of the situation and a required action. LUCIFER operates through an online survey platform (Qualtrics) that allows us to accurately record response times. LUCIFER allows measurement of the following dependent variables, both on average across a range of scenarios and per scenario:

1. **Situational Awareness Time:** Time taken to listen to the decision context and declare they are “ready” to decide
2. **Choice time:** Time taken to choose an option (A or B). This is measured as the time taken to record the last “click” on an option on the page. (Qualtrics recorded both first and last page clicks for each step of the scenario.)
3. **Decision Time:** Time taken to choose and declare they are ready to “commit” (i.e., submit) their choice
4. **Commitment Time:** Time lag between selecting a course of action (Choice Time) and committing to it (Decision Time)
5. **Decision Difficulty:** Participants completed a five-item decision difficulty scale (see Hanselmann & Tanner, 2008) after completing each scenario.
6. **Approach/Avoidance:** Each LUCIFER scenario represents a choice between an approach decision (an active behaviour that makes a positive impact) and an avoidance decision (no further behaviour and to withdraw to prevent further harm). An overall approach/avoidance score was calculated by summing the total number of approach choices made across all scenarios.

Using LUCIFER, we have begun to identify (1) the personality factors that impact individual differences in CIDM and (2) the discrete effects of these personality traits on specific processes within the CIDM process. Below we outline some of the findings of this work, specifically as they relate to the personality trait maximization.

### 1. Maximization

Maximization refers to the individual differences in people’s abilities to sacrifice the “best” possible option for a satisfactory option that is “good enough” – according to their own threshold of acceptability (Schwartz, 2004). Maximizers tend to be perfectionists (Bergman, Nyland, & Burns, 2007; Schwartz, Ward, et al., 2002). In terms of their decision-making strategies, maximizers are less open (Purvis, Howell, & Iyer, 2011), more prone to procrastination (Osiurak,

## Critical Incident Decision-Making

Faure, et al., 2015), and more likely to engage in counterfactual thinking (Schwartz, Ward, et al., 2002).

In three studies, one with soldiers, one with police officers, and one with a control sample, we found that individuals with high maximization levels were slower to choose a course of action, were more avoidant, and found decisions harder (Shortland, Thompson, & Alison, 2020; Shortland, Alison, & Thompson, 2020). Furthermore, in a study in which we used a mindfulness intervention (a process of focusing one's energy inwards that is often used by athletes), we found that the intervention was counterproductive in individuals with high maximization tendencies (Shortland, McGarry, et al., 2021).

In addition to the role of maximization, in a recent literature review conducted for the Defense Science and Technology Laboratory on decision inertia (Musalova et al., 2021), we identified several other personality traits that could also, if tested, be associated with CIDM. It is important to mention, however, that in several of the studies below, decision inertia is defined as the decision to change a currently made decision. This is closer to the concept of adaptation that we outlined above than the definition of decision inertia used elsewhere in this report. That said, these potential personality factors, which will be looked at more closely below, are: a preference for consistency; indecisiveness; and faith in intuition. Despite there being very little research that specifically focuses on these personality traits that may impact CIDM, our work demonstrates that this is an important avenue to consider.

#### *A. A Preference for Consistency*

Inconsistency creates cognitive dissonance regarding contradictions between what was done in the past and what someone is doing now (Festinger, 1962). Dissonance is unpleasant, and the more unpleasant/acute this feeling of dissonance is, the more an individual prefers consistency. Psychologists have formalized this tendency into the preference for consistency scale, which measures how much stress decision-makers experience when they are faced with contradictions in their own behaviour and the world (Cialdini, Trost, & Newsom, 1995). Some researchers have argued that decision-makers commit themselves to the first decision (Pitz, 1969) and then stick to this decision to avoid the anticipated dissonance that would be caused by a deviation from this original choice. However, others disagree with this finding. While Jung, Stähler, and Weinhardt (2018) and Zhang et al. (2014) have found no significant influence of preference for consistency

on the likelihood that decision-inertia occurred, Akaishi, Umeda, et al. (2014) and Alós-Ferrer, Hügelschäfer, and Li (2016) have found that preference for consistency correlates with decision inertia.

### *B. Indecisiveness*

Indecisiveness is the psychological tendency to generally fail to commit to a course of action, across all situations and decisions, in a timely manner (Frost & Shows, 1993). It is driven by (1) a preference for avoidance and (2) a bias towards threat-oriented cognitions and negative affect in response to the presence of a decision (Spunt, Rassin, & Epstein, 2009). Sautua (2017) has reported that indecisive individuals are more prone to decision inertia. Payne, Bettman, & Johnson (1988) found that indecisive individuals were slower to make decisions, and Alós-Ferrer and colleagues have found that there is a positive correlation between decision inertia and decision times (Achtziger & Alós-Ferrer 2014; Alós-Ferrer, Hügelschäfer, & Li, 2016; Alós-Ferrer & Strack, 2014). Berens and Funke (2020) have found that indecisiveness correlates with choice deferral.

### *C. Faith in Intuition*

Faith in intuition is defined as the tendency to rely on heuristics when making decisions (i.e., to rely on the “quick” cognitive rules identified by Tversky & Kahneman, 1974; Alós-Ferrer, Hügelschäfer, & Li, 2017), and it is linked to decision inertia. Jung, Stäbler, & Weinhardt (2018) have found that faith in intuition increases decision inertia, supporting the hypothesis that inertia is driven by an individual’s tendency to rely on heuristic processing.

## **VI. Summary**

Critical incidents are extremely difficult events to respond to since they are unique, hard to train for, often involve demand outstripping resource, often require decision-makers to adapt and be creative and even preclude experienced officers from using prior expertise to respond (since critical incidents are often one-offs). As such, critical incidents often frustrate officers’ response times and efficacy. They are hard to train for, difficult to predict, and require creativity, rapid adaptation, and synchronized coordination. Once a responding agency “falls behind” in its response to such an event, it is often left playing catch up (especially in fast-moving, dynamic, high-risk events).

## Critical Incident Decision-Making

Training can be costly, and our experiences have shown that responding agencies sometimes make the error of massive investment in one or two costly exercises per year to train for critical incidents. Instead, we suggest more frequent, short bursts of cognitive training that focus on frequency over duration and in which facilitation encourages looking at real events that could have worsened if x and y had happened, and then calculating how one might respond in anticipation of those events. Such “grim storytelling” exercises encourage officers to imagine and prepare for worst-case scenarios. This scenario-based training need not be expensive, does not require investment in special equipment and technology, and instead requires buy-in from senior authorities, facilitation know-how, and an allotment of time per week. (We refer to the 7@7 approach that we have used in the past, which results in three 21-minute inputs, or one hour total per week).

An examination of any real-life critical incident, including any public inquiry, must be more than a mere reporting of the blow-by-blow errors and instead focus at least in part on improvement for future CIDM. Simply stating what went wrong (or right) often leads only to the next public inquiry. Instead, we recommend a commitment to training and measurement of the effectiveness of that training. Training needs to be regular, of sufficient duration, and of sufficiently high intensity to stress-test officers’ communication and decision-making skills.

## Appendix A: Sample Scenario with Common Decision Errors

Below we outline a simplified version of the context and “injects/feeds” that we use as a tabletop exercise for examining decision-making under stress. The scenario has been used in the United States and the United Kingdom with university students, junior and senior police officers, military personnel, and individuals in senior leadership roles in government. It does not purport to have operational fidelity, and indeed, “actors” in the scenario typically play roles that vary across the scenario. (Thus, they may be familiar with some but not all roles.) The scenario itself operates at a specific running time, and as such, some decisions (principally at the front end) can benefit from slower, more deliberate thinking, while other decisions (mainly at the tail end) require more speed and tolerance for least-worst outcomes.

Note that the following overview of common errors associated with the scenario is deliberately general. We do not include granular details of participant errors, or specify who makes what decisions at what times. The reason for this is to avoid the risk of exposing errors of particular participants, and therefore compromising the safe learning environment that the scenario is intended to provide.

### OPERATION MINOS

#### Context

While the context of the scenario may vary depending on the audience, training event and purpose, overall, a complete scenario design involves outlining to the participants:

**Who:** We outline who the key decision-makers are, and their command structure (this is tailored to reflect the command structure used by local authorities that are relevant to the participant group) so that each participant knows who they are in charge of, and who is in charge of them, as well as the size of the team and organization(s) they are working with.

**Where:** We outline where the event is occurring and any relevant details of force size, assets, personnel and infrastructure of the organization (this is also tailored to be relevant to the participant group). The objective is to create a local scenario in which the incident will exceed local resources

## Critical Incident Decision-Making

(see 'where' above). For example, central London would have more assets than St Ives (Cornwall) and thus we would variably increase the size of the incident to exceed resources of the subject location.

**Location:** The event is set (initially) at a school (though this may vary depending on requirements). A standard example would be "Oakwood elementary school" which comprises 450 students and 60 teachers. We provide participants with a map and arterial routes as egress and access points as a very basic schematic.

**Incident:** The incident starts with reports of a potential gunman threatening a school. As background the participants learn that the gunman may be linked to an extreme right-wing group (XRW). The officers must then, in parallel, be considering a potential protest by that group.

**Injects**

After establishing the who, where, location and incident outline, participants are subjected to a number of information injects that progress them through the scenario and are, at times, reactive to the decisions they do, or do not, make.

**Inject 1:** A written briefing document is provided that details the community tensions based on some changes involving more diverse religious teaching at various faith schools. The document also notes emerging community concerns about a handful of racist attacks (% increases year on year).

## Critical Incident Decision-Making

**Inject 2:** A pre-recorded audio clip is played which replicates a call from command indicating that an incident has happened at Oakwood elementary school, and that you (a participant) are in command of the incident. The commander says they want updates as soon as possible.

**Inject 3:** A pre-recorded audio clip is played which starts with a police officer giving a briefing to the participants. This recording includes sparse details about an unknown adult male entering Oakwood primary school. There are some 'sketchy' details as to whether the individual is carrying a firearm. There are inconsistencies about who he is, what he wants and contradictory information on what he has done and where he is within the school itself. Then officer provides a pre-recorded audio inject from the adult male (via phone call). This call is hard to make complete sense of because the male speaker sounds distressed and angry and is somewhat incoherent. They are designed to appear in a state in which he has a loaded firearm and will start shooting in one hour unless "Sky News" is called (other major news broadcasting agencies are used in other countries, for example in the USA we may use "CNN").

**Inject 4:** During the phone call from the male suspect, a pre-recorded audio clip is played of the senior commander calling for an update on the situation.

**Decisions and typical errors:** At this point there are a range of 'typical' errors that can emerge. These include, but are not limited to:

- During inject 4, the decision-maker(s) fails to ask the commander to call back or allocate tasks to others (instead, they try to speak to the senior commander whilst trying to encode immediate information)

Critical Incident Decision-Making

- The decision-maker(s) gives an inaccurate briefing to the senior commander. Typically, the decision-maker gets the facts wrong (e.g., name of suspect), or gives overconfident assertions about information that is not verified (e.g., says the suspect is male or does, or does not, have a firearm). Decision-makers also make the error of guessing the number of children in the school.
- The decision-maker(s) fails to be clear about the exact resources that they would like (or fail to ask for resources at all).
- The decision-maker(s) does not ask for obvious and available information (e.g., schematics of building, size of school, maps of areas).
- The decision-maker(s) fails to consider time as critically important.
- The decision-maker(s) are overly optimistic and assume/hope a concession might be made (speak to Sky news) when it cannot.
- The decision-maker(s) fails to deploy teams or assign roles clearly.

These errors reflect poor encoding and retrieval of information, which lead to assumptions about the unfolding event and a failure to test those assumptions through requests for more information. In some cases, decision-makers also fail to accurately consider what the many, and varied, outcomes could be ('grim storytelling') and instead assume a single (often 'best') outcome is most likely.

**Inject 5:** If the decision-maker(s) have not asked for resources yet, they are now given maps and further details of possible resources.

**Inject 6:** A pre-recorded audio is played of an officer calling to saying that an increasing number of protestors associated with an XRW group are gathering within 5 miles of the school. The officer asks for advice on how to proceed next.

**Decisions and typical errors:** At this point there are a range of 'typical' errors that can emerge. These include, but are not limited to:

- A common error is for decision-maker(s) to take their eye off the main task (the school) and get distracted by the growing crowd which they assume is connected to the school incident. They definitively assume that it is connected to the school incident and over resource that event. This depletes the resources they have to respond to the immediate incident. This often stems from a failure to question or test assumptions about the two events.
- The decision-maker(s) fails to phone back and update the senior commander.
- The decision-maker(s) continued poor deployment and role allocation.
- The decision-maker(s) fails to prioritise tasks effectively and ask for more information in order to correct assumptions.
- The decision-maker(s) fails to anticipate a worst case scenario and instead spends too much time trying to address all emerging issues equally. This results in expenditure of efforts across all areas with very little being accomplished in relation to any one problem. Instead, the decision-maker(s) should be prioritising tasks and actions.

Critical Incident Decision-Making

**Inject 7:** A pre-recorded audio of a second phone call from the suspect in the school is played to the decision-makers. This call is even harder to make out and involves the individual sounding even more distressed. The individual on the phone asks for drugs and discusses needing them to calm down.

**Inject 8:** The decision-maker(s) is told that the Armed Response Vehicles (ARVs) and negotiator have arrived on scene.

**Inject 9:** The decision-maker(s) is told that a TPI (third party intermediary) has arrived on scene. The TPI claims to know the suspect and says she was used successfully on a previous case to de-escalate him.

**Inject 10:** A pre-recorded audio phone call is provided from an officer who worked with the TPI on a previous job. The officer says that the TPI was helpful but that it was several years ago.

**Inject 11:** A pre-recorded audio phone call is provided from a social worker who has worked with the suspect. In brief, the social worker gives an account of the suspect's drug habits and mental health status and suggests he has been deteriorating in recent months.

**Decisions and typical errors:** At this point there are a range of 'typical' errors that can emerge. These include, but are not limited to:

- The decision-maker(s) is unable to juggle and cut through a volume of information and loses focus on immediate concerns.
- The decision-maker(s) tries to create an optimal outcome without knowing what the worst case could evolve into.

Critical Incident Decision-Making

- The decision-maker(s) is still failing to create opportunities to firm up situational awareness (where is the suspect, is there a gun, who is in what classroom, who is unaccounted for).
- The decision-maker(s) fails to measure up relative risks and becomes overwhelmed quickly, resulting in failures in delegation and workload management.

**Further injects:** The remaining injects for the scenario vary from one to four more injects and all relate to the placement of the ARV team.

**Decisions and typical errors:** Consistent errors in these stages are failure to seize the opportunity to get visual confirmation of the suspect, and to begin developing a better situational model of the events as they unfold. At one stage, the decision-makers are told that the subject is asleep on the floor. However, decision-makers often spend too long mobilizing and as a result, they miss this 15-minute window for action. In this instance, the common error is a reluctance by the decision-maker(s) to tolerate any level of risk by seeking to view the suspect. This lost opportunity to gather situational awareness leads to further decision inertia.

**Post event injects:** Leaders and teams are expected to give media briefings. Common errors during the post event injects include an unwillingness to give any information or accept any degree of loss/risk/understandable error. This often results in the (mock) media becoming even more hostile and the (mock) community more paranoid / distrustful in the aftermath of the event (whatever the outcome).

## **1.0 INTRODUCTION**

One of the first questions that emerged after the murders that took place in Nova Scotia on April 18 and 19, 2020, was: What was the role played by harmful expressions of masculinity generally, and male violence against women specifically. Even before much was known about the perpetrator, there were calls for an inquiry that would look at the murders through a feminist lens, and for a full exploration of his history of violence against women (Henderson, 2020).

This report does not seek to draw conclusions on the motivations for the murders or how past behaviour may or may not have served as a warning. Instead, it was commissioned to explore the relationship between traditional concepts of masculinity and violence. Doing this requires us to look critically at a broad range of issues so omnipresent that we are often unaware of them.

There is a story: Two young fish are swimming through the ocean, chatting as they do, when an older fish swims by them. “Mornin’ folks. How’s the water?” the older fish asks. The young fish continue swimming looking at each other quizzically. Finally, one breaks the awkward silence, “What the heck is *water*?”

There is a generous body of research supporting the connection between masculinity and violence, and the ways this relationship acts as a deep-rooted and powerful force in our society. Yet the reality of men’s violence continues to persist unchecked, unmanaged, and largely unacknowledged. We are like the fish in the water. Until someone points out the existence of traditional masculine norms, we are unaware of its existence. As a function of this relative

ignorance, while we are aware of the harmful impacts on our communities, we fail to implement societal strategies for healthy change.

### **About the Authors**

We come to this report after decades of working with men and boys. As an experiential educator and facilitator, Brian Braganza has worked extensively with boys and men to disrupt harmful expressions of masculinity and to explore a more compassionate self. Nick Cardone is a Registered Counselling Therapist who specializes in working with men and boys in non-traditional therapeutic settings.

Brian and Nick work together on the innovative T.O.N.E. Project (Therapy Outside Normal Environments), which engages groups of men using outdoor, adventure and experiential-based therapies, incorporating art, drama or music therapy. In bringing diverse groups of men and boys together to explore rigid norms of masculinity, we have found an insatiable hunger to expand the notion of what it means to be a man. Frequently in these groups, there is a collective sigh of relief when men and boys recognize they can set down the armour of traditional masculinity that disconnects them from their emotional lives, from their true sense of self, and from each other.

In this report, we combine our lived experience working with men and boys in Nova Scotia with an in-depth look at the research on conceptions of masculinity, and explore the link between those conceptions and violent behaviour.

**Purpose of the report**

We hope to deepen the Commission’s understanding of masculinity as a complex social construct, and demonstrate how it connects to violence in our communities. We examine how gender expectations placed on boys and men influence their physical, emotional, and mental wellbeing, and all-too-frequently lead to violence. We also look at the limited effectiveness of traditional therapeutic options available to men who seek change, and offer a review of gender-sensitive therapies and interventions available in Canada.

This document will ideally stimulate discussion and increase understanding about the role traditional masculine norms play in perpetuating violence. It should also serve as a call to action with respect to the oppressive and damaging influence of traditional masculine norms and the ways they harm women, partners, families, communities — and, ultimately, men themselves.

While violence is overwhelmingly perpetrated by men, most men do not perpetrate violence. And many of those who do use violence have themselves been victimized at the hands of other men. Our aim is not to demonize all men as perpetrators of violence. At the same time, we believe men can take responsibility for ending violence in our communities by disrupting traditional norms and harmful expressions of masculinity.

We are living through a time when old stories of masculinity are slowly being eroded and actively disrupted. However, these patriarchal stories about masculinity persist and permeate our politics, economics, institutions, and communities.

While patriarchy serves to elevate men, oppress women, children, and members of 2SLGBTQIA+ (Two Spirit, Lesbian, Gay, Bisexual, Transgender, Queer and/or Questioning, Intersex, Asexual and other ways people choose to identify themselves), and BIPOC (Black, Indigenous, People of Colour) communities, men and boys may also suffer beneath the violence of patriarchal masculine norms.

### **Influences**

Our reflections are deeply informed by several thinkers, including Jackson Katz, bell hooks, and Raewyn Connell.

- Katz, a well-known researcher and activist in men’s violence against women, notes how the euphemisms we often use to describe violence perpetrated by men render men invisible. For example, the terms “intimate partner violence,” “gender-based violence,” “violence against women,” and “sexualized violence” do not explicitly state that men are the primary perpetrators.
- Feminist author, academic, and social activist bell hooks has written that the use of “traditional,” as in “traditional masculine norms,” implies that traditions can easily be changed, rather than recognizing how hegemonic masculinity is deeply entrenched in an “imperialist white--supremist capitalist patriarchy.”

- And sociologist Raewyn Connell has done groundbreaking work in understanding masculinity as plural. This notion runs counter to a patriarchal masculinity that seeks to maintain power and control through maintaining a fixed binary of gender identities.

This paper examines how patriarchal, traditional masculine gender norms specifically shape cis-gender boys and men, and how those norms also condone and promote violence against people of all genders in our communities. As a result, while we believe gender is expansive and not binary, and that notions of masculinity are complex and plural, in this document we tend to use the binary terms “boys,” “men,” “girls” and “women.”

Finally, there is extensive research on this topic, and much has been written on it. The purpose of this report is not to act as an exhaustive analysis, but rather to serve as an introduction for the Mass Casualty Commission, designed to highlight the breadth of the subject.

## **2.0 Understanding Traditional Patriarchal Masculinity:**

### **The Diseased Tree Metaphor**

According to Micheal Kimmel (2017), the concept of masculinity is not solely related to being biologically male. Instead, it is vital to underscore that masculinity is a social construct. That is to say, the concept of what it means to be masculine is an idea that was - and continues to be - created and accepted by social groups throughout history. While there are multiple concepts of what masculinity looks like, there is indeed one concept that is dominant over all others. In this document we will call that form, *traditional*, or *patriarchal* masculinity.

One way to understand our dominant concept of masculinity and its effects on men, boys and their families and communities, is by thinking of it as a diseased tree that has become deformed as it grows. We will outline the metaphor in this section. Then we will look more closely at the elements of harmful, patriarchal masculinity, the factors that shape it, the harms it causes to people of all genders, and new ways forward.

#### **Contaminated Soil**

If we think of dominant concepts of masculinity as a tree, it is a tree growing in contaminated soil. What makes it contaminated? Harmful traditional norms and messages, many of them steeped in trauma born of past abuse — often a precursor to violence against women (Learning Network, Issue 16, 2016). Other contributing traumas include witnessing violence and abuse, racialized and generational trauma, and PTSD.

### **Acid Rain**

The tree needs water to live and grow, but the rain which falls is contaminated. The rain here represents the social messaging boys and men receive that reinforces the harmful messages of traditional masculine norms. These messages start with blue paint on the nursery walls and gendered toys which often emphasize dominance and toughness. These messages continue as boys are exposed to traditional feminine norms, which subjugate women as sexual objects available for men's pleasure and dominance.

### **Twisted Roots**

If the soil is devoid of nutrients due to contamination, the tree's needs cannot be met, and the root system sustaining the tree becomes starved and deformed. Similarly, when the genuine social and emotional needs of boys and men are suppressed, the result is an inability for men to form and sustain positive relationships; experience, manage and express emotions; and explore and engage with the community and the environment (<https://helpmegrowmn.org>). When there are no nutrients, roots wither and self-prune, leaving a structurally weakened tree.

### **Unstable Trunk**

Given this lack of nutrients from the contaminated soil, the polluted rain and the deformed roots, the tree trunk is unstable, on the verge of toppling. At the core of this tree are traits and qualities men may experience and yet must suppress and bury from the light of day, in order to maintain their status as male and not risk ostracization and reprisal from other men. These suppressed traits include:

- Vulnerability

- Empathy
- Social-emotional literacy
- True identity
- Low self-esteem
- Shame, grief, despair
- Loneliness
- Asking for help
- Male-to-male compassion

### **Calloused Bark**

The tree bark is gnarled and distorted, and represents the barriers men and boys put up through the behaviours they demonstrate — behaviours like dominance, hyper-sexuality, competitiveness, aggression and lone-wolf independence. These are frequently celebrated in Hollywood action films and in glowing profiles of ruthless CEOs and tech entrepreneurs. This barrier shields the vulnerable core of the man within, and projects as dominance over others. Often fear, grief, sadness, or shame underlie these behaviours, but the calloused exterior hides them.

### **Stressed Limbs**

The branches that grow out from the unstable trunk show signs of distress. In terms of masculinity, suppressing emotional and human states leads to mental and physical distress (Whitley, 2021). This can include the following:

- Depression and anxiety

- Intimacy and relationship dysfunction, parenting issues
- Addiction
- Body image issues
- Alexithymia, or being without words for emotions; this refers to an individual's difficulty identifying and describing their emotional experience (Levant, 2020)
- Loneliness and a lack of healthy social connections that allow for vulnerability and the development of empathy can lead to a variety of stress related illnesses. (Murthy, 2020)

### **Noxious Fruit**

The end result for the tree struggling to grow in contaminated soil, with its deformed roots, an unstable trunk, stressed limbs, and with the harmful social messages raining down relentlessly, is the noxious fruit of violence. When men are not able to identify or communicate emotions, they may be unable to deal with problems constructively. The result may be aggression and violence, both internalized (towards themselves) and/or externalized (towards others).

Other possible harmful responses include: sexual compulsions, substance use, porn addiction, gambling addiction, stress-related illnesses, and early death. Furthermore, men who learned as boys to temper vulnerable emotions into aggression will be more prone to act violently when faced with personal problems and hurt feelings. (Levant, 2020)

### **3.0 Exploring Concepts of Masculinity**

Masculinity exists in the context of a number of systems of oppression which seek to elevate one group of people over another. In this section, we introduce some of the factors influencing dominant Western concepts of masculinity and explore the notion of multiple masculinities.

#### **Patriarchy**

Patriarchal, traditional masculinity is often defined in opposition to the feminine. Patriarchy thrives and maintains its dominance by setting standards for what it means to be a man, or masculine, and what it means to be a woman, or feminine (Becker, 1999, Sultana, 2012). Other terms for these more rigid forms of masculinity include hegemonic masculinity, hyper-masculinity, toxic masculinity, dominant masculinity and/or misogynistic masculinity.

In her 2004 book *The Will to Change*, bell hooks describes patriarchy as follows:

“...a political system that insists that males are inherently dominating, superior to everything and everyone deemed weak, especially females, and endowed with the right to dominate and rule over the weak and to maintain that dominance through various forms of psychological terrorism and violence.”

This “psychological terrorism and violence” is directed not only at women, but also at gender non-conforming and sexually diverse individuals, as well as BIPOC individuals. Men who don’t meet the social expectations of the dominant culture of masculinity are also victimized (Kimmel, 2017). Patriarchal, traditional masculine norms are harmful to everyone.

### **Imperialism and Colonialism**

In Canada, we must also recognize that any discussion on concepts of masculinity is influenced by imperialism and colonialism. Imperialism refers to the policies and ideas which lead to one country's expansion and domination over other countries. Colonialism refers to the practices of settling and exploiting people and resources of other countries. When we talk about racialized and cultural experiences of masculinity, the unspoken assumption is that they are measured against a standard of white bodies and experiences. In *The Macho Paradox* (2006), Jackson Katz reflects on how he used to refer to “our culture” in lectures, and why he changed: “I was talking about white culture because whiteness is the ‘norm’ against which other races/ethnicities are measured.”

### **Multiple Masculinities**

Across history and cultures we find not one singular definition of masculinity, but multiple masculinities (Connell, 2001; Levant, 2020). The relatively recent focus in mainstream society on gender identity — brought to the fore by 2SLGBTQIA+ communities and allies — has broadened our understanding of gender identity beyond the male/female binary.

Even as we expand the notion of gender beyond the binary, a rigid narrative of masculinity and femininity persists and influences much of Canadian culture. As Raewyn Connell writes:

“Different masculinities do not sit side-by-side like dishes on a smorgasbord. There are definite social relationships between them. Especially, there are relations of hierarchy for some masculinities are dominant, while others are subordinated or marginalized, (Connell, 2001).

**Non-Traditional Masculinity: Compassionate, Transformative, Progressive**

If masculinity is viewed as a panorama with multiple expressions, we can also see and experience forms of masculinity that may be deemed as non-traditional, pro-feminist, liberal, progressive, and compassionate — all actively challenging harmful stereotypes of patriarchal masculinity in families, workplaces, and communities.

However, even men who behave in these non-traditional ways are steeped in, and deeply influenced by patriarchal forms of masculine socialization. It is the water we swim in and the air we breathe.

Sometimes men expressing these more compassionate forms of masculinity are seen as connected to their feminine sides. However this continues to reinforce a gender binary in which sensitivity, compassion, and open expressions of grief are seen as inherently un-masculine, while assertiveness, forthrightness and strength are seen as inherently un-feminine.

**Defining Norms of Traditional Masculinity**

In the early 1990s , psychologist Ronald F. Levant developed the Male Role Norms Inventory (MRNI), a list of defining characteristics for traditional masculinity. These norms relate to “messages, stereotypes, and social instructions related to manhood that supersede merely being born male or identifying as a man” (Heilman & Barker, 2018). Meanwhile, another notable psychologist, James R. Mahalik, researched men’s adherence to these norms, and developed the

Conformity to Masculine Norms Inventory (CMNI). Since the MRNI was developed, Levant has continued to refine and develop this tool to improve its reliability and validity.

Generally, research shows the more men adhere to these traditional masculine norms, the greater the chance they will suffer from mental or physical distress (Blazina and Watkins 1996; Cournoyer and Mahalik 1995), and the less likely they will be to seek help (Addis and Mahalik, 2003).

**Conventional Masculine Norms and Roles**

The first two columns in the table below show items in the MRNI and CMNI indexes. Column 3 is a compilation of what men in the T.O.N.E. Project in 2016 identified as traditional behaviours of masculinity. Column 4 lists what a group of racialized boys (mostly of Arab descent) at a Halifax high school named when asked what it means to be a man in 2018.

<b>Male Role Norms Inventory (MRNI-SF) Levant (1992)</b>	<b>Conformity to Masculine Norms Inventory (CMNI) Mahalik (2003)</b>	<b>T.O.N.E. NS Compilation list of behaviours of men</b>	<b>Racialized Boys in NS when asked what does it mean to be a man?</b>
Avoidance of all things feminine	Power over women	Fear and dominate women; not doing things women do; don't cook or take care of children; stay at home dads are not accepted	

Restricting expressions of emotions specifically vulnerability and caring	Emotional Control	Emotionally inexpressive; unphased by trauma; don't cry; one dimensional; unaffected by mental illness	Don't cry in front of people; control anger; be serious
Self reliance through Mechanical Skills	Self-reliance	Do all the handy things; don't ask for help; fix-it guy; know what to do	Take care of yourself and others
Toughness	Violence	Violence is the answer; thick skin; fighter; enforcer; you can't hurt me emotionally or physically; badass; short-tempered; insensitive to violence	Tough; don't care what people say
Dominance	Dominance	Be aggressive; don't back down; deep voice; authoritarian	Person who makes decisions; big, tall, strong, beard; strong voice
Importance of Physical Sex	Playboy	Womanizer; sex symbol; sexually dominant; sleep around alot; stud vs slut; virile and high sex drive; buff	
Distain for sexual minority men (Gay, trans, bisexual)	Disdain for homosexuality	Don't be gay/fag; be straight; don't be anything but hetero	
	Winning	Be a winner; be good at sports, competitive; jock	Have a brain
	Risk Taking	Drink a lot; drive fast; do drugs	Drive fast

	Primacy of work	Breadwinner; provider; put food on the table	Have a job; be responsible for the house; be responsible for your family
	Pursuit of status	Make all the money; be in the military; fiercely independent; wear a suit	Have money (rich); house, car
			Respectful, patient, strong, honest, don't lie, good communication

In examining this table, we can easily see the commonalities among the columns. In the second row we see an emphasis on restricting or suppressing our emotional lives. In the fourth column, in the responses from the ethnically diverse group of boys, we see an additional row which names honourable traits such as being “respectful” and “patient.” These generally are not mentioned by teen boys who identify as white. Data from all four columns indicate these norms have a substantial influence on the decisions men and boys make, and how they show up in the world.

It is important to understand that some of the behaviours identified by the men and boys in columns 3 and 4 are not inherently bad. Behaviours reinforcing the notion of being a provider, being independent, or being competitive and good at sports can be honourable. There is nothing wrong with boys and men wanting to drive four-wheelers, go hunting, fix vehicles, or play football. Important life skills can be gained in pursuing these activities. While these activities or

traits they represent are not problems, if they begin to limit our full expressions of who we are — if we become defined by these traits or activities alone — then that can be problematic.

When traditional masculine norms are linked to the domination of women and other bodies, or to self-harm and violence (eg, “If I work out and use steroids to get a ripped body, I’ll get more women.”) they become unhealthy expressions of masculinity.

### **Masculinity in Racialized Communities**

Traditional concepts of masculinity intersect in a variety of ways with the messages racialized men and boys receive. BIPOC men get the message that they don’t matter, don’t belong, and are less worthy than white men. They are seen as deviant, criminal, inferior, and inherently dangerous (Lowman, 2020). BIPOC men will never conform to the hegemonic masculine patriarchal image because of their skin colour. So these traditional masculine norms greatly reduce the self-esteem and self-worth of racialized boys and men, who then feel pressure to work harder in an attempt to reach an unattainable goal.

In Canada, racialized newcomer men and boys often face a culture clash when settling into Canadian society. If they are from a culture where being the sole provider and breadwinner for the family is the norm, they can be disoriented in face of a culture that ostensibly values women’s equality and independence, and women working outside the home. And their social and economic standing may be diminished if their foreign credentials are not recognized, or if they have difficulty learning English.

Newcomer men may also face isolation and pressure from family back home to maintain and assert their cultural values and ways of being. As a result of these stressors and strains, husbands and fathers may assert entrenched notions of masculinity in order to bolster their esteem, confidence and position in the family. This is frequently done in ways that are not helpful and can lead to mental distress — and potentially to intimate partner violence. (White Ribbon, 2018)

### **Masculinity and Rurality**

While there is limited research specifically on traditional notions of masculinity and rurality, there are a few noteworthy studies that explore these dynamics. These are particularly germane in Nova Scotia, which remains a largely rural province.

According to a Canadian study called “Rural Men’s Health, Health Information Seeking, and Gender Identities,” gender roles tend to be more rigid in rural communities, in which the man is traditionally still seen as the breadwinner and the woman maintains the home. Men are often encouraged to seek employment that elevates their physicality, while women’s roles are diminished (Hiebert et al, 2016). The study refers to this heightened gender rigidity as “hegemonic rural masculinity.”

In terms of health, men are less likely to report depression or other mental health concerns, yet addiction and suicide rates are higher among rural men than those in urban areas (Herron et al, 2020; Hiebert et al, 2016). Rural patriarchy also encourages violence as a method of maintaining gender dominance. (Carrington and Scott, 2008)

The Canadian rural men's health and gender study also describes a "romanticized rural masculinity" featuring "rugged men who conquer nature with brute strength."

#### **4.0 Why Do Men Adhere To Traditional Masculine Norms?**

In this section, we look at some of the reasons men continue to adhere to traditional masculine norms, even at great personal cost.

##### **Lack of Awareness and Opportunities to Investigate and Challenge Traditional Forms of Masculinity**

In Canada, most men and boys do not have a safe and supportive forum to investigate masculine norms and their effects on health, wellness and relationships. As stated already, in many cases boys and men do not even know of the existence of traditional masculine norms and their influence on male's behaviours. This is consistent with patriarchal masculinity's drive to perpetuate itself, that if it can remain invisible it will perpetuate its power and privilege. And yet, given the right conditions — including healthy male role models, and a space that allows for exploration and vulnerability and that actively challenges traditional norms — boys and men have shown they are hungry to examine and disrupt these masculine scripts. This can lead to opportunities to reconstruct a more helpful version of masculinity — one which no longer perpetuates harmful beliefs, habits, and behaviours.

However, in the absence of such opportunities, boys look to role models (including YouTubers, musicians, actors, and athletes) for models of what it means to be a man. Meanwhile, adult men may often feel they need permission to show up in ways that are vulnerable, self-reflective and thoughtful.

**Policing of Masculine Norms and the Risks of Deviating**

In many male-dominated social environments, the rules of traditional masculinity are clear and rigid, and any deviation will be ruthlessly policed and suppressed. Many men fear being ridiculed, ostracized, ousted from the group, and even physically attacked if they speak out against aberrant masculine behaviours. This policing happens through peers, mentors and role models, and parents, (Katz, 2006; Levant, 2020), and may also include women. A mother wanting to ensure her son survives and thrives in a patriarchal society may diminish empathetic loving qualities in a boy and nurture more traditional masculine behaviours (hooks, 2004).

**Maintaining Positions of Power and Privilege for Men**

From the birth of first wave feminism over a century ago, to the #MeToo movement which started in 2017, many have worked tirelessly to raise awareness and highlight the harmful impacts of masculinity, while also seeking to shift masculine norms and the ways they are perpetuated. Yet in most countries, these traditional norms remain well entrenched in male-dominated political structure, in corporate boardrooms, in amateur and professional sports, and on the schoolground. As the primary purpose of patriarchy is to concentrate power, authority, leadership and moral decision-making among men (primarily white men), it is reasonable to state that those primarily responsible for perpetuating traditional masculine norms are those who most benefit from them. This “dominant group is rarely challenged to even think about its dominance” (Katz, 2012), because the dominant culture maintains power and privilege by largely remaining invisible and unexamined.

### **How Traditional Masculine Norms Are Perpetuated**

Boys are not born with characteristics of male norms, but are socialized to adopt them. Messages around what it means to be a man are internalized as a function of the beliefs and expectations of a social group (Addis & Cohane, 2005; Levant & Pollack, 1995; Mahalik, Good et al., 2003; Pleck 1981). They then become reinforced, maintained and policed by family, schools, peers, and media influences. They may also differ, based on social and cultural subgroups (Addis & Cohane, 2005; Wester & Vogel, 2012).

In Canada, it is easy to find representations of these traditional norms in a variety of settings and contexts. These include the following:

- Close relationships: Peers, family, educators, sports coaches, other relationships, role models and social groups
- TV, movies and streaming services
- Video games
- Advertising
- Social Media
- Mainstream pornography
- Competitive team sports culture (both recreational and professional)
- University fraternity and dormitory culture

On a more extreme end and yet growing in prevalence in Canadian culture as an influencer of Traditional Masculinity, is the rise of White Supremist-Neo-Nazi groups and online Incel (Involuntary Celebate) communities. These groups are often explicitly rooted in misogyny,

hatred, and racism. These groups are also explicit about their use of violence to achieve their purpose and have a strong online presence that draws in mostly white male-identified individuals who are searching for community and belonging.

While there are emerging cultures challenging these entrenched masculine norms, many social groups and institutions continue to uphold a rigid concept of traditional masculinity.

## **5.0 Harmful Impacts Of Traditional Masculinity**

“The male has paid a heavy price for his masculine ‘privilege’ and power. He is out of touch with his emotions and his body. He is playing by the rules of the male game plan and with lemming-like purpose he is destroying himself—emotionally, psychologically and physically.”

Herb Goldberg, *The Hazards of Being Male*, 1977

In this section, we look at how traditional masculine norms hurt men, as well as their families, their friends, and communities at large.

### **Harm through Conformity**

Behavioural researchers since the 1950’s have written extensively about the mental, emotional and physical impacts of social conformity.

An initial level of harm in the male socialization process is the loss of individuality and authenticity. The harmful impacts of this process have been extensively researched and well documented. Two main theories encapsulate the internal and external harm caused by this process: *Gender Role Strain* (Pleck, 1981, 1995) and *Gender Role Conflict* (O’Neil, Helms, Gable, David, Wrightsman, 1986).

- **Gender Role Strain** theory posits that men experience mental and emotional distress when they cannot meet the expectations of traditional masculine norms while simultaneously addressing their own authentic emotional and interpersonal needs. For example, the need to rely on another for emotional support stands in contrast to the male norms of emotional control and self-reliance.

- **Gender Role Conflict** suggests that adherence to masculine norms leads to thoughts, feelings, behaviours and values that create inner conflict because they contradict familial and societal norms. For example, the masculine norm emphasizing sexual prowess may stand in contrast one’s family or social values of respecting self and others.

Regardless of whether masculine norms are internally or externally enforced, the psychological drive to act is powerful enough to lead to harmful outcomes. As Goldberg says above, the mental, emotional and physical costs are indeed a heavy price.

**Mental and Physical Health Outcomes**

Harmful expressions of masculinity and their negative impacts exist on a spectrum.

As noted previously, there are various standardized measures of masculine norms. These objective measures examine a man’s *beliefs* or *adherence* to masculine norms. The chart below shows the 11 norms of the Conformity to Masculine Norms Inventory (CMNI) in the column on the left. The right column connects these norms to some of their harmful expressions. Please note that while we are using the CMNI, other equally useful and validated comparable measures have been developed. This list is a summary, and is not intended to be exhaustive.

Conformity to Masculine Norms Inventory (CMNI)	Harmful Expressions of Each Norm
--	----------------------------------

Power over women	<ul style="list-style-type: none"> <li>● assumption of dominance or greater intelligence</li> <li>● control</li> <li>● physical, mental, emotional, financial, sexual abuse</li> <li>● sexual assault</li> <li>● sole responsibilities for family/home, leading to increased stress</li> </ul>
Emotional Control	<ul style="list-style-type: none"> <li>● not showing weakness</li> <li>● difficulty communicating emotions (alexithymia)</li> <li>● limited range of emotional expression</li> <li>● mental, emotional, and physical strain</li> <li>● low self esteem</li> <li>● self-medication (alcohol, substance, porn, gaming)</li> <li>● limited capacity for intimacy and dysfunctional relationships</li> </ul>
Self-reliance	<ul style="list-style-type: none"> <li>● not asking for help</li> <li>● seeing only one right way to do things</li> <li>● withholding</li> <li>● not seeking medical advice</li> <li>● fix-it-yourself ethic</li> </ul>
Violence	<ul style="list-style-type: none"> <li>● a coping strategy</li> <li>● seen as the only alternative</li> <li>● a tool for solving problems</li> <li>● a mask for vulnerability and fear</li> </ul>
Dominance	<ul style="list-style-type: none"> <li>● drive to be powerful (financially, physically, sexually)</li> <li>● using various expressions of power to set one's self above others</li> <li>● seeing oneself as better than those not fitting masculine norms</li> </ul>
Playboy	<ul style="list-style-type: none"> <li>● expectation to have a lot of sex whenever or however</li> <li>● non consensual sex</li> <li>● women as sexual objects</li> <li>● ego dependent on sexual conquests</li> <li>● body image pressures</li> <li>● scorecard of conquests</li> </ul>

Disdain for homosexuality	<ul style="list-style-type: none"> <li>● seeing anything that doesn't fit masculine norms as lesser (ie, more feminine or gay)</li> <li>● use of "gay" or "fag" as derogatory terms</li> <li>● gay men seen as not real men</li> <li>● violence against 2SLGBTQIA+ people</li> </ul>
Winning	<ul style="list-style-type: none"> <li>● doing whatever it takes</li> <li>● being number one</li> <li>● winning to the detriment of your own values</li> <li>● sacrificing health, family and/or relationships</li> <li>● cheating, subversion, intimidation as tools of winning</li> </ul>
Risk Taking	<ul style="list-style-type: none"> <li>● high-risk behaviours to establish status (alcohol, drugs dangerous driving, high-adrenaline activities)</li> <li>● thinking "it won't happen to me"</li> <li>● ultimate sports</li> <li>● high-risk sex</li> <li>● poor hygiene practices</li> </ul>
Primacy of work	<ul style="list-style-type: none"> <li>● workaholism</li> <li>● pressure to be the provider</li> <li>● sacrificing health, family and/or relationships</li> <li>● transgressing moral codes (cheating)</li> <li>● expectations to prioritize work</li> <li>● financial worth as a measure of success</li> <li>● putting others down to climb the ladder</li> </ul>
Pursuit of status	<ul style="list-style-type: none"> <li>● importance of looking good in the eyes of others</li> <li>● needing to be buff</li> <li>● body image issues</li> <li>● highly judgmental of others to elevate status</li> <li>● high standards and self-judgment</li> <li>● drive to feel power over others and be the boss</li> </ul>

Adherence to this cluster of male traits comes at a cumulative cost (Seidler et al, 2016; Mahalik, 2003).

**Harmful Outcomes: National and International Statistics**

The figures below come from a staggering amount of data collected by Statistics Canada and published in surveys and reports since 2010.

Compared to women, men and boys face disproportionate rates of the following harmful outcomes:

- 75-80% of suicide deaths
- 77% of homicide deaths
- 86% of perpetrators of homicide
- 94% and 83% of incarcerations (federal and provincial)
- 100% mass/school shootings
- 77% of overdose deaths
- 65% of people experiencing homelessness
- 80% perpetrators of intimate partner violence

In addition, men are:

- 2 times more likely die in automobile accidents
- 2 times more likely to struggle with addictions

Globally, the situation is similar. Recent World Health Organization (2018) reports examining the underlying causes behind poor health outcomes for men and boys note the following contributing factors:

- Increased high-risk behaviours (alcohol, drugs, interpersonal violence, etc)
- Poor health maintenance (diet, exercise, stress management, etc)
- Lower usage of health services

We note that these three factors are also directly linked to roles of traditional masculine gender norms in the table above.

## **6.0 Impact Of Traditional Masculine Norms**

### **On Help-Seeking Behaviours**

Men and boys tend to not seek help for their physical or mental well-being when they need it.

We explore some of the reasons in this section, and look at the far-reaching impacts.

Unfortunately, even when men do reach out for help, factors like attrition rates and negative attitudes towards services, (especially for mental health) lead to worse health outcomes (Cottone, Drucker, & Javier, 2002; Doherty & Kartalova-O’Doherty, 2010; Nam et al., 2010).

### **Statistics on Help-Seeking Behaviours**

How can we measure the rates at which men do not show up for help? Looking at the data on men who do reach out offers some revealing insights:

- 34% of all those who actually seek psychological support from a therapist identify as male (Bedi, 2015);
- 60% of men do not consult a physician for regular physical care, only accessing the medical system when conditions deteriorate (Terlizzi and Norris, 2021);
- Women are 33% more likely to seek medical support than men. (Brett and Bert, 2001)

These trends have remained consistent in the health literature for many decades. If we consider the statistics on suicide, overdose, and homicide, rates, as well as the perpetrators of mass shootings, we can see men are in great need of support. Yet they struggle to access or remain engaged in care.

### **Poor Help-Seeking Behaviours As A Result Of Traditional Masculine Norms**

In examining poor help seeking behaviours we will focus our attention on the following traditional masculine norms, however we also understand that all the norms intersect and influence the health and well-being of men and boys:

- Emotional Control
- Risk Taking
- Self-Reliance
- Dominance

The attitudes and behaviours that emerge as a function of these norms have a direct correlation to the readiness, willingness and ability of men to seek and sustain help for their physical and mental health (Addis & Mahalik, 2003; Wang et al., 2007). The table below names four masculine norms and the associated attitudes or behaviours, this list is not exhaustive:

Traditional Masculinity Norms	Attitudes and Behaviours
Emotional Control	<ul style="list-style-type: none"> <li>● don't talk about my feelings</li> <li>● don't cry</li> <li>● suck it up</li> <li>● don't be gay, don't be a pussy</li> <li>● I'm fine</li> <li>● man up</li> </ul>
Self Reliance	<ul style="list-style-type: none"> <li>● I've got this</li> <li>● I don't need help</li> <li>● it's not that bad</li> <li>● go it alone, deal with it yourself</li> </ul>
Dominance	<ul style="list-style-type: none"> <li>● grow a pair</li> <li>● tough it out</li> <li>● don't show weakness</li> <li>● doesn't happen to me</li> <li>● it's their fault, it's not my fault</li> <li>● violence gets me what I want</li> </ul>
Risk Taking	<ul style="list-style-type: none"> <li>● ignore the pain</li> <li>● it's not that bad</li> <li>● when I'm high I don't think about it</li> </ul>

In the men's health literature, this is referred to as the 'double-bind'. For example, while a man might feel that mental health support services could be helpful for something he is struggling with, the idea of reaching out is already stigmatized in many social circles. Additionally, doing so stands in contrast with the messaging of male gender norms. Caught in a loop between these two conflicting messages, a man may feel psychically stuck. And as his health worsens, this unhealthy belief system further fuels the mobius loop of ill-health (Rochlen and Rabinowitz, 2014).

### **Men's Experiences of Trauma**

Trauma is defined as mental, emotional or physical events that are distressing or disturbing. Trauma can be experienced as either acute (single event), chronic (recurring), or complex (multiple types of trauma). While there is a spectrum of severity, trauma is internalized differently by different people. Most people will experience at least one traumatic event in their lives.

According to the Adverse Childhood Events (ACE) Study (1998), there are 10 general types of traumatic events experienced by children:

- Physical Abuse
- Sexual abuse
- Emotional abuse
- Physical neglect
- Emotional neglect
- Mental illness

- Divorce
- Substance abuse
- Witnessing violence against your mother
- Incarcerated family member

The severity and number of these events have a direct correlation to physical and mental health outcomes in adulthood. They most commonly manifest as follows:

- Alcohol and drug abuse, as well as an increased risk of smoking
- Depression
- Sedentary lifestyle, which can lead to obesity, and heart-related illness and stress
- Employment difficulties
- Health issues such as diabetes, cancer, heart disease, and stroke
- Higher risk of contracting an STD/STI
- Attempting suicide

Since the ACE Study refers to traumatic events experienced in childhood, according to the US National Centre for PTSD, as children transition into adulthood, we know that men are more likely to experience trauma. (<http://ptsd.va.gov>)

### **Post-Traumatic Stress Disorder (PTSD) and Hyper-Masculine Environments**

While adult men are more likely to experience traumatic events (such as incarceration, self-inflicted violence including suicide attempts, violence from others, witnessing violence etc.),

women are 2-3 times more likely to experience PTSD (Olf, 2017). However, it is hard to determine the prevalence of PTSD in men, given the influence of traditional masculine norms on poor help-seeking behaviours. There may be a lot of men with undiagnosed PTSD, particularly in military and first responder sub-cultures, often referred to as hyper-masculine work environments. Here, we see greater expressions of masculine norms such as emotional control and self-reliance. Consequently, fewer men in these environments tend to seek support for the traumas directly associated with their work, or the lingering effects of adverse childhood events, let alone the daily stressors we all experience.

First Responder and Military systems understand the impact of operation stressors and vicarious trauma and yet are just beginning to meet the unique mental health needs of their primarily male workforce with adequate support. This slow to respond attitude is in part due this hyper-masculine culture (Scheinfeld et al, 2016).

### **Racial Trauma**

Racial Trauma, or Race-based Traumatic Stress (RBTS), refers to the mental and emotional injury caused by experiencing racial bias, ethnic discrimination, racism, and hate crimes. “Any individual that has experienced an emotionally painful, sudden, and uncontrollable racist encounter is at risk of suffering from a race-based traumatic stress injury.” (Carter et al, 2013)

While it is beyond the scope of this report to fully explore Race-based Traumatic Stress and its impacts on men and boys, we hope the following serves as a starting point for understanding the immeasurable impacts of race-based trauma and generational trauma perpetrated by white supremacist culture on BIPOC bodies — particularly men and boys.

- “At the root of these inequities, racial discrimination emerges as a major determinant affecting the overall well-being of Indigenous individuals and populations. Historical and contemporary trauma resulting from loss of land, lack of governance, marginalization, incarceration, residential schools, abuse and violence intersect to dramatically affect the mental health of Indigenous people in Canada” (Loppie, Reading & de Leeuw, 2020).
- “...the rate of Indigenous male offenders remains eight times higher than that of non-Indigenous men. The number of Indigenous male offenders continues to increase while the number of non-Indigenous male offenders has decreased slightly” (Clark, 2019).
- “The traumas that live in many Black bodies are deep and persistent, they contribute to a long list of common stress disorders in Black bodies, such as post (*pervasive*) traumatic stress disorder, learning disabilities, depression and anxiety, diabetes, high blood pressure, and other physical and emotional ailments.” (Menakem, 2017 pg 15)
- “...the participants (*newcomer boys*) spoke about how experiences of war and violence may lead, contribute to, or exacerbate trauma and mental health conditions, including post-traumatic stress disorder (PTSD), conduct disorders, attention deficit hyperactivity disorder (ADHD), disassociation, and attachment disorders.” (Hilario et al, 2021)
- “...despite struggling with mental health issues and trauma, Syrian refugee men were less likely than their female counterparts to access mental health services due to the stigma. When they do seek out help, it is more likely to be from peers but there is often a lack of formalized peer support networks for men and boys. In fact, there is a shortage of services specialized for men and boys. The marginalization and lack of support of unaccompanied boys and men can also lead to addiction or substance abuse.” (AMSSA, 2019)

## **7.0 How Traditional Masculine Norms Condone And Promote Male Violence**

When I first began looking at gender issues, I believed that violence was a by-product of boyhood socialization. But after listening more closely to men and their families, I have come to believe that violence is boyhood socialization. The way we “turn boys into men” is through injury...The very phrase “Be a man” means suck it up and keep going. Disconnection is not fallout from traditional masculinity. Disconnection is masculinity.

Terrence Real, quoted in bell hooks, *The Will to Change* 2004

A number of the masculine norms highlighted in the “Exploring Concepts of Masculinity” section directly state or imply violence as a norm of behaviour. Violence, toughness, dominance, power over women, disdain for sexual minority men, risk-taking, pursuit of status, and winning: these all imply that men are required to demonstrate their manliness as toughness and physical or emotional strength, with an emphasis on violent action if required.

A review of the literature shows that violence is inherent in patriarchal traditional masculine norms in North America. Any deviation from these norms implicates men as feminine, 2SLGBTQAI+, weak, and essentially *not men*. This puts those who deviate from these norms at risk of violence from those who adhere to them.

The prevalence, acceptance and even expectation of men’s violence is condoned and promoted in various media sources including, but not limited to, those listed below.

**Hollywood Films**

It is easy to point to hyper-masculine figures like Rambo, Dirty Harry, and the Terminator in action films of the 70s, 80s and 90s. But have things changed? Five of the seven top-grossing movies of 2021 have main characters, primarily men with limited emotional ranges, who demonstrate traditional norms of masculinity through violence, guns, and fast cars. Typically, women are highly sexualized, and frequently seen as objects. The top seven films are as follows:

- *Spider-Man: No Way Home* (Marvel)
- *Shang Chi and the Legend of the Ten Rings* (Marvel)
- *Venom: Let There Be Carnage* (Marvel)
- *Black Widow* (Marvel, female superhero lead)
- *F9: The Fast Saga* (Fast and Furious franchise)
- *The Eternals* (Marvel, female and non-traditional male leads)
- *No Time To Die* (James Bond franchise)

Source: The Numbers (website), 2021

**Video Games**

Three of the five top-selling video games in the US in 2021, involve assassin and first person shooter characters. The top five games are as follows:

- *Call of Duty: Vanguard* (First-person shooter)
- *Call of Duty: Black Ops: Cold War* (First-person shooter)

- *Madden NFL 22* (Sports)
- *Pokemon: Brilliant Diamond/Shining Pearl* (Fantasy/Adventure)
- *Battlefield 2042* (First-person shooter)

Source: Grubb (In VentureBeat Online), 2022

### **Mainstream Online Pornography**

Boys and men have unfettered access to free mainstream online pornography. This includes violent, misogynistic and non-consensual porn found at Canadian-based Pornhub, the largest porn site in the world (Kristof, 2020). Online porn is by far the primary source of male socialization for many teen boys (Katz, 2021).

Media literacy and masculinity expert Jackson Katz says it's not so much that exposure to this kind of violence in film, video games and pornography means young males will want to mimic these behaviours. Rather, the repeated images reinforce the message of hegemonic masculine norms and desensitizes young men, (Katz, 2021). Individuals see and experience the messages that *Violence is manly*, and *if you're not violent, you're not a man* so frequently that they become embedded in boys' (and girls') understanding of maleness. In addition, women, are often seen in these media sources as being available to men primarily as objects to satisfy sexual and violent desires. These repeated images and messages normalize violence and misogyny as masculine. Many researchers have argued violence is not a choice for men and boys; it's a requirement for being included in the culture of men.

### **Victims of Male-Perpetrated Violence**

Men who adhere to traditional patriarchal masculine norms also receive clear messaging as to who should be on the receiving end of their violence. Norms like *power over women*, and *disdain for sexually minority men* mark women and 2SLGBTQAI+ individuals as potential victims of men’s violence. Male violence can also be extended to any other men who do not match up with the norms of masculinity: Men who choose not to embrace these patriarchal norms, men deemed “weak,” men with disabilities, and all men who are not white are all at greater risk of violence from other men.

### **Loss Of Emotional Connection Leads To Violence**

As we have seen, many norms enforce and reinforce violent and aggressive masculinity. However, other masculine norms promote and condone violence as well. These are the norms that suppress, minimize and “kill off the emotional parts” of boys and men. They insidiously promote and condone self-inflicted violence. bell hooks puts it this way: “The first act of violence that patriarchy demands of males is not violence toward women. Instead patriarchy demands of all males that they engage in acts of psychic self-mutilation, that they kill off the emotional parts of themselves” (hooks, 2004).

A vast array of human emotional states are available to men and boys. According to the Centre for Nonviolent Communication, the *Feelings Inventory* (2005), a non-violent communication tool, lists 258 feelings. Yet the Masculine Norms Inventories consistently show the suppression of emotions, boys and men receive regular messaging from peers, media, and elders to suppress and deny their whole range of emotions. These messages underpin the belief that showing

emotion equates to weakness and means you are not a real man. The corollary is that the only emotions available to men are anger, aggression, and rage (Levant, 2020).

What is ultimately painful is that men and boys *do* feel all the emotional states available to them. But they have few opportunities to express and process these emotions out loud with supportive peers, therapeutic support or in community settings.

So what can men do with this plethora of emotions they are not allowed to feel? Author and social activist Parker J. Palmer writes: “Violence is what happens when we don’t know what else to do with our own suffering” (Palmer, 2011).

Men’s suffering is a deep loneliness, a disconnection from self and others, as they try to navigate the trials, tribulations and traumas of everyday life. The norm that men are supposed to be self-reliant means that when deep suffering arises, men are not encouraged to reach out for support from a counsellor or a partner — and definitely not from another man. In times of emotional or mental distress, the emotions that are condoned and promoted are to be angry and to perpetrate violence as a means of eliminating or masking the suffering. Violence may be internalized, as alcohol or chemical consumption and dependence, video game addiction, workaholism, and other harmful behaviours. When the violence is externalized it results in the suffering of others. These violent acts are then seen as a measure of a man’s dominance and control, which reinforces this view of masculinity, continuing the cycle.

**Internalized Violence** can occur when men rigidly adhere to traditional masculine norms and don't have the capacity, emotional literacy or social support network to examine, process and heal from the personal and social distressors in their lives. They feel they need to fix it themselves, often leading to addictive behaviours as ways to self-medicate or numb suffering.

These behaviours are not only harmful to the individual, they also ripple out to harm loved ones who witness these self-destructive behaviours, and are often at a loss for how to help, or are pushed away when they do offer help.

The most tragic outcome of men trying to fix their suffering themselves is suicide.

“...Suicide is self-directed violence... In many cases, suicidal ideation is connected to a failure to live up to the demands of ‘being a man,’ perhaps related to financial success, one’s sexuality, or another characteristic” (Heilman & Barker, 2018).

Attempted suicide in adolescence and adulthood is linked to child maltreatment, and is particularly high among boys with victimization experiences (Etherington and Baker, 2016).

Men are more successful at completing suicide than women, in part, because men use more lethal means, and the second is that they tend to avoid seeking support for mental distress (Varin et al, 2021). In male sub-groups (Indigenous, gay, transgender, military, men going through divorce, etc) suicide rates increase, (Ogrodniczuk et al, 2020).

“Harmful gender norms may often lie at the root of suicidal ideation and suicide. Societies that ‘gender’ the heart such that men are told to cut off their inner lives, to repress their emotions, and to be hard-shelled workers, protectors, and lone providers contribute to a crisis of connection among men. This lack of social connection, or undermining of men’s emotional lives, can be part of the groundwork for suicidal ideation, a form of patriarchal violence of its own.” (Barker, 2016; Way, 2011).

**Externalized Violence** as defined by the World Health Organization is, "the intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community, which either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment, or deprivation" (WHO, 2002). In many cases, men's violence against others is a means, not an end (Katz, 2021), and is often seen as a way to satisfy an unmet need. For instance, violence may be a way to temporarily bolster confidence or self-worth.

External violence takes many forms. These include:

- Bullying
- Gender-based violence such as
  - Sexualized violence: rape, harassment, control etc.
  - Intimate partner violence
  - Domestic violence
  - Human Trafficking (<https://canadianwomen.org>, 2021)
- Coercion
- Manipulation
- Child abuse
- Homicide
- Hate Crimes

In both internalized and externalized acts of violence, we see the culmination of the masculine norms as they intersect with many men's constricted abilities for healthy socialization. This

violence permeates our families, workplaces, and communities. These noxious fruits fall from the tree and continue to contaminate the soil by reinforcing and perpetuating the social messaging and violence of patriarchal masculinity.

Externalized Responses to Stress	Internalized Responses to Stress
<ul style="list-style-type: none"> <li>● physical or verbal aggression</li> <li>● bullying</li> <li>● intimate partner violence</li> <li>● sexual abuse or assault</li> <li>● chemical or behavioural addiction (aggressive behaviours, substances, alcohol, gaming, porn, etc)</li> <li>● defiance</li> <li>● other criminal acts (vandalism, theft, etc)</li> </ul>	<ul style="list-style-type: none"> <li>● anxiety</li> <li>● depression</li> <li>● chemical or behavioural addiction (as avoidance behaviours: substances, alcohol, gaming, porn, etc)</li> <li>● social restrictiveness</li> <li>● avoidance of help-seeking</li> <li>● shame and/or guilt</li> </ul>

## **8.0 Extent To Which Traditional Therapies (& Other Interventions) Are Successful at Engaging Men and Boys**

“Each person is an individual. Hence, psychotherapy should be formulated to meet the uniqueness of the individual’s needs, rather than tailoring the person to fit the Procrustean bed of a hypothetical theory of human behavior.”

Milton Erickson  
(*The Letters of Milton Erickson*, 2000)

In Greek mythology, Procrustus would place people into a bed of his own making, either stretching their bodies or cutting off limbs to forcibly make them fit. The late psychologist and psychiatrist Milton Erickson invited therapy professionals to consider that our clients may inadvertently feel stretched or otherwise forced into therapeutic systems that feel unnatural.

Almost two decades of research on masculinity and mental health points to this same notion: that traditional practices in therapy are inadvertently causing harm to some men and boys (Mahalik et al., 2012; American Psychological Association, 2018).

In this section we look at how therapy is traditionally delivered, and why some men would be better served by a different approach.

### **What Does Traditional Therapy Look Like?**

Therapy is a concept that was created by men (notably Sigmund Freud and his contemporaries) for women. As a result, the therapeutic process was largely based on male assumptions about the psychological development of women (Englar-Carlson and Stevens, 2006). Prominent feminist

therapists and theorists have pointed out the discrepancy between the origins of therapy and the therapeutic needs of men, but the core elements of individual and group psychotherapy nevertheless remain largely unchanged.

Therapy, as currently constituted, generally displays the following elements:

- Takes place within a closed, office-based physical space
- Is physically sedentary, with the patient/client typically seated on a chair or couch
- Uses a talk-focused method of communicating
- Endorses a “forced intimacy”: facing a relative stranger, maintaining eye contact
- Is centered on exploration of emotions, requiring high emotional literacy
- Has expectations of self-disclosure, especially of one’s deep vulnerabilities

This remains the dominant model, despite the emergence of new therapeutic models over the last few decades. It is found in private practice clinics, community mental health programs, hospital or institution-based mental health services, and is the model still largely used in the following contexts:

- Youth Correctional or Detention Facilities
- Addictions Treatment Institutions and Programs
- Youth or Adult Group Homes (including Assisted Living, and Places of Safety)
- Community Services (Child Protective Services, Children in Care, etc)
- Intimate Partner Violence (IPV) Intervention Programs

- School Counselling
- Restorative Justice
- Alcoholics Anonymous, Narcotics Anonymous and related 12-Step Programs
- Mandated Impaired Driving Rehabilitation

The most notable change to the way therapy is delivered has come in large part due to the COVID-19 pandemic: the massive growth in online or telephone therapy. While this approach offers numerous benefits, the therapy framework remains fairly consistent, even in the virtual world. It involves sitting in a confined space, not moving one's body, staring at another person through a screen, using spoken language, and exploring one's emotional landscape, including our deepest traumas.

We have discussed some of the reasons men and boys exhibit poor help-seeking behaviours. A growing body of research suggests that one factor may be rejection of the type of services available. Consciously or subconsciously, men and boys avoid asking for therapeutic support due in part to the "limited masculine competence" found in most therapists and therapy services (Bedi et al, 2016).

We are not suggesting that in-person or virtual therapy is ineffective for men. Many male-identified clients (of varying cultures, age, sexual orientations, and religious beliefs) benefit from this practice of therapy. But this does not mean it is the only possible approach.

### **Gender Identity Of Therapists**

Complicating the data on men's help-seeking patterns is the fact that most therapists identify as female. The Canadian Psychological Association reports almost 75% of therapy clinicians (psychologists, social workers, counselling therapists and psychotherapists) identify as female. Additionally, the majority of clinical therapist training programs are instructed by women, which likely furthers the notion of "limited masculine competence" in many clinicians (Bedi et al, 2016). Stated quite simply, the lived experiences of someone influenced by traditional masculine norms, and the consequences that arise from this background, are best understood by one who has lived with those experiences. By extension, one could argue male clinicians possess a greater capacity to both understand, and ideally, support their male-identified clients.

The research examining clinician/client gender versus the effectiveness of therapy remains somewhat thin and inconsistent. However, what is clear is that seeing a female therapist is an additional barrier for some male-identified clients. Lambert (2016) found that male clients were more likely to continue with therapy if seen by a male therapist. Conversely, limited data has also identified that some male clients feel slightly more comfortable speaking with female therapists (Rabinowitz and Cochran, 2002).

Our point is not that clinical services provided by female practitioners are ineffective, but that the lack of male clinicians may have an impact on the low use of mental health services by men. This is an area that requires further study.

### **Men's Attrition Rates And Engagement In Therapy**

We have already seen that only 34% of clients identify as male (Bedi, 2015), despite the overwhelming physical and psychological health data pointing to the need for men to seek support.

Even more concerning, a 2021 Australian study shows that men have disturbingly high attrition rates in mental health settings. According to the study (Seidler et al, 2021), almost half of men (44%) who enter therapy dropped out prematurely. Similarly, over 25% failed to return to a clinician after only a single session.

As a result, the "...premature, unilateral termination of psychotherapy often results in negative consequences for clients, such as poorer mental health outcomes and discouragement from seeking future treatment elsewhere" (Hamilton et al, 2011). The ripple effects of attrition rates and worsening mental health outcomes further impact men's intimate partners, family and children, social and community relationships, and even strangers.

### **Clash of Cultures: Traditional Masculinity vs. Traditional Therapy**

As we know from Learning Styles Theory, individuals do not all assimilate information the same way. Similarly, in individual or group therapy settings, clients do not all connect relationally, access inner states, or internalize information in identical ways. Gender is a factor as well, and

the vast array of therapy settings require greater gender sensitivity if they are to help positively influence masculine ways of being.

Wade and Good (2010) refer to a “lack of fit” between two cultural norms: the culture of masculinity vs. the culture of therapy. We know that the culture of masculinity conditions men into holding back deep vulnerabilities, avoiding sharing emotions, minimizing intimate contact with others, solving problems alone, and so on. While these and many other aspects of traditional masculine norms may be categorized as unhealthy, there are other aspects of the male socialization process that should not be categorized as either healthy or unhealthy on their own. These include (but are not limited to): being goal-oriented, solving problems, a tendency for risk-taking, preferring concrete over abstract, a preference for action-oriented, etc. (Englar-Carlson and Stevens, 2006).

Standing in contrast however, is the culture of traditional therapeutic services as described above, which is sedentary, time-bound, focusing on emotional exploration, etc. (Addis and Mahalik, 2003).

This contrast between traditional masculine norms and traditional therapy approaches highlights a stark reality in the therapeutic community:

- men and boys are in great need of therapeutic services
- most therapy services available tend not to align with how many of these men and boys connect, engage with, and access their rich and painful inner states

Most current research highlights even more specific aspects of this culture clash, (Weidler, 2016; Springer and Bedi, 2021), which we explore in more detail in the following chapter:

- Lack of connection, or limitations in the therapeutic alliance men feel with their therapist
- Lack of focus on building trust
- Struggles with the therapy modality or therapeutic approach

### **Effectiveness of Common Therapeutic Modalities**

Another vital aspect of the therapy process is the modality, or methodology of therapy techniques used by a clinician. These come into play in various elements of the therapy process, such as the flow of a session or sessions, type of conversations held (sometimes including specific words used), tools or strategies offered, specific content to explore, and homework. Common therapy modalities include Cognitive Behavioural Therapy, Dialectical Behaviour Therapy, Acceptance and Commitment Therapy, Narrative Therapy, Motivational Interviewing, and Mindfulness.

Of course, many male clients find these methodologies helpful, but they may not be addressing the particular gender-sensitive needs of many men. By failing to recognize this, clinicians are inadvertently turning clients away from therapy before they begin, by enforcing the cultural norms of therapy, thereby contributing to men's poor help-seeking behaviour when it comes to mental health.

Research over the last decade supports this hypothesis, yet clinicians and institutions have been slow to adapt. Interviewing men who dropped out of therapy in both the US and Canada, Springer and Bedi (2021) found that the most common reasons for leaving therapy were:

- “Not the right approach ” and
- “Not the right interpersonal fit”

When participants were asked what characteristics of therapy may have kept them engaged, “Change the approach” was the most frequent response. These findings are consistent with a growing body of publications from experts and researchers in the field of mental health and masculinity (Brooks, 2010; Englar-Carlson et al., 2014; Rochlen & Rabinowitz, 2014, Seidler, 2021, Drew et al, 2021), showing that men’s reluctance to attend or commit to treatment is in large part due to the lack of tailored, gender-sensitive methodologies used by most clinicians (Seidler et al, 2018).

If therapists, institutions and policy-makers hope to shift the tide of poor help-seeking behaviours among men, and to improve low mental health outcomes and promote greater engagement in the therapeutic process, therapy approaches and settings need greater resonance with men and boys.

## **9.0 Gender-Sensitive Therapies and Interventions for Men Aimed at Building Healthier Expressions of Masculinity**

What is gender-sensitive therapy for men? In this section we present a summary of various characteristics of therapeutic settings that fit the term. Specifically, we are addressing mental health (and allied) clinicians seeking to provide a more masculine-informed therapeutic approach, in both theoretical grounding and practice. When we adopt these approaches, we open our practices up to fit the client — male-identified or otherwise — who shows up in our office, and we do not force them into a framework that is generic, uncomfortable, and unyielding (Englar-Carlson and Stevens, 2006).

Research has shown that for men who adhere to traditional masculine norms, creating male-friendly spaces that are safe for men to explore their vulnerabilities and that promote a greater sense of alliance with the clinician can produce the following positive results:

- Improved help-seeking behaviours
- Lower attrition rates
- A reduction in the vast array of negative impacts (mental, physical, social, etc.)
- A gradual shift in men's adherence to traditional masculine norms

(Springer and Bedi, 2021; Drew et al, 2021; Seidler et al, 2016; Schienfeld et al, 2011)

Adjusting the support systems through which men and boys can manage their distress may also shift unhealthy expressions of manhood.

### **Characteristics of Gender-Sensitive Treatment for Men**

These are some of the elements of gender-sensitive treatment for men (American Psychological Association, 2018; Schienfeld et al, 2011; Seidler et al, 2016; Drew et al, 2021).

#### **Focus on Therapeutic Alliance**

- Men's high attrition rate is frequently driven by a lack of connection with the clinician. Helping professionals should emphasize facilitating a meaningful, authentic connection with male-identified clients.
- Modelling prosocial masculine behaviours, and when appropriate, using self-disclosure to demonstrate empathy can deepen therapeutic alliance.

#### **Challenge Traditional Concepts of Masculinity and Gender Norms**

- In order to help shift the prevalence of unhealthy masculine norms, we must first support our clients to increase awareness. This creates space to find compassionate and meaningful ways to explore those norms, and the impact they are having on the lives of men and boys.

#### **Expand the Idea of Where and How Therapy Happens**

- Many men struggle with the idea of office-based therapy.
- Therapy can take place anywhere, including while performing a variety of activities. Providing a therapy experience while moving — hiking, walking, or riding a bike for

instance — is helpful for many men. In this case, the place or activity supports the therapy. Engaging in activities one enjoys or exploring new places can be inherently therapeutic. Combined with a trained clinician, this can produce powerful results.

- A wide variety of activities can be incorporated into the therapy. For example, sitting by a campfire (mindfulness), indoor rock-climbing (problem-solving), canoeing (relationships), and hiking (coping with obstacles).

#### **Building Community/Social Connections**

- Men struggle with building and maintaining lasting relationships.
- In a group therapy setting, building safe and vulnerable spaces with other participants provides an opportunity for men to open up, feel a sense of belonging, and to hear comparable stories.
- In individual therapy, clinicians can model the importance of relationship-building with other men, and encourage men to grow and develop meaningful social networks.

#### **Indirect Strategies to Explore Vulnerabilities and Emotional Literacy**

- Men are conditioned to suppress and deny emotions.
- Men tend to respond positively to non-clinical (non-traditional) approaches and thereby experience the depth and breadth of human emotions. Men have rich, deep inner lives, so we should invite men to experience them and build their capacity for emotional literacy.
- Some strategies that can be successful: use of stories and metaphor, somatic practices, creative or other expressive modalities.

### **Multiple Therapeutic Modalities**

- Men report that rigid, one-size-fits-all therapy discourages them from fully engaging in the therapeutic process.
- Using flexible, adaptable approaches based on lived experience of clients supports men as individuals.
- Using a variety of tools, strategies and approaches to facilitating insight, exploring emotions and solving problems increases the likelihood of connecting, so that men feel seen and heard.

## **10.0 Conclusion**

At the request of the Mass Casualty Commission, this report has been compiled to present research findings and literature that makes clear the connection between traditional, patriarchal norms of masculinity and male violence. What we are seeing and experiencing in communities in North America, reinforced by the literature, is a daily litany of masculine inflicted violence.

What is also apparent in the literature and in our direct work with men from a mental health perspective, is that these same traditional norms of masculinity which promote and condone externalized violence perpetrated on others, also lead to poor health outcomes in boys and men, emotionally, psychologically and physically. These poor health outcomes combined with poor help seeking behaviours in boys and men, lead to internalized violence of undiagnosed mental illness, self harm, and high rates of suicide. The effects of both the internalized and externalized violence are far reaching with traumatic results impacting boys, men, their partners, families, and our communities at large. The frequency of these acts of violence by men also perpetuates and habituates male violence in North American culture.

What is also apparent in the literature and from direct experience, is that traditional forms of therapeutic support are not adequate on their own to help boys and men cope with the tremendous weight of masculine norms. Other kinds of gender sensitive and responsive treatments are necessary to engage and support men's health. As men and male-youth are responsible for the vast majority of violently-defined acts, then where are the policies, programs,

and services of our social, educational and political institutions to address this masculine violence? In addition, if we could create a wide reaching cultural shift that ushers in healthy masculine norms and ways of being, then we increase the potential for boys and men to live more fully human versions of themselves.

## LITERATURE REVIEW

### **Conceptions Of Masculinity And Violence: Towards A Healthier Evolution For Men And Boys**

#### **Introduction**

The intention of this report is to examine various concepts of masculinity, including traditional masculine norms, the mental health and wellbeing of men, and the relationship between masculinity and violence. In doing so, this literature review highlights the key academic and print content, seeks to establish the credentials of primary contributors to the field, while also presenting cornerstone concepts found in the larger report, while also highlighting any gaps in the literature.

It is paramount to identify at the outset a likely bias that exists embedded within the nature of the scholarly content referred to in these pages. Given the ubiquity of masculine norms in the fabric of our culture, it is reasonable to believe that authors, academics and researchers on the topic of masculinity unintentionally carry such biases or gaps into their work. This would include the writers of this report. While there is little in the way of literature to support this assumption, it is a bias that is not altogether unfathomable. As such, it is equally conceivable that gaps in the understanding of this topic exist as a function of this bias.

#### **Defining Masculinity and Masculine Norms**

According to Micheal Kimmel (2017), the concept of masculinity is not solely related to being biologically male. Instead, it is vital to underscore that masculinity is a social construct. That is to say, the concept of what it means to be masculine is an idea that was - and continues to be - created and accepted by social groups throughout history. These frameworks for manhood become an ideology that are perpetuated across generations (Englar-Carleson, 2006), and "...develops as growing boys internalize cultural norms and expectations about gender-appropriate behaviour." (Pleck, 1995).

While many sub-groupings of traditionally-defined masculinity exist globally, Raeywan Connell (1990) posits that the idealized expressions of masculine ideology are expressed in terms of power and dominance, where toughness, competitiveness and hyper-sexuality are preferred ways of being. Additional norms include the subordination of women, and the marginalization of males who fail to conform. As such, these forces fuel the continued expressions of what many refer to as 'toxic', or hegemonic masculinity (Englar-Carleson and Stevens, 2005; Rabinowitz, 2009; Newson, 2015, Wall and Kristjanson, 2005).

Writer bell hooks (2003) shines a light on the patriarchal drivers that concentrate power and privilege in hands of men, and more specifically, the colonial beliefs of white, cisgender men. Jackson Katz (2019) further highlights these ideas of power and privilege, and suggests that the benefits gained by men, also serve to perpetuate both the ignorance of their existence, and their harmful impacts on those around us.

Various contributors from the field of men's studies (Heilman and Barker, 2018; Katz, 2019; Kimmel, 2017; Sultana, 2012; and Becker, 1999) identify a strictness to which these norms are defined. Those viewed as stronger, more influential or of higher social status serve to uphold these patriarchal codes (Levant, 1996), lest they themselves become victims of judgment and marginalization. These standards must also be adhered to so as to remain robust across a population of boys and men. To ensure this is the case, norms of manhood are enforced by a form of social-policing - particularly by those judged to be 'more manly' (Englar-Carleson and Stevens, 2005).

Interestingly and ironically, masculinity is oftentimes identified more by being in opposition to characteristics deemed feminine. As such, this further entrenches the concept of a binary between masculine and feminine, in lieu of honouring multiple masculinities (Connell, 2001 and Levant, 2020).

### **Harmful Impacts of Traditional Masculine Norms**

In his 1977 book entitled "The Hazards of Being Male", Goldman refers to the "...lemming-like purpose..." by which men both adhere to, and are impacted by traditional masculine norms. These harmful impacts are ubiquitous in their reach, affecting the emotional, psychological and physical domains of wellbeing (Levant, various writing; Katz, 2019), leaching into the social, familial, political, educational and employment spheres of men and boys (Pleck, 1995, O'Neil et al, 1986).

In order to more closely make such links between traditional masculine norms and these impacts, Levant et al (1993) and Mahalik et al (2003) have contributed to the field by constructing measures of masculine norms, or male-norms inventories. While there exists subtle differences between each of the above measures, it is generally accepted that greater adherence in traditional masculine norms (as measured by any either of the above mentioned inventories), translates to worse physical and mental health outcomes (Seidler et al, 2016; Mahalik, 2003).

The patterns mentioned above are comparable on a global scale, and supported in various international reports, including World Health Organization's Report on Men's Health (2018),

and the American Psychological Association’s Guidelines for Psychological Practice with Boys and Men (2018).

### **Specific Harmful Impacts: Poor Help-Seeking Behaviours**

A deep pool of studies supports the generally held belief that adult men and male-identifying youth exhibit chronically poor help-seeking behaviours, specifically related to physical and mental health-related concerns (Bedi, 2005; Levant et al (1993); Mahalik et al, 2003; Scheinfeld, 2011; Terlizzi and Norris, 2021). Seidler (2016, 2020) has similarly supported this assertion, and furthered the field to additionally examine patterns of usage when men do engage in mental health services. Generally, if men and male youth do seek support - specifically - for mental health-related concerns, attrition rates are statistically higher than other gender expressions. These findings are similarly supported by [Addis & Mahalik \(2003\)](#), [Wall and Kristjanson \(2005\)](#); and [Wang et al. \(2007\)](#).

[While these patterns of help seeking behaviours persist amongst Western cultures, the bulk of research reflects the experiences of predominantly white, cisgender, heterosexual men. Similar international research in the area of men’s health and masculinity reinforces these norms of poor help-seeking patterns \(WHO, 2018\), and also highlights more variability in the data. As such, some researchers have identified a gap in the literature, suggesting that the impacts of race, culture, geography and ethnicity have not been fully explored in men’s health literature \(Parent et al, 2018\).](#)

### **Specific Harmful Impacts: Masculinity and Violence**

[Levant and Pryor \(2020\) stated with frightening simplicity, “Most acts of sexual assault and gun violence are perpetrated by men, yet most men are not violent.”](#)

[From an early age, male youth are pressured to restrict the range of emotional expressions, especially those that violate the code of toughness, stoicism, heterosexism and self-sufficiency \(American Psychological Association, 2018; Wall & Kristjanson, 2005\). In doing so, violence and aggression become acceptable tools used to meet those norms, as well as the only tools available to express emotion or distress \(Feder, Levant, & Dean, 2010; Pellegrini & Bartini, 2001\).](#)

Using Statistics Canada data collected over the last decade (2010-2021), the authors of this report compiled a list of statistics related to specific violent, or otherwise harmful acts (to self or others), as a function of gender. Men rated higher in all categories considered: whether rates of suicide, homicide, intimate partner violence, mass shootings, death by drug overdose,

incarcerations, addictions, etc. While these statistics are public knowledge, examples of men's violence can be observed on a daily basis by scrolling through the news headlines.

While the following reference is specific to concerns around violence perpetrated against women, the title of Jackson Katz's TEDx Talk (2016) speaks to the stats referenced above, stating that "Violence against women - it's a men's issue." This poignant noticing, the subject of a plethora of research and print resources available on the topic the world over, sheds light on perhaps the most compelling gap: that if men and male-youth are responsible for the vast majority of 'violently-defined' acts, then where are the policies, programs and services of our social, educational and political institutions to shift the tides of this harmful reality that has been with us for generations?

### **Men, Mental Health and Traditional Therapy**

[The American Psychological Association \(2018a\), in their Guidelines for Psychological Practice for Men and Boys, has collected and highlighted decades of literature, research and practice. Of the many standards of therapeutic practice for men and boys, there is a recognition for mental health clinicians to both educate and build a skillset at providing gender-specific therapy services. This is driven in large part by a 'culture clash' between traditional masculine expressions of self, versus the traditional nature of most therapeutic approaches and settings \(Springer and Bedi, 2021; Weidler, 2016; Wade and Good, 2010; Scheinfeld et al, 2011; Englar-Carlson and Stevens, 2006; Addis and Mahalik, 2003\).](#)

With a growing awareness of this disconnect in the literature over the last two decades (many of which are referenced in the paragraph above), discourse on what exactly '*gender-sensitive therapy*' entails is relatively small but viable. Enough data exists to support the widespread implementation of education and awareness programs in therapist training programs and publicly funded therapy settings - at the very least in the form of pilot programs. (Rochlen and Rabinowitz, 2014)

Unfortunately, there is relatively little in the way of programs or services (public or private) that translate any into gender sensitive therapeutic practices. Discouragingly, this is despite the overwhelming evidence that the status quo or traditional therapy is not only limited in effectiveness, but damaging as well. There is little in the way of supporting documentation that explains the reluctance of public health clinics or private practitioners to shift the nature of therapeutic practice to more appropriately support men and male-youth. Understanding more to support this evolution could be seen as a social imperative.

It should be noted that a relatively small number of organizations have both the mission and resources to raise awareness, invest in innovative programs, conduct research, and fund scaling efforts to better support men. Encouragingly, there is a groundswell of community-based programs that are exploring new and innovative methods of supporting the unique mental health needs of men and boys, some of which exist in Nova Scotia (Cardone, TEDx Halifax, 2019).

### **Conclusion**

Prominent researchers and writers have laid out a deep and wide foundation of critical literature on the subject of masculinity, how it is framed as a social construct, and how these notions are reinforced. While some expressions of traditional masculine norms might be experienced as helpful or productive, there is sufficient evidence to unequivocally state that many traditional masculine norms are indeed harmful. This report sheds light on the relationship between traditional norms of masculinity and violence. The various types of violent acts that emerge as a function of these masculine norms - both external acts, and internal - underscore the social imperative for political institutions, schools, and mental health settings to support a healthier evolution of men and male-identified youth.

## **EXECUTIVE SUMMARY**

### **CONCEPTIONS OF MASCULINITY AND VIOLENCE**

#### *Towards a Healthier Evolution for Men and Boys*

Overwhelmingly, men and boys are more frequently both victims and perpetrators of violence. From disproportionately high rates of suicide, addictions, victims of homicide and child sexual abuse; to perpetrators of domestic violence, sexual assault, child abuse and mass killings. While there is often a complexity of reasons underlying acts of violence such as lack of appropriate resources and service, generational and personal trauma, mental illness, access to firearms and other reasons, it is rare that we connect violent acts perpetrated by men to the traditional conceptions of masculinity: how boys and men are socialized in western society.

This said, there is an abundance of literature from well regarded researchers, writers and speakers who have placed a spotlight on this relationship between masculinity and violence as well as the damaging and tragic effects of traditional and patriarchal concepts of masculinity on men and boys, their partners and families, and communities as a whole.

### **Exploring Concepts of Traditional Masculinity**

To fully explore traditional concepts of masculinity, we need to recognize that there are larger systems and forces which are foundational to maintaining and promoting these concepts and norms in society. Traditional concepts of masculinity in Canada and North America have been greatly influenced by the following systems of oppression:

- **Patriarchy:** Which insists males are dominant over others in society and can use violence as a tool to enforce their domination (hooks, 2004). Other terms for these more rigid forms of masculinity include hegemonic masculinity, hyper-masculinity, toxic masculinity, dominant masculinity and/or misogynistic masculinity.
- **Imperialism and Colonialism:** Imperialism refers to the policies and ideas which lead to one country's expansion and domination over other countries. Colonialism refers to the practices of settling and exploiting people and resources of other countries. These two systems of oppression give domination to the white European body, particularly the white-male body, while all other bodies are considered inferior and 'not human', (Menakem, 2017). In order to exert this domination the use of violence is acceptable.

#### **Multiple Masculinities and Compassionate Masculinities:**

Gender is a complex array. Even within the idea of masculinity, there are multiple masculinities that can be present. While the binary of one feminine and one masculinity is quickly becoming

outdated, it continues to play a dominating role in how we organize our society and socialize children.

If masculinity is viewed as a panorama with multiple expressions, we can also see and experience men who demonstrate forms of masculinity that may be deemed as non-traditional, pro-feminist, liberal, progressive, and compassionate. These men actively challenge or disassociate from the harmful stereotypes of patriarchal masculinity in their family, workplaces and communities. Simultaneously these non-traditional men are still subject to the forces of traditional masculinity in ways they may not know.

#### **Defining Norms of Traditional Masculinity**

Two notable researchers, Robert F. Levant who researched a man's belief in the existence of these norms, and James R. Mahalik, who researched men's adherence to these norms, provided a list of defining characteristics or norms for traditional masculinity. The essence of their work can be summarized in the following list. The statements in parentheses are more colloquial phrases which capitulate the defining characteristics:

- Avoidance of all things feminine and power over women (Don't be a pussy; man up)
- Restrict and control emotions (Don't cry; suck it up; be a man)
- Self reliance (Fix it yourself; get it done; don't ask for help)
- Toughness and violence (Be a man; be ripped; no pain no gain, violence solves problems)
- Dominance (Be aggressive; take control; don't back down)
- Importance of physical sex (Stud; player; get as much as you can, whenever you want)

- Distain for sexual minority men (Don't be gay or a "f\*g"; calling objects or activities 'gay' because they are not desirable)
- Winner (Jock; win at all costs)
- Risk taking: (Drink a lot, drive fast, high-risk/adventure activities)
- Pursuit of work, status and power (Career; money; provider; breadwinner; drive a nice car)

For many men, trying to live up to these unattainable norms leads to poor mental and physical health outcomes. These poor health outcomes can be experienced as 'internalized violence' or 'externalized violence'.

For boys and men from racialized experiences, there is a perceived need to not only live up to the unattainable traditional norms of masculinity, but also to live up to the unattainable norms of white dominated society. These pressures have a tremendous impact on the mental, physical and social health of racialized men.

Similarly rural communities tend to have more traditional mindsets, less alternative examples of masculinity and less resources to support gender sensitive treatments or programming. They also tend to have a more rigid reinforcement and policing of traditional gender roles.

### **Why Do Men Adhere to Traditional Masculine Norms**

There are numerous individual reasons why men might adhere to these norms, which can be distilled to the following: (hooks, 2017, Katz 2012)

- Lack of awareness of masculine norms and opportunities to investigate and challenge these norms
- Policing of masculine norms by other men, women and society at large
- The physical and psychological risk to those who deviate from the norms, and
- Adherence allows men to maintain positions of power and privilege

Some of the influencers which perpetuate traditional masculine norms include:

- Close relationships: Peers, family, educators, sports coaches, mentors and social groups
- Media: video games, social media, pornography, films, books, advertising, TV, streaming services
- Competitive team sports culture
- University fraternity and dormitory culture
- Rise in organized white supremacist groups including NeoNazi groups, and
- Rise in online Incel (Involuntary Celebate) groups

### **Harmful Impacts of Traditional Masculinity**

While it is clear that conforming to the traditional concepts of masculinity provide men with power and privilege in this society, what is less apparent is that the conformity comes with a heavy emotional, psychological and physical cost to men and boys, which ripples out to their key relationships and communities.

Two main theories encapsulate the internal and external harm caused by the male socialization process on one's individuality and authenticity (Scheinfeld, 2014):

**Gender Role Strain** theory posits that men experience mental and emotional strain or distress when they cannot meet the expectations of traditional masculine norms, while simultaneously addressing their authentic emotional and interpersonal needs. For example, the need to rely on another for emotional support stands in contrast to the male norms of emotional control and self-reliance.

**Gender Role Conflict** suggests that adherence to masculine norms leads to thoughts, feelings, behaviours and values that create inner conflict because they contradict familial and societal norms. For example, the masculine norm emphasizing sexual prowess and to be the playboy, may stand in contrast one's family or social values of respecting self and others.

The internal and external impacts of these realities for many men and boys, from a mental and physical health perspective, are staggering. According to Statistics Canada (various reports, 2010-2021), and compared to women, men and boys face disproportionate rates of the following harmful outcomes:

- 75-80% of suicide deaths

- 77% of homicide deaths
- 86% of perpetrators of homicide
- 94% and 83% of incarcerations (federal and provincial)
- 100% mass/school shootings
- 2 times more likely to struggle with addictions
- 77% of overdose deaths
- 80% perpetrators of intimate partner violence
- 2 times more likely die in automobile accidents
- 65% of those who experience homelessness

The World Health Organization reports the underlying causes for poor health outcomes for men and boys is due to the following contributing factors (WHO, 2018):

- Increased high risk behaviours in men (alcohol, drugs, interpersonal violence, etc),
- Poor health maintenance in men (diet, exercise, stress management, etc), and
- Lower utilization rates of health services by men.

The above list can be summarized as an adherence to traditional masculine gender norms.

### **Impact of Traditional Masculine Norms on Help Seeking Behaviours**

While it is not practical to survey men who do not show up or reach out for services, the only statistics available are related to men who do seek medical and psychological help:

- 34% of all those who actually seek psychological support from a therapist identify as male (Bedi, 2015);
- 60% of men do not consult a physician for regular physical care, only accessing the medical system when conditions deteriorate (Terlizzi and Norris, 2021);
- Women are 33% more likely to seek medical support than men. (Brett and Bert, 2001)

When considering accessing mental or physical health services, men are often faced with what some refer to as a *Double-Bind*. A double-bind is a dilemma that results from a conflict between two or more messages. For example, while a man might feel internally that mental health support services could be helpful, reaching out is stigmatized and to ask for help stands in contrast with the messaging of male gender norms. Caught in a loop between these two conflicting messages, a man may feel psychically stuck for what to do, leading to a worsening of one's health, and further fueling the loop. (Rochlen and Rabinowitz, 2014)

### **Post-Traumatic Stress Disorder (PTSD) and Hyper-Masculine Environments**

It is often hard to determine the prevalence of PTSD in men, given the influence of traditional masculine norms on poor help-seeking behaviours, and so many men go undiagnosed with PTSD, particularly in military and first responder sub-cultures, often referred to as hyper-

masculine work environments. Here, we see greater expressions of masculine norms such as emotional control and self-reliance, where fewer men in these environments tend to seek support for the traumas directly associated with their work, the lingering effects of adverse childhood events, or the daily stressors we all experience.

### **Racial Trauma**

Race-based Traumatic Stress refers to the mental and emotional injury caused by experiencing racial bias, ethnic discrimination, racism and hate crimes. While a full exploration of race-based traumatic stress and its impact on men and boys is beyond the scope of this report, what we can offer is that colonialism, imperialism and white supremacist culture have immeasurable impacts on the BIPOC bodies, particularly boys and men. We see these effects as a result of the following historical and current traumas: loss of land, lack of governance, marginalization, incarceration rates, residential schools abuse and violence perpetrated on Canada's Indigenous people. We see race-based trauma in the high rates of physical and emotional ailments that impact Indigenous and Black bodies. And we see this in how Newcomers refugee boys and men arrive with trauma from witnessing war and violence and then need to quickly understand and assimilate into a Canadian culture with values and beliefs that may conflict with the values and beliefs from their country of origin.

### **Traditional Masculine Norms in Condoning and Promoting Violence**

A number of the masculine norms stated earlier directly implicate violence as a norm of behaviour: *Violence, toughness, dominance, power over women, disdain for sexual minority men, pursuit of status*, all imply that men are required to demonstrate their toughness and physical or

emotional strength, with an emphasis on violent action if required. Deviation from these norms implicates men as feminine, gay, weak, and in perspective of traditional masculine norms as *not men*. Those men who deviate from these norms, along with women and 2SLGBTQAI+ are at risk of violence from those who adhere to traditional masculine norms.

The various media sources referenced previously in this document not only perpetuate traditional masculine norms, they frequently condone, promote and elevate the role of violence in a man's life to fix problems.

This is not to say that boys and men want to mimic what they see in these media sources, rather that the repeated images reinforce the messages of hegemonic masculine norms and desensitize young males (Katz, 2021). The repeated message is: violence is manly and if you're not violent you're not a man. While women are repeatedly portrayed as objects to satisfy sexual and violent desires, thereby normalizing misogyny.

Adherence to the set of norms which tell men to suppress emotions and not ask for help, directly and indirectly promote and condone violence. This cocktail of persistent violent messaging, and acceptable manly emotions (anger, rage and aggression), combined with the suppression of most other emotions (including empathy and sympathy), often leads to internalized and externalized violence in devastating proportions.

**Internalized Violence:**

When men have few options available to deal with their own emotional or psychological distress they too frequently internalize their suffering. We see this in the form of addictive behaviours such as substance use, video games, pornography and workaholism as ways to mask, minimize or self-medicate their suffering and isolation. These behaviours are harmful to the individual and

they also ripple out to loved ones who witness these self destructive behaviours. The most tragic outcome of men's attempts to fix their own suffering is suicide. In male sub-groups (Indigenous, gay, transgender, military, men going through divorce etc.) suicide rates increase, (Ogrodniczuk et al, 2020)

**Externalized Violence:**

In many cases, men's externalized violence against others is a means, not an end (Katz 2021), and can often be seen as a way to satisfy an unmet need, to fill an emptiness within. For instance, violence enacted on those 'deemed weak' may be a way to temporarily bolster confidence or self worth. This lack of confidence and self worth is a result of an inability to meet unrealistic masculine norms and expectations. The externalized violence takes many forms from physical violence like rape and other forms of gender-based violence, homicide, child abuse to emotional and psychological violence such as bullying, coercion, manipulation, hate crimes etc.

In these descriptions of internalized and externalized violence, we see the results of traditional masculine norms acting out in men's lives. These acts of male violence go on to permeate our families, workplaces and communities.

**The Extent to Which Traditional Therapies are Successful at Engaging Men and Boys**

Traditional Therapy is a concept that was created by men for women. As a result, the therapeutic process was largely based on male assumptions about the psychological development of women (Englar-Carson and Stevens, 2006). Despite prominent feminist therapists and theorists

pointing out the discrepancy between the origins of therapy and the differing therapeutic needs of men, the core elements of individual and group psychotherapy remain largely unchanged. The characteristics of traditional therapy include:

- It takes place within a closed, office-based physical space
- Is physically sedentary, typically seated in a chair or couch
- Utilizes a talk-focused method of communicating
- Endorses a ‘forced intimacy’- facing a relative stranger, maintaining eye contact
- Centered on exploration of emotions, requiring high emotional literacy
- Expectations of self-disclosure, especially of one’s deep vulnerabilities
- Time-bound within a typical ‘50-minute hour’

Similar can be said of the online therapeutic framework, which looks fairly consistent: sitting in a confined space, not moving one’s body, staring at another person through a screen, using spoken language, exploring one’s emotional landscape, including our deepest traumas.

Boys and men avoid asking for therapeutic support due in part to the ‘limited masculine competence’ (Bedi et al, 2016) found in most therapists and therapy services. Gender identity of therapists and their ability to empathize with the masculine experience may also play a role in men and boys' attachment to a typical therapy experience.

A recent Australian study shows that almost half of the men, 44%, who enter therapy, drop out prematurely (Seidler et al, 2021). Similarly over 25% failed to return to a clinician after only a

single session. The “premature, unilateral termination of psychotherapy often results in negative consequences for clients, such as poorer mental health outcomes and discouragement from seeking future treatment elsewhere” (Hamilton et al, 2011.)

### **Why Men Disengage In Therapy Services**

The culture of poor help-seeking behaviours amongst men is one of the more relevant rationales for men’s:

- low usage of mental health services
- high attrition rates
- lower commitment to therapy services (if they engage at all).

This can be referred to as a clash of cultures between traditional therapy and traditional masculine norms.

Due to this clash of cultures, the most common reasons for men avoiding or leaving therapy are (Springer and Bedi, 2021):

- Not the right approach
- Not the right interpersonal fit with the therapist/clinician.

### **Gender Sensitive Therapies and Interventions Aimed at Building Healthier Expressions of Masculinity**

#### **Characteristics of Gender Sensitive Treatment for Men**

According to the American Psychological Association (2018), and other prominent researchers in the field (Schienfeld et al, 2011; Seidler et al, 2016; Drew et al, 2021), for men who adhere to traditional masculine norms, it is critical to create male-friendly spaces that are safer for men to explore their vulnerabilities. Some of these characteristics include:

- Focus on Therapeutic Alliance: authentic connection with male-identified clients
- Challenge Traditional Concepts of Masculinity and Gender Norms
- Expand the Idea of Where and How Therapy Happens
- Building Community/Social Connections
- Indirect Strategies to Explore Vulnerabilities and Emotional Literacy
- Multiple Therapeutic Modalities

### **Conclusion**

This report has been compiled to present research findings and literature that makes clear the connection between traditional, patriarchal norms of masculinity and male violence. What we are seeing and experiencing all too frequently in communities in North America, reinforced by the literature, is a daily litany of masculine inflicted violence.

What is also apparent in the literature and in our direct work with men from a mental health perspective, is that these same traditional norms of masculinity which promote and condone externalized violence perpetrated on others, lead to poor health outcomes in boys and men, emotionally, psychologically and physically. These poor health outcomes combined with poor

helps seeking behaviours in boys and men, lead to internalized violence of self harm and high rates of suicide. The effects of both the internalized and externalized violence are far reaching with traumatic results impacting boys, men, their partners, victims and families, and our communities at large. The frequency of these acts of violence by men also perpetuates and condones male violence

What is also apparent in the literature and in our direct professional experience, is that traditional forms of therapeutic support fail to meet the unique mental health needs to support boys and men cope in healthy ways with the tremendous weight masculine norms puts on them. Other kinds of gender sensitive and responsive treatments are necessary to engage and support men's health.

What is also needed is a wide reaching cultural shift that ushers in healthy masculine norms and ways of being that increase the potential for boys and men to live into more fully human versions of themselves.

## **I. Introduction**

The Mass Casualty Commission commissioned this report on the relationship between mass shootings and masculinity. In what follows, we first address the lack of a scholarly consensus surrounding how best to measure incidents that qualify as “mass shootings” in order to distinguish them from other shooting-related incidents. This lack of shared definition of the phenomenon inhibits direct comparisons between different research projects and constrains the ability to make broad claims.

Despite this, there exists a scholarly consensus that mass shootings are more common in the United States than any other nation, and by a large margin (Bridges and Tober 2016; Bridges and Tober 2019; Lankford 2015; Lankford 2016; Lemieux 2014). As such, we document what has been learned about mass shootings in the United States as a way of offering perspective, data, and analysis from a society that regularly experiences more mass shooting incidents than other nations around the world (which is true regardless of how “mass shooting” incidents are measured). Considering the fact that Canada and the United States have some cultural and legal similarities, many of the insights drawn from empirical research in the United States are worthy of consideration in the context of a Canadian mass shooting. Evidence from the United States also shows that mass shootings and related incidents have been happening with greater frequency since 2000 (Follman 2014; Lankford 2016; Bridges and Tober 2019). While these data do not exist internationally, there is cause to suggest that shift in the frequency of mass shootings in the United States is not internationally isolated, though the trend is extremely exaggerated in the United States.

Following, we provide evidence from our own research on mass shootings in the United States, a project that relies on the least conservative definition of “mass shootings” in existing

scholarship. We use this broad definition because it allows us to summarize results from a much larger pool of incidents, enabling us to identify patterns not possible to identify within the smaller samples that characterize the vast majority of scholarship on the topic.

An important and interdisciplinary body of scholarship on this topic attests to the importance of distinguishing data on measures like gun ownership from a much more expansive analysis of the meaning of guns within society—something scholars of guns and gun violence refer to as “gun culture.” And following our summary of definitional dilemmas surrounding scholarship on mass shootings and what we have learned about their prevalence and frequency in spite of these issues, we summarize the value of scholarship on gun culture for understanding mass shootings and related gun violence in societies. As evidence of the importance of gun culture, we present some initial findings from our analysis of mass shootings in the United States between 2013 and 2020 comparing mass shootings across states, findings that suggest different gun cultures in different states across the United States.

Finally, a great deal of scholarship has commented on the relationship between gender and mass shootings because such shootings are almost universally committed by men (again, regardless of how such shootings are measured and defined). Different scholars have accounted for this gender discrepancy in different ways, but we present our two-part theory that helps to make sense of two separate questions: (1) Why are mass shootings so overwhelmingly likely to be committed by men? And (2) Why do men commit mass shootings in the United States so much more commonly than men in other parts of the world? We summarize two separate bodies of research that help provide social–scientific answers to these two questions.

## **II. A Problem of Definition: How Best to Study “Mass Shooting” Incidents**

Despite the fact that there is widespread agreement that mass shootings are a serious social issue, there is less scholarly agreement than might be expected about the frequency of such incidents. This is true for a variety of different reasons. In this section, we summarize both the lack of scholarly consensus and why better, more representative data do not exist, as well as address some of what is known about mass shootings around the world despite these facts.

It is worth pausing to consider why these data do not exist in the ways they should. We currently live in a data-saturated era. Data are being extracted from us all the time, and data are collected on all manner of social life. Various government agencies, health organizations, and media outlets have, for instance, kept a running record of the COVID-19 infections and deaths all around the world—in real time and on a global scale. Most economically advanced nations have great data on the numbers of people who die each year from the flu, heart disease, car accidents, or any number of ailments. But we do not know how many people are killed by mass shootings each year. It is a knowable figure; the data are simply not collected in any official capacity. Part of the issue in some countries is with data collection, but even with broad support for data collection efforts, clear criteria need to be agreed on so that incidents can be assessed in an objective way to assess whether they meet the criteria or not. And this type of agreement has not been achieved within the scholarly community studying mass shooting incidents.

There are a variety of reasons that data that should exist do not exist, and some of these reasons pertain to data on mass shootings. Sometimes, there is simply a mismatch between incentives and resources. Those with the resources lack sufficient incentive (politically or otherwise) to collect the data, while those with the most incentive sometimes lack the necessary resources. This is absolutely the case with data on mass shootings (and guns and gun violence

more generally) in the United States (Metzl, et al. 2021). Additionally, some data do not exist because there are specific groups and entities invested in the data not existing. This too shapes what is known about mass shootings and gun violence more broadly in the United States.<sup>1</sup> Any nation invested in better understanding mass shootings within their borders needs to reckon with both whether and how these factors shape data collection on this pressing social issue.

### 1. Defining Mass Shootings

The problem of defining mass shootings is partially due to the fact that the category of incidents was not one initially created in any official capacity. In the United States, scholars studying mass shootings often rely on a definition of incidents initially proposed by the Federal Bureau of Investigation (FBI) (see Bridges, Tober, and Wheeler 2015). A large body of US scholarship utilizes the FBI definition of “mass killings” to study mass shootings. As is visible in **Table 1**, mass killings are distinguished by the FBI from other forms of homicide primarily by number of fatalities and the number of locations. The FBI defines mass killings as incidents in which a single perpetrator kills at least four people in a single location (but this classification is not limited to firearm-related incidents). Mass killings are included among incidents in the FBI Supplementary Homicide Report, which is a subset of the Uniform Crime Reporting program established in 1929.<sup>2</sup> Because incidents involving more than a single location (i.e., “spree killings”) are distinguished by the FBI definition from “mass killings,” those multi-location

---

<sup>1</sup> In the United States, the National Rifle Association (NRA) is a powerful enough political lobby that they have been able to effectively block research on gun violence (Spitzer 2020).

<sup>2</sup> The Uniform Crime Reporting (UCR) program was created to produce a space for national crime statistics. Indeed, a great deal of criminological research makes use of these data. However, the UCR program is not a national census of criminal activity in the United States because reporting crime incidents, rates, and statistics to the UCR is not mandatory. Since 1929, the UCR program has relied upon individual police agencies to voluntarily submit data. Some states elect not to report to the UCR, and even in states that do submit reports, there are agencies that elect not to report to the state. Thus, as with so much data on gun violence, as a result of this data collection process, the data from the FBI Supplementary Homicide Report is incomplete.

## Mass Shootings and Masculinity

incidents have traditionally been left out of scholarship on mass shootings. Scholarship that has made use of these data has also had to make decisions about which incidents to include, and the most widely used approach has excluded gang violence as well as family and intimate partner violence.<sup>3</sup> As a result of this definition, scholarship on mass shootings routinely does not include incidents connected with intimate partner and other forms of family violence or gang violence (e.g., Lankford 2016), and spree killings are also commonly excluded.

*Table 1: US Federal Bureau of Investigation Classification of Homicides*

Characteristic	Single	Double	Triple	Mass	Spree	Serial
Number of Victims	1	2 (not including perpetrator)	3 (not including perpetrator)	4+ (not including perpetrator)	2+ (not including perpetrator)	3+ (not including perpetrator)
Number of Events	1	1	1	1	1	3+
Number of Locations	1	1	1	1	2+	3+
Cool-off Period	N/A	N/A	N/A	N/A	No	Yes

Mass shootings scholarship has traditionally utilized this definition to produce datasets that identify incidents with a single shooter in a single location, with four or more fatalities (not including the shooter), and that are not considered family, intimate partner, or gang violence (e.g., Lemieux 2014; Lankford 2016). Some research excludes all incidents involving more than a single shooter, while others include incidents with multiple shooters. In fact, a study comparing

<sup>3</sup> A common source for this decision is a report released every few years produced by the New York City Police Department, “Active Shooter: Recommendations and Analysis for Risk Mitigation” (for the most recent version, see O’Neill, Miller, and Waters 2016). That report only defines incidents “that spill beyond an intended victim to involve others, including bystanders and collateral casualties. The NYPD excludes: gang-related shootings, shootings that solely occurred in domestic settings, robberies, drive-by shootings, attacks that did not involve a firearm, and attacks categorized primarily as hostage-taking incidents” (O’Neill et al. 2016: 5). Whether or not this decision to exclude incidents on the basis of relationships between perpetrators, places, and victims is useful for the policing data, it is routinely accepted by social scientists studying mass shooting incidents in ways that somewhat arbitrarily reduce the pool of incidents being analyzed. For a summary of the definitional dilemma associated with scholarship on mass shootings in the United States, see Smart and Schell (2021).

## Mass Shootings and Masculinity

four of the largest datasets used to discuss mass shootings incidents in the United States found that for 2017, only two incidents were in all four datasets (Booty et al. 2019). And the numbers of incidents included in the 2017 data ranged from 11 incidents to 346.<sup>4</sup> Booty, et al. (2019) concluded that fully documenting the burden of mass shootings on gun violence more broadly is simply not presently possible given the lack of a standard definition.

A brief consideration of two incidents in the United States helps to illustrate some of the issues with existing data. In the spring of 1999, two high school students in Littleton, Colorado entered their school with guns. They killed 12 students and injured another 21 people, and both died by suicide before either could be apprehended. The shootings at Columbine High School are known around the world but would nevertheless not be counted among “mass shootings” in all databases because there was more than one shooter (e.g., Stanford Mass Shootings in America database).<sup>5</sup> A separate incident involved a twenty-year-old man in Newtown, Connecticut who shot his mother in the morning before driving to Sandy Hook Elementary School, where she worked, shooting his way in, and killing twenty children and six adults before also dying by suicide. Not all datasets on mass shootings in the United States include this incident for two reasons: (1) the shooting occurred in more than a single location, and (2) the incident was first precipitated by family violence. For instance, the FBI, given their definitional criteria, ought to define the Sandy Hook shooting as a “spree killing.” Similarly, the 2020 Nova Scotia attacks

---

<sup>4</sup> In this study, even when relying on the most conservative criteria to define mass shootings (incidents involving only one shooter and four or more fatalities), incidents included in the 2017 ranged from 2 to 24 incidents (Booty et al. 2019).

<sup>5</sup> Interestingly, while the shooting at Columbine High School does not meet the definitional criteria for the dataset produced by *Mother Jones*, they nevertheless include this incident. Their criteria state that incidents are only included if “The killings were carried out by a lone shooter.” But that is followed up with two exceptions, both of which are school shootings, and one of those is the Columbine massacre. While it may be important to include Columbine, this speaks to some of the arbitrary decisions made in an attempt to fit into many existing datasets incidents that are popularly understood as mass shootings but otherwise resist being defined that way.

## Mass Shootings and Masculinity

resist easy classification. While the massacre was committed by a single person, media reports suggest that it began with an incident of intimate partner violence, involved guns and arson, and occurred at multiple locations over many hours. Depending on the dataset, this case would not “count” within the scholarly literature as a mass shooting.

What these incidents and definitional dilemmas bring into stark relief is the recognition that the majority of existing data and estimates of mass shootings around the world are best understood as under-inclusive estimates of the prevalence of incidents of the broader phenomenon that we are seeking to understand. And while the data that do exist have allowed us to better understand some of the most extreme and deadly mass shootings around the world, discovering patterns to learn more about incidents like mass shootings is challenging when the population of incidents remains small.

Learning more about mass shootings requires us to consider different ways of defining the very phenomenon we seek to better understand. We present data later in this report relying on a dataset of mass shootings that shares the criterion of one to two shooters with some existing research but parts with that work by defining incidents by the number of gun-related *injuries* (not fatalities) involved (including incidents in multiple locations and those that involve family, intimate partner, and gang violence). This allows us to examine this social problem with a much larger body of data and enables the identification of patterns that may be obscured by the narrower definitions underlying the majority of data and research on this topic.

## **2. Mass Shootings in International Perspective**

As a result of a lack of a central international database on mass shootings, statisticians and researchers are often unable to answer even the most basic social scientific questions about these tragedies. Answering a question like “How many mass shootings occurred in Canada last year?”

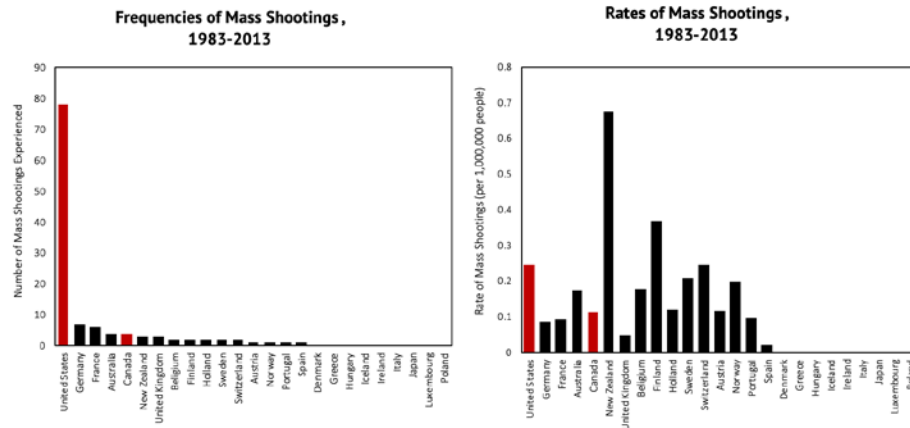

## Mass Shootings and Masculinity

sounds deceptively simple. It ought to be a straightforward matter of counting them. But there are two factors that shape our inability to answer this question. One factor has to do with how mass shootings are defined by scholars and other entities collecting and analyzing data on them. The second factor has to do with the availability of data that can be found to accurately enumerate a population of incidents once agreement on how to define them is achieved.

As a result of these challenges, the vast majority of research on mass shootings has tended to rely on relatively restrictive definitions. For example, Lemieux's (2014) work attempting to compare rates of mass shootings in a collection of 25 nations around the world between 1983 and 2012 utilized the number of fatalities as the defining factor. Lemieux defined mass shootings as incidents committed by one or more people that involved at least four fatalities as a result of the incident. In that period, according to the data Lemieux (2014) collected, the United States experienced 78 separate mass shooting incidents; and Canada experienced 4 (see our visualization of Lemieux's findings in the graph on the left in **Figure 1** below).

## Mass Shootings and Masculinity

Figure 1: Mass Shootings around the World, 1983–2013

Sources: Lemieux, Frederic. 2014. "Effect of Gun Culture and Firearm Laws on Gun Violence and Mass Shootings in the United States: A Multi-Level Quantitative Analysis." *International Journal of Criminal Justice Sciences* 9(1): 74-93.  
 2013 Population Estimates from The World Bank, IRBD.IDA. Available at: <https://data.worldbank.org>.

In **Figure 1**, we graph these data two ways, highlighting the United States and Canada on both graphs to illustrate a point about considerations of international comparisons. The graph on the left reports actual numbers of incidents in the defined period (frequency), while the graph on the right reports the same data but as a rate (per 1,000,000 people in the population) as opposed to a frequency. Relying on rates as opposed to frequencies in this way is sometimes utilized politically to make claims about incidents that are, when considered from a population perspective, relatively rare. For instance, the frequency of mass shootings around the world as depicted by the graph on the left in **Figure 1** shows the United States as an extreme outlier, while the graph on the right depicting rates of mass shootings shows the United States as experiencing a more average rate of incidence.<sup>6</sup> Because the United States has a larger population than every

<sup>6</sup> While disagreements exist in scholarly communities over which incidents to include when defining a dataset of mass shootings, there is a scholarly consensus that, however measured, the United States is an extreme outlier, experiencing more mass shootings than any other nation in the world by a large margin. The disagreements exist over precisely how large that margin is. (For a separate cross-national comparison of mass shootings around the world focusing on the United States as the outlier case, see Lankford 2016).

other nation in the figure above, it could be argued that it is simply more likely to experience mass shootings. Many demographic data like these for societies are provided as rates per 100,000 in the population (or per 1,000,000 people in the population for more rare phenomena) to provide a common metric to draw comparisons. In the graph on the right of **Figure 1**, we present Lemieux's (2014) data on mass shootings as a rate per 1,000,000 people in each nation's population (relying on 2013 population estimates). Presented this way, the United States, with a rate approximately double the rate of mass shootings in Canada per 1,000,000 people, no longer appears to be an extreme outlier. Instead, the outliers when Lemieux's (2014) data are presented in this way are New Zealand and Finland, nations with small populations that experienced three and two mass shootings respectively during the period of Lemieux's study.

A logical question to ask is whether frequency or rate is better to rely on when assessing the scale of a problem like mass shootings. And here, frequency offers more and better information than rate (Bridges and Tober 2019). The reason for this is that demographically, smaller populations or groups are more susceptible to random fluctuations when examining relatively rare events. This is why experiencing two or three mass shootings in a 30-year period propels some nations to the top of the list when examining the rate of mass shootings, as illustrated above by Finland and New Zealand. An instructive comparison is how medical research deals with similar phenomena. It is common practice to consider rates of particular diseases from populations lacking certain baseline frequencies to be unreliable data (see, e.g., Noordzij et al. 2010). It is simply not possible in these circumstances to distinguish random fluctuations from meaningful changes in the rate of the disease. A similar issue is at stake in examinations of mass shootings, which means that the graph on the right of **Figure 1**, albeit accurate, is a far less helpful representation of the problem of mass shootings. That graph ignores

the fact that the United States experienced almost twice the number of mass shootings in Lemieux’s sample as all of the other nations in the sample combined.

### 3. Shifts in the Frequency of Mass Shootings

Because of the lack of consensus surrounding how to define mass shootings, we also struggle answering questions about whether mass shootings are increasing in frequency. Answering the question of whether there are more of these incidents today than there used to be requires a shared definition. In this section, we present evidence documenting the increasing frequency of mass shooting-related incidents in the United States and also discuss shifts in the relative frequency of mass shootings internationally.

In 2013, US President Barack Obama signed HR2076, or the “Investigative Assistance for Violent Crimes Act of 2012,” granting the Attorney General the authority to, “at the request of an appropriate law enforcement official,” investigate mass killings and attempted mass killings, defined as “three or more killings in a single incident” with guns.<sup>7</sup> This resulted in a series of studies conducted by the FBI on what it called “active shooter incidents,” in which an individual (or, in some cases, individuals) was/were engaged in killing or attempting to kill

---

<sup>7</sup> In 1996, Congress passed (with heavy backing from the National Rifle Association) the Dickey Amendment to an omnibus spending bill in response to efforts to treat the gun violence so rampant in the 1990s as a public health issue (Rostron 2018). The amendment forbids the Centers for Disease Control, which studies anything that has an impact on public health (not only disease), from using money to advocate or promote gun control. This was in response to a study (Kellermann et al. 1993) that found that gun ownership was a risk factor for homicide in the home. Congress also lowered the CDC budget by the exact amount it previously had spent on gun research. The Amendment did not technically forbid research about gun violence but instead restricted formal proposals that called for gun control. It did have the effect of restricting gun control, however, because it was (and is) unclear where exactly that line between research and recommendations is; and federal employees have appeared unwilling to risk their careers in order to find out. In 2011, the Dickey Amendment was extended to include both the CDC and the National Institute of Health (Rostron 2018). After the events at Sandyhook Elementary School, Obama directed the CDC to not treat the Dickey Amendment as a ban on gun violence research and signed an executive order directing the National Institute of Health (NIH) to fund research into gun violence. Congress thereafter denied the request for funds, and the program was discontinued (Zhang 2018). More recently, legislation in 2018 clearly states that federal funding can support gun research, but the line between research (allowed) and policy recommendations (not allowed) remains unclear. Even if this line is clarified, researchers in the United States are faced with an incredible lack of data because both funding and opportunity for research has been so limited.

people by firearm. These are not all mass shooting incidents but rather incidents *like* mass shootings, or incidents that might have become mass shootings, in which authorities had the opportunity to intervene to possibly change the outcome and save lives. **Figure 2** shows the frequency of active shooter incidents between 2000 and 2020 from two separate FBI reports.<sup>8</sup>

*Figure 2: Frequency of “Active Shooter” Incidents in the United States, 2000–20*

Note: In 2019, the Federal Bureau of Investigation released new figures for many of the early years for which they collected data indicating that they had undercounted incidents. These figures represent the updated data, consistent with 2019 and 2020 reports.

Sources: U.S. Department of Justice, Federal Bureau of Investigation. "Active Shooter Incidents: 20 Year Review, 2000-2019." May 2021. Available at: <https://tinyurl.com/mt53345y>.  
U.S. Department of Justice, Federal Bureau of Investigation. "Active Shooter Incidents in the United States in 2020." July 2021. Available at: <https://tinyurl.com/2p82jtdt>.

FBI active shooter reports and data demonstrate that the frequency of mass shootings and incidents like mass shootings, despite being relatively rare, has increased over time. In 2000, the FBI discovered only three incidents that qualified as incidents involving active shooters in the United States. By 2020, that figure increased more than thirteen times to 40 separate incidents.

<sup>8</sup> Despite the short span of time in which the FBI has been studying active shooter incidents, they have already changed the frequencies of incidents for years prior to 2019 in the data set because they realized they had undercounted incidents (FBI 2021a). This is important, as it speaks to the fact that estimates of mass shootings and incidents similar to mass shootings have always been conservative estimates of the actual frequency of these incidents.

And these data are consistent with other work on mass shootings showing that the frequency of mass shootings in the United States has been increasing (i.e., Follman 2014; Bridges and Tober 2019).

Comparable data are not available in other nations. But trends in the United States surrounding gun violence may simply be on a more exaggerated trajectory than many other nations. For instance, in 2020 Canada’s homicide rate was approximately 1.95 per 100,000 people; the analogous figure from the United States was 7.8 per 100,000 people (Statistics Canada 2020; National Center for Health Statistics 2020). Homicide rates in both nations increased in 2020, with Canada’s being the highest in approximately fifteen years.<sup>9</sup> And while mass shootings are much rarer in Canada than in the United States, there have been a number of highly publicized incidents in Canada since the 1989 shootings at École Polytechnique.<sup>10</sup>

#### **4. Mass Shootings, Gun Violence, and the Importance of Understanding “Gun Culture”**

The pro-gun National Rifle Association (NRA) in the United States has made the slogan “Guns don’t kill people; people kill people” famous internationally and is popularly associated with pro-gun activists and advocacy in the United States, as well as in other nations. The slogan is used to argue that guns are not the real problem when it comes to homicides, suicides, and other gun-related crimes. The slogan takes an instrumental approach to guns, suggesting that they are

---

<sup>9</sup> Because of Canada’s relatively small population, the events in Nova Scotia in April 2020 account for part of the increase in the 2020 homicide rate.

<sup>10</sup> The mass shooting at École Polytechnique (Université de Montréal) in 1989 is among the mass shootings around the world that brought attention to mass shootings from gendered perspectives. The perpetrator was explicitly anti-feminist, and the incident ended with him killing fourteen women and injuring another ten women and four men. The perpetrator claimed to be “fighting feminism” as he entered a classroom on campus, separated the women and men, and began shooting. This incident prompted anti-violence activist efforts like the White Ribbon Campaign, which is now among the largest nonprofit campaigns to raise awareness and understanding surrounding gender-based violence worldwide.

nothing more than a tool. From this perspective, any harm done with guns is entirely attributable to the person who causes that harm, and not to the means they use to do so.

The problem with the slogan and the instrumental approach to gun violence is that they treat guns and the people who wield them as though they are separable in ways they are not. When humans interact with guns, the interaction is transformative because of the cultural meanings attached to guns—meanings that are not everywhere and for everyone exactly the same. In the 1960s, psychologists theorized the “law of the instrument” (Maslow 1966). Interactions between humans and technology are both complex and transformative. Maslow distilled this concept simply: “I suppose it is tempting, if the only tool you have is a hammer, to treat everything as if it were a nail” (Maslow 1966: 15–16). Maslow’s point was that holding a hammer alters the ways hammer-holders see the world around them. The act of holding the tool transforms the person holding it. When holding a hammer, the world around you takes on a distinct kind of form and shape. To someone holding a hammer, nails and nail-like things come into sharp relief. A hammer is a tool with a specific purpose, and to anyone aware of the meaning and use of the tool, holding it recommends considering those uses. Guns are similarly transformative in the way they can affect gun-users (Wade and Sharpe 2012).

Additionally, guns are transformative in a separate way: when one person is holding or pointing a firearm, or even if the threat to do so is present, the behaviors and emotions of other people in the vicinity are also transformed. This was a point made in the Supreme Court of Canada in the case of *R v Felawka*. As Justice Cory explained:

A firearm is expressly designed to kill or wound. It operates with deadly efficiency in carrying out the object of its design. It follows that such a deadly weapon can, of course, be used for purposes of threatening and intimidating. Indeed, it is hard to imagine anything more intimidating or dangerous than a brandished firearm. A person waving a gun and calling “hands up” can be reasonably certain that the suggestion will be obeyed. A firearm is quite different from an object such as a carving knife or an ice pick, which will normally be used for legitimate purposes. A firearm, however, is always a weapon. No matter what the intention may be of the person carrying a gun, the firearm itself

## Mass Shootings and Masculinity

presents the ultimate threat of death to those in its presence (*R v Felawka* [1993] 4 SCR 199).

Here too, as Justice Cory argued, guns are not simply instruments. They have the capacity to transform the world around them. And they are different from Maslow’s hammer too in that a hammer can be used as a weapon, but a firearm “is always a weapon.” This is important because when seeking to understand gun violence, guns are not best understood from an instrumental approach. As such, designing policies only around instrumental understandings of guns is misguided and dangerous.

The cultural significance and meanings firearms acquire are important to understand because firearms do not *mean* precisely the same things everywhere, and they take on different kinds of meaning for different groups even within a single society. And in many societies, firearms are gendered “masculine” (Levin and Madfis 2009; Bridges and Tober 2019).

As illustrated above, mass shootings must be understood in conversation with legislation surrounding gun control and ownership. Civilian firearm ownership rates and legislation surrounding gun ownership and gun control are correlated with mass shootings the world over. Simply put, nations with more civilian-owned firearms have more mass shootings (Lankford 2016). But comparing Canada and the United States is instructive in thinking about the relationship between guns and mass shootings in different nations around the world. While **Figure 3** shows that the United States is a more extreme outlier in the rate of civilian-owned firearms, Canada still has the sixth highest rate of civilian gun ownership in the world.<sup>11</sup> The United States stands out in international perspective in two ways worth highlighting here. First, the US civilian-owned firearms rate is more than twice as high as any other nation. In addition,

---

<sup>11</sup> Internationally, civilian firearm ownership is concentrated in the United States. While US citizens account for roughly 4% of the global population, the Small Arms Survey estimates that American civilians own approximately 46% of the 857 million civilian-owned firearms in the world (Karp 2018).

Mass Shootings and Masculinity

the United States stands out as the only nation where the number of civilian-owned firearms exceeds the population—a nation with more guns than people.

Figure 3: International Civilian-Owned Firearms Rates, 2017

Source: The Small Arms Survey, Civilian Firearms Holdings, 2017 (Civilian-Owned Firearms rates)  
 Note: Data presented in this figure only visualize nations with >15 civilian-owned firearms per 100 persons in the population.

Notably, despite scholarly disagreements about how to best measure mass shooting incidents, there is broad scholarly consensus that gun ownership rates are correlated with mass shooting incidents; nations with more guns, in general, experience mass shootings. Lankford (2015) found that a country’s rate of gun ownership increased the odds it would experience a mass shooting. This relationship held even when excluding the United States (an outlier) and when controlling for homicide rates (Lankford 2015). A comparison of Canada and the United States, however, illustrates that a focus only on the rate of gun ownership is insufficient to explain a social problem like mass shootings. The frequency of US mass shootings is consistent with the rate of civilian-owned firearms—there are many more guns there, and the United States

## Mass Shootings and Masculinity

experiences many more mass shootings. But there are more civilian-owned firearms in Canada than all but five other nations in the world; yet Canada has experienced a similar number of mass shootings to nations with much lower gun ownership rates. Simply put, gun scholars (e.g., Yamane 2017; Carlson 2020) argue that guns are a necessary but insufficient explanation for various types and rates of gun violence.

Thus, firearms are only one piece of the social problem of gun violence, and research shows that guns are not the same piece of this larger social problem in Canada as they are in the United States. For example, in 2020, gun-related killings accounted for 79% of all US homicides; in Canada, gun-related killings accounted for 37% of all homicides in 2020 (see **Figure 4**).<sup>12</sup> As noted previously, in 2020, the homicide rate in the United States was approximately four times larger than the homicide rate in Canada. But even within those incidents, a much smaller share involved firearms in Canada than in the United States.

---

<sup>12</sup> In fact, a study published in the *Journal of the American Medical Association* (Global Burden of Disease 2016 Injury Collaborators 2018) found the US ranked eighth in a comparison of age-adjusted rates of homicide by firearm in a dataset including 64 nations. The nations ranked above the United States were Puerto Rico (a US territory), the Bahamas, the US Virgin Islands (also a US territory), Trinidad and Tobago, Saint Kitts and Nevis, Panama, and Barbados. The same study found that Canada was ranked twentieth, with a rate roughly 12% of the US rate. The same study found that firearm injuries and deaths were more common in nations where firearms are more easily accessible. Similarly, within the United States, a comparative analysis and review of research on state legislation and firearm laws and firearm homicides found a sharp reduction in firearm homicide accompanying legislation strengthening background checks or requiring permits for the purchase of firearms (Lee et al. 2017).

*Figure 4: Gun-Related Killings as a Proportion of All Homicides in the USA and Canada, 2020*

Sources: Federal Bureau of Investigation, Crime in the United States Annual Reports, 2020; Statistics Canada, 2020.

The fact that there is a collection of nations with high rates of gun ownership yet radically different rates of gun violence has prompted scholars studying guns and society to investigate distinctions between national gun cultures. “Gun culture” is generally used to refer to specific historic and contemporary attitudes, norms, and laws surrounding gun ownership and use. Simply put, gun culture encompasses the meanings attributed to guns within specific cultural settings (Yamane 2017; Carlson 2020). As such, gun cultures vary a great deal by nation. Much scholarship examining gun cultures internationally has commented on the uniqueness of gun culture in the United States (e.g., Carlson 2015a; Carlson 2015b; Stroud 2016; Yamane 2017). Carlson’s (2015a; 2015b) comparisons of Canada and the United States are illustrative. She has suggested that something as complex as gun culture cannot be fully captured by simple variables like rates of gun ownership. For example, she has considered the most prevalent kinds of guns owned in these two countries: in Canada long guns are more commonly owned than handguns; in the United States, the reverse is true. Long guns and handguns have different meanings and uses,

## Mass Shootings and Masculinity

with the former more likely to be used for hunting, while the primary use of handguns is for target shooting and self-defense.<sup>13</sup>

Sociologist David Yamane (2017) has argued that this shift in the United States in types of guns was accompanied by shifting gun cultures as well. While a gun culture associated with hunting and recreation predominated in the early twentieth century, by the 1970s, the meanings associated with guns and gun ownership had shifted in the United States toward armed self-defense, an ideology Yamane has labeled “gun culture 2.0” (2017). It could be the case that the gun culture in Canada is more similar to pre-1970 US gun culture.

Yet treating nations as though guns have the same meanings for everyone who resides inside their borders is overly simplistic. In a globalized world, individuals can be influenced by gun cultures the world over, and the gun cultures of various nations are also capable of influencing each other. For instance, some research suggests that US gun culture has influenced the gun cultures in other parts of the world, including the association of guns with freedom—a connection made by gun rights advocates and activists in the United States that is now popularly celebrated around the world and influencing both gun ownership and use (see Carlson 2014). Our research also investigates whether it is possible to consider differing gun cultures as existing within the same societies, which may also help in understanding the frequencies of mass shootings by state within the United States. Following from that, we discuss the importance more generally of considering different gun cultures within a single nation as possible factors affecting mass shootings.

---

<sup>13</sup> Also considering the effects of US gun culture to mass shootings in the US, Lankford (2015) did a comparative analysis of mass shooters in the United States and other countries, concluding that mass shooters in the United States are more likely to arm themselves with multiple weapons and attack places such as schools and workplaces. Shooters in other countries are more likely to strike at military sites. Lankford (2015) attributed these differences to “America’s national gun culture.”

### III. New Definitions and Research: State-Level Data from New Research on Mass Shootings in the United States

Existing research relies on varying criteria to define mass shooting incidents. But the majority of research shares a common focus on incidents defined by three broad criteria: (1) incidents involving a single shooter; (2) incidents involving at least three fatalities (not including the shooter); and (3) incidents that are not associated with family, intimate partner, or gang violence. Given these parameters and subject to additional criteria that some scholars and organizations adopt when defining incidents, there are approximately 25–30 incidents annually in the United States that meet this definition. To be clear, this number far exceeds frequencies in any other nation in the world, and we consider it to be unacceptably high. But from a research perspective, the overall sample is small, which makes identifying patterns among these incidents more challenging.

Following the shooting events at Sandyhook Elementary school in Connecticut in 2012, a new nonprofit research group called the Gun Violence Archive attempted to produce a new dataset on US mass shootings.<sup>14</sup> Rather than using highly politicized public figures, Gun Violence Archive sought to collect new data on incidents involving one or two shooters that met a minimum threshold of gun-related *injuries* (not necessarily fatalities). Data was collected from news media reports on shootings in the United States involving four or more gun-related injuries; data also incorporated incidents involving family, intimate partner, or gang violence that met

---

<sup>14</sup> The United States does not systematically collect data on many different issues pertaining to guns and gun violence in the US as a result of the Dickey Amendment, as noted above in fn 7. As a result, some of the best data available have been collected by media organizations like *Mother Jones* and nonprofit organizations like Gun Violence Archive (GVA). And while Gun Violence Archive relies on the broadest definition of “mass shooting,” allowing them to collect information on a larger population of incidents, data are collected from news stories on shootings around the United States. Because of that fact, it is best understood as a conservative estimate of incidents. Despite this, these are some of the best data we have on this type of gun violence in the United States.

## Mass Shootings and Masculinity

these other criteria.<sup>15</sup> To these data, we have added a host of other variables that enable us to examine how incidents involving intimate partner, family, or gang violence are similar to and/or differ from other mass shooting incidents. Similarly, we have also examined how media report on different types of mass shootings, how perpetrators and victims are framed, and many other issues.

Building on the work of the Gun Violence Archive, our research provides a much larger population of mass shootings to examine. For instance, most research relies on a definition of mass shootings that would produce a population of US mass shooting incidents between 2013 and 2019 of approximately 200 separate incidents. Our cleaned version of data collected by Gun Violence Archive has a population of 2,543 separate incidents over the same period. By loosening the definitional criteria to include incidents based on injuries (not fatalities) and including incidents regardless of motive, relationship, or circumstances, these data offer a much clearer picture of the scope of gun-related mass violence in the United States.<sup>16</sup>

Given a larger population of incidents, it is also possible to look at and analyze these data in ways that would not be meaningful with datasets generated via narrower but more commonly adopted definitional criteria. And while the United States has a gun culture that is unique internationally and puts Americans at greater risk of experiencing mass shootings (see, e.g., Bridges and Tober 2016; Bridges and Tober 2019; Lankford 2016; Lemieux 2014), examining a

---

<sup>15</sup> For a more detailed account of their methodology, see <https://www.gunviolencearchive.org/methodology>.

<sup>16</sup> Gun Violence Archive is intentionally more inclusionary of disparate types of gun-related incidents involving four or more of victims by firearm (fatalities or injuries). They include incidents that happen in more than a single location (referred to as “spree killings” by the FBI), gun-related instances of family violence, and intimate partner violence, in addition to gang-related or potentially gang-related shootings. That is, GVA does not differentiate victims for inclusion based on the number of fatalities involved in the incident, the circumstances in which they were shot, or the type of relationship they had with shooters. While scholarship relying on the FBI definition of “mass murders” by firearm is useful in identifying some of the most fatal events, whether or not these criteria merit the exclusion of incidents classified out of existence as “mass shootings” by such a definition inhibits a more expansive study and analysis of a much larger population of incidents.

larger number of incidents also allows us to begin to interrogate whether multiple gun cultures exist in the United States and, if so, how they might be connected with mass shooting incidents.

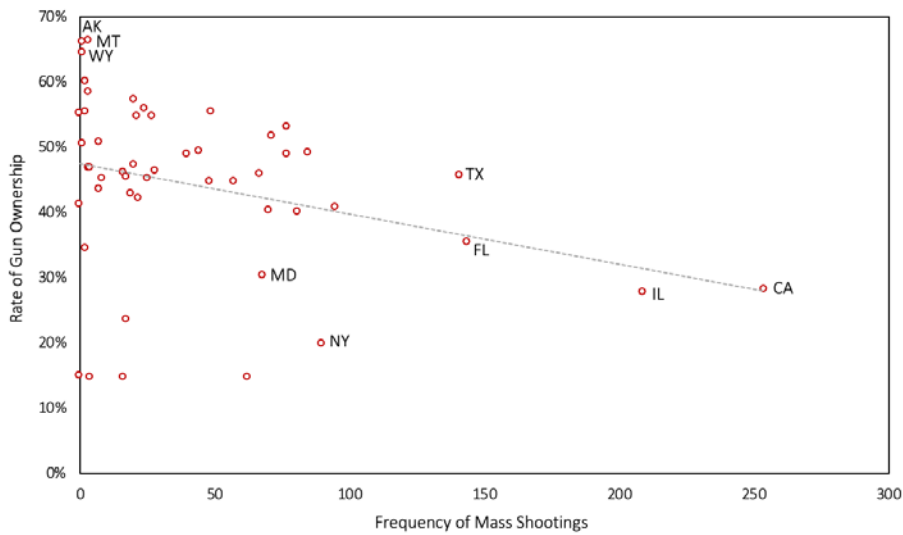

In **Figure 5** below, we plot the frequencies of mass shooting incidents from our dataset between 2013 and 2019 by US state against rates of gun ownership by state. Interestingly, states with the highest rates of gun ownership (Alaska, Wyoming, and Montana) have among the lowest numbers of mass shootings. This suggests that one way of examining gun cultures in the United States is to consider whether there are state-specific gun cultures that might differ more or less from a larger national gun culture. Alaska, Wyoming, and Montana also have among the highest proportions of their populations living in rural contexts, a factor that may affect gun culture and gun violence.<sup>17</sup>

---

<sup>17</sup> This does not mean that gun violence is absent in rural contexts but rather that this particular type of gun violence may be less present in rural contexts. In other words, different types of gun violence may be typical of contexts shaped by various gun cultures. For instance, it is also the case that states with among the highest rates per capita of firearm mortality have among the lowest proportions of their populations living in urban areas. This is in part due to high rates of suicide by firearm among white men, a figure including a disproportionate number of white men living in rural areas in the United States.

## Mass Shootings and Masculinity

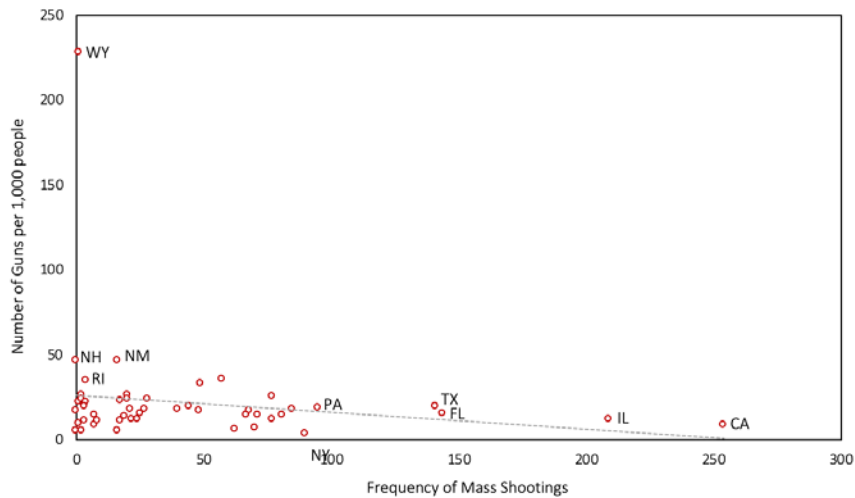

Figure 5: Frequency of Mass Shootings by State Compared to Rates of Gun Ownership, 2013–19

Sources: Tristan Bridges and Tara Leigh Tober Mass Shootings in America Database, based on data collected initially from Gun Violence Archive (mass shootings frequencies); RAND Corporation (gun ownership rates)

**Figure 5** makes clear that guns are only a piece of the problem. States with among the highest rates of gun ownership simply have too few mass shooting incidents for rates of gun ownership to be the only explanation for this social problem. Similarly, when we look at raw numbers of guns (**Figure 6**), there is less of a relationship between guns per capita by state and frequency of mass shootings than might be expected if the major issue at play were access to guns.

Figure 6: Frequency of Mass Shootings by State Compared to Guns per Capita, 2013–19

Sources: Tristan Bridges and Tara Leigh Tober Mass Shootings in America Database, 2013-2019, based on data collected initially by Gun Violence Archive (mass shootings frequencies); World Population Review, 2021 (guns per capita)

These data suggest that we ought to focus more on examining what scholars refer to as “gun culture” by, in particular, analyzing the extent to which different states may have different gun cultures. For instance, preliminary research (e.g., Reeping et al. 2019) has suggested that the relative restrictiveness/permissiveness associated with US state-level gun laws and gun ownership is significantly related to differences in state-level rates of mass shootings. Our data help us better understand the extent of the relationship between gun laws, rates of ownership, and mass shootings.

But guns alone are insufficient to explain mass shootings, as mass shootings also have to do with the meanings associated with guns. Next, we summarize what scholars refer to as “gun culture” and how this concept helps to explain the meanings and significance of guns in society. That body of scholarship has consistently shown that gender is an important factor in our understandings of firearms and gun culture more broadly. Following that, we explain what it

means to argue that scholarship shows that guns and gun cultures are gendered social phenomena.

#### **IV. Mass Shootings and Gender**

Gun ownership, gun-related fatalities, and gun violence more generally are all gendered phenomena. Men are more likely than women to own guns; men are more likely than women to die by suicide via firearms; and men commit more gun homicides than women. And these gender gaps are more extreme when it comes to mass shootings. Men commit the overwhelming majority of mass shootings worldwide, and this general trend is dramatically illustrated in the United States. Our research suggests that mass shootings are a gendered issue: they fundamentally have to do with the relationship between men, masculinity, and guns. Notably, however, men with access to guns in the rest of the world do not commit mass shootings in the same numbers or at the same rates as American men. In other words, the relationship between guns and masculinity is especially important to understanding the phenomenon of mass shootings in the United States in particular. But the relevance of gender to gun culture more generally and to mass shootings particularly is instructive for other parts of the world as well, including Canada.

Answering the question of why American men commit the overwhelming majority of mass shootings requires a two-part sociological explanation: a social psychological explanation of why men turn to this type of violence so much more frequently than women do; and a cultural explanation to clarify what it is about American masculinity that causes the United States to stand out internationally when it comes to this particular type of gun violence (Bridges and Tober 2016; Bridges and Tober 2019).

### **1. Part I: A Social Psychological Explanation of the Relationship between Mass Shootings and Masculinity**

Attempts to better understand both what gender is and how it works have resulted in an enormous body of social scientific scholarship, particularly in the last half century. Scholars in different disciplines have come up with unique ways to define the notions of “masculinity” and “femininity” and to consider what they mean and how they work. Beliefs about what it means to “be a man,” for instance, are variable. Men are not inherently more violent than women, but in many societies, social and cultural understandings of what it means to be a man are tied to violence. Because masculinity has meant different things over time and continues to have diverse meanings today, scholars such as James Messerschmidt (2000a; 2000b) have charted new intellectual ground that is particularly useful in understanding the relationship between men, masculinity, and violence. In a life history analysis of adolescent American boys, Messerschmidt examined what he has referred to as “masculinity challenges,” that is, “contextual interactions that result in masculine degradation” (2000a: 13). In other words, masculinity challenges refer to interactions in which a boy’s (or man’s) sense of himself as “masculine” is openly contested. Messerschmidt was interested in both the challenges themselves as well as how adolescent boys sought to resolve such challenges in patterned ways.

Messerschmidt has approached masculinity (and gender more broadly) from a sociological perspective, as something that is constructed socially in interactions with others (West and Zimmerman 1987), and he is particularly interested in how masculinity is accomplished in contexts and moments when boys’ claims to masculine identities are called into question. In such moments, Messerschmidt has argued that the boys in his study reached for what he terms “masculine resources” to bolster their claims to gender identities they perceived as challenged or threatened (Messerschmidt 2000a). Masculine resources refer to anything that can

## Mass Shootings and Masculinity

be relied upon to restore challenged masculine gender identities. What people who are invested in masculine gender identities reach for when they perceive their gender identities to be threatened provides important information about cultural understandings of masculinity in the first place.

Similarly, a small body of research also exists on what Karen Pyke (1996) has called “compensatory masculinity,” or what other scholars (e.g., Schrock and Schwalbe 2009) have referred to as “compensatory manhood acts”: the specific displays of masculinity enacted by groups of boys and men whose claim to masculine-gendered identities might be structurally or interactionally called into question. We bring this up here because it is an interesting social scientific way of attempting to study something as slippery as “masculinity.” Rather than attempting to define it, one way of getting at lay understandings of masculinity is to look at how people respond when their claims on the identity are either tenuous or have been challenged. This allows the composition of what people think of as “masculine” to change but allows social scientists to chart its varied meanings.

Following this early research, social psychologists have examined the notions of “masculinity challenges” or “compensatory masculinity” in controlled experimental settings, allowing us to subject these findings to new and different kinds of scrutiny. This type of scholarship in social psychology is concerned with “masculinity threats” (a specific form of “social identity threats”). The research in this area is predominantly experimental. People come into labs, and scholars experimentally “threaten” the gender identities of some of them while “confirming” the gender identities of others, observing how those whose gender identities were threatened respond differently and in patterned ways.

Scholarship on social identity threat has come up with a few important and testable findings. One of the most important discoveries is that when people are invested in a particular identity and that identity is called into question or challenged, responses are socially patterned: a predictable response is to engage in exaggerated behavior that might symbolically authenticate their membership in the questioned identity category (Branscombe et al. 1999). The work that has applied this specifically to masculinity tests what social psychologists refer to as the “masculine overcompensation hypothesis” (see Willer et al. 2013): the notion that men whose gender identities as “masculine” have been challenged will respond with exaggerated demonstrations of masculinity. So in consideration of what masculinity is or how we might define it, social psychological research shows that we can best understand what masculinity means to people if we find a group invested in that identity, experimentally take it away from some of them, and see what they reach for in response.

Scholarship on “masculinity threat” or the “masculine overcompensation hypothesis” has relied on a few different methods to experimentally “threaten” some men’s gender identities. For example, Munsch and Willer (2012) brought a range of participants into a lab and asked them to complete a “Gender Identity Survey” (with questions drawn from existing psychological surveys on gender differences, such as the Bem Sex Role Inventory). Subsequently, the participants were randomly assigned to receive either gender-confirming feedback from the survey (indicating that they scored in the average range for men) or gender-disconfirming feedback (indicating that they scored within the average range for women). This latter condition is the “masculinity threat” condition.<sup>18</sup> These two groups were subsequently asked to complete different kinds of tasks in

---

<sup>18</sup> While not all research on “masculinity threat” has utilized the same threat measure, this is the measure that has proven most reliable across studies in the body of scholarship on the topic (see, e.g., Willer et al. 2013; Munsch and Willer 2012).

## Mass Shootings and Masculinity

order for the researchers to study differences between the groups' responses to subsequent tests and tasks. Examining what it is that men whose masculinity has been experimentally threatened reach for to "over-demonstrate" masculinity offers a unique window into what is understood as masculine in the first place. Simply put, using Messerschmidt's (2000a) language, masculine resources are easier to identify when we examine responses to masculinity challenges.

Research on masculinity threats is ongoing, but existing research has produced a collection of disturbing results that help us better understand the relationship between masculinity and violence. For instance, Munsch and Willer (2012) had men read scenarios involving sexual coercion or force by men against women and found that men whose masculinity had been experimentally threatened were less likely to identify sexual coercion as sexually coercive and more likely to blame the women victimized in the scenario. Similarly, Willer et al. (2013) subjected the masculinity overcompensation thesis to a larger number of issues, discovering that men whose masculinity had been threatened were more supportive of violence and war as a solution to problems, more likely to agree with male supremacist statements, more supportive of prejudice toward gay men, more likely to identify as Republican, and even more likely to say that they wanted to purchase a sport utility vehicle. This research suggests that violence is a masculine resource on which men are more likely to rely when their masculinities have been challenged. Indeed, as Levin and Madfis have argued, "In American culture, the masculine role is frequently defined by elements of dominance, violence, and militarism" (2009: 1242). Social psychological research on masculinity threat offers us new methods of appreciating this relationship.

Moreover, some work specifically links threats to gender identity with guns in the United States. For instance, a recent study found that worsening economic conditions for men are

associated with increased gun sales, and men who perceive higher levels of masculinity threat are less supportive of gun control measures (Cassino and Besen-Cassino 2020). As an extensive body of scholarship ties masculinity to work, occupations, and career (for a summary, see Bridges, Taylor, and Robinson 2020), worsening economic conditions structurally provide fewer opportunities for men to demonstrate masculinity via paychecks and provision. When fulfilling the gendered role of “provider” becomes less available, scholars have found that some men shift their understandings of masculinity to support another gendered role in society—the “protector” (see Carlson 2015a; Stroud 2012; Warner et al. forthcoming). From this perspective, worsening economic conditions can serve as cultural-level masculinity threats. Cassino and Besen-Cassino (2020) have found that owning or carrying a gun is a symbolic gendered enactment among American men—it helps men construct and affirm their gendered identities (see also Carlson 2015a and Stroud 2012). And other research on guns as a masculine resource has helped to explain men’s relationships with guns and the relationship between mass shootings and masculinity in particular (Levin and Madfis 2009; Madfis 2014; Pfaffendorf, Davis, and Kinney 2021).

Identifying patterns in the motivations of mass shooters is challenging from a sociological perspective. One way that sociologists examining US mass shootings have sought to do this is to analyze public “manifestos” of mass shooters, as many incidents have involved such statements. Using topic modelling and textual analysis, Pfaffendorf, Davis, and Kinney (2021) have recently analyzed publicly available mass shooter manifestos from the United States and discovered that masculine overcompensation, ritualistic responses to exclusion, and racialized status threat (concerns over the status of white people ) were patterned motives mentioned in these documents. Their study provides new empirical support for our framework for

## Mass Shootings and Masculinity

understanding the relationship between masculinity and mass shootings (see also Bridges and Tober 2016; Bridges and Tober 2019). Madfis's (2014) findings among school shooters also reveals that interactional-level masculinity challenges are important factors in explaining these events.

Mencken and Froese (2019) have found that men in the United States, particularly white men, who have recently experienced an economic setback or even fear experiencing one are more likely to see owning a gun as emotionally and morally empowering. And while the most popular response justifying gun ownership among American men is "protection" (Parker et al. 2017), Warner et al. (forthcoming) have recently discovered that men who are parents and/or partners are no more likely to rely on this justification of gun ownership than men who are not, a fact Warner et al. argue implies that protective gun ownership and men's relationships with guns in the United States are less about protecting one's family and more about protecting claims to masculinity and gendered forms of power and authority. Both Mencken and Froese (2019) and Warner et al. (forthcoming) have found that among men in the United States, economic precarity is meaningfully related to guns—both interest in owning guns and understanding them as emotionally empowering. This suggests that masculinity threats not only happen interpersonally and in individual interactions but might also be something we can study at the cultural level (see also Carian and Sobotka 2018).<sup>19</sup>

From a public health perspective, understanding whether and how work, career, and notions of "providership" are tied to notions of masculinity for men in different cultural contexts and groups is important. Research on guns in the United States suggests that as "providership"

---

<sup>19</sup> Research on guns in the United States suggests that as "providership" becomes a more challenging identity for men to claim as the economy transforms in ways that create more opportunities in economic sectors dominated by women and fewer in those dominated by men, men turn to "protection" to demonstrate their gender identities (see Carlson 2015a).

becomes a more challenging identity for men to claim as the economy transforms in ways that create more opportunities in economic sectors dominated by women and fewer in those dominated by men, men turn to “protection” to demonstrate their gender identities (see Mencken and Froese 2019; Carlson 2015a; Carlson 2015b; Stroud 2012; Warner et al. forthcoming).

Messerschmidt’s (2000a) research with young boys also supports the notion that masculine threats provoke violence. He found that violence is not simply a masculine resource but *the* resource boys and young men turn to in a crisis. More recently, Willer et al.’s (2013) experimental research has supported the finding that violence remains an important resource that men turn to in order to demonstrate masculinity when they perceive a challenge to this identity.<sup>20</sup> Understanding mass shootings as an extreme manifestation of the violent gendered behavior documented by social psychologists helps explain why crimes like mass shootings are so overwhelmingly committed by men—these crimes are often productively understood as enactments of masculinity in response to perceived masculinity threats. Less work has explicitly considered the ways masculinity challenges can also occur at structural and cultural levels. But larger, more macro-level cultural shifts help to explain the increasing frequency of such violence in ways that a social psychological perspective alone cannot and also help to answer a separate question: why *American* men? That question requires a cultural explanation.

## **2. Part II: A Cultural Explanation of the Relationship between Mass Shootings and American Masculinity**

Certainly, American boys and men are not the only boys and men who have their gender identities threatened. A full explanation of the relationship between masculinity and mass

---

<sup>20</sup> Importantly, scholarship on masculinity threat has primarily been conducted on men in the United States. Because we know that understandings of masculinity are different around the world, whether men in different societies would also respond to experimental threats to their gender identities and whether they would respond in ways that are similar to the documented responses among US samples of men is something we need more research to confirm.

## Mass Shootings and Masculinity

shootings has to account for why American boys and men in particular commit these crimes more than boys and men anywhere else in the world. This question requires a cultural explanation—one that attends to the unique role that American culture plays in influencing boys and young men in the United States to turn to this type of violence at such higher rates than boys and men elsewhere. Addressing this requires shifting our attention away from the individual characteristics of the shooters themselves to focus on the sociocultural contexts in which violent masculinities are both produced and valorized (see Carlson 2014; Carlson 2015a; Tonso 2009).

In tracing the history of the use and sociocultural meanings associated with firearms in the United States, sociologist David Yamane has helped to outline what a sociological analysis of gun culture might look like and how it might be useful. According to Yamane (2017), colonial-era Americans regarded guns as tools that were necessary for life on the frontier,<sup>21</sup> but this relationship changed over time as sport hunting and shooting, as well as activities like gun collecting, came into fashion as pastimes and lifestyle pursuits for American men. Indeed, among the unique elements of gun ownership and culture in the United States is the fact that the average gun owner owns far more firearms than the average gun owner in other comparable societies around the world—gun-owning households in the United States own an average of about eight guns (Ingraham 2018).<sup>22</sup>

---

<sup>21</sup> This is significant as it relates to Maslow's law of the instrument, discussed above, as it pertains to firearms. It is possible to view guns as tools, as Yamane's (2017) overview of the changing meanings of guns attests. Though even here, tools are transformative in the ways Maslow suggested. But the meanings associated with firearms when they were primarily understood as tools is distinct from subsequent periods.

<sup>22</sup> Note that the average calculation is not entirely useful here, as outliers with extremely large collections skew the data. The Pew Research Center has found that among gun owners in the United States, about one third own only a single firearm; another third owns between two and four guns; and the final third of American gun owners own five or more guns (Parker et al. 2017). Available data suggest that this latter share of gun owners is much larger in the United States than in comparable nations around the world.

And while Yamane has argued that these recreational meanings associated with guns and gun culture are still present in the United States, the meanings associated with guns shifted again more recently (starting in the 1970s) toward notions of armed self-defense—something Yamane (2017) refers to as “Gun Culture 2.0.” Surveys of American gun owners have documented this shift as well. In 2017, the Pew Research Center found that among American gun owners, only 8% claimed to own a gun for work, 13% claimed to be collectors, 30% owned guns for sport shooting, 38% for hunting, but a full 67% stated that their major reason for owning a gun was “for protection” (Parker et al. 2017).<sup>23</sup> Indeed, what sociologists now refer to as “protective gun ownership” is on the rise, and (as further explained below) important research has documented the gendered ways men in particular lean on this new logic (e.g., Stroud 2012; Stroud 2016; Carlson 2015a; Carlson 2015b). Both Carlson (2015a) and Stroud (2016) have also commented on the racialized nature of this discourse, noting that white men in particular lean on this logic of gun ownership and armed protection: white men in the United States are much more likely than white women to own guns, but also more likely than men of colour (Parker et al. 2017).<sup>24</sup>

In Jennifer Carlson’s research on gender and American gun ownership (2015a; 2015b), many men she interviewed spoke about a very specific kind of “nostalgic longing for a particular version of America” (2015b: 390). Some invoked it by name, referring to it as “Mayberry,” referencing the fictional US town from the 1960s American family sitcom *The Andy Griffith*

<sup>23</sup> A separate representative survey of American gun owners conducted by Gallup in three waves (2000, 2005, and 2021) found that when owners were asked, the reasons they gave for owning guns shifted substantially even over the two decades. In 2000, 65% of gun owners surveyed claimed to own guns “for protection”; by 2021, 88% claimed to own guns for the same reason (Gallup 2021).

<sup>24</sup> Pfaffendorf, Davis, and Kinney’s recent study of mass shooter manifestos (2021) has discovered that gendered racism was a patterned claimed motivation in the dataset. Their work supports a larger finding that gendered racism among white men in the United States is consistently connected not just with mass shootings committed by white men (Bridges and Tober 2016; Bridges and Tober 2019) but also with gun ownership in the United States by white men more broadly (see Stroud 2012; Stroud 2016; Carlson 2015a; Carlson 2015b; Carlson 2020; Mencken and Froese 2019).

## Mass Shootings and Masculinity

*Show*, which depicted a family's life in a small white community of suburban single-family homes, and the safety and security associated with that community. Carlson has argued that Mayberry represents a symbolic image of what is perceived as "lost" among the gun-owning American men she studied. The men in Carlson's study were living through the evaporation of the manufacturing economy that may have afforded previous generations of men like them an ability to accomplish masculinity through economic provision but no longer offered them the same economic security. Carlson found that some white men used guns to symbolically and emotionally negotiate this social, cultural, and economic transition. Less able to accomplish masculinity through the "provider" role, Carlson found gun-owning American men increasingly leaning on "protection" as a way of accomplishing masculinity—white men in particular (see also Stroud 2012; Stroud 2016).

Yamame (2017) has argued that Gun Culture 2.0 is uniquely American, emerging alongside early victories by the civil rights movement and shifts in understandings of inequality and privilege in America. Indeed, Madfis (2014) has shown that boys and young men who have committed school shootings disproportionately belong to privileged groups in society: young, white, heterosexual, class- and education-privileged.<sup>25</sup> Madfis (2014) has argued that different forms of privilege and entitlement on the basis of gender, race, class, and sexuality converge in many instances of mass murder, noting, for instance, that while homicides in the United States are committed by men more than women, mass murders are the only category of US homicides disproportionately committed by white, heterosexual men. Gun Culture 2.0 emerged right around the same time that the intersecting privileges associated with these identity categories started to

---

<sup>25</sup> While similar data for mass shootings in Canada is difficult to come by, Tonso (2009) has summarized a collection of seventeen school shooting incidents between 1966 and 2008 collected by the Canadian Broadcast Corporation (six of which occurred in Canada). Mass shooters in Canada, from these data, are similar to US mass shooters on demographic characteristics: they were all young, white men.

become more visible and more contested. As sociologist Raewyn Connell has written, these shifts have produced “a major loss of legitimacy for patriarchy,” and “different groups of men are now navigating that loss in very different ways” (Connell 1995: 202). Karen Tonso (2009) too has argued that many young men in the United States experience a sense of shame and humiliation that stems in part from their perceived loss of privilege. Similarly, as Mencken and Froese have written, “white men in economic distress find comfort in guns as a means to reestablish a sense of individual power and moral certitude in the face of changing times” (2019: 22).

Gun culture in the United States, as well as in other nations, shifts over time, and understanding this fact is important in making sense of mass shootings. For instance, as detailed above, mass shootings are more prevalent in the United States than in other nations and have increased in frequency over time. There are potentially varied drivers of these trends, including the greater availability of certain kinds of guns and the relative lack of restrictions for obtaining firearms in and throughout the United States in comparison to other nations with high rates of guns per capita. But a sociocultural exploration of why American men commit mass shootings more than any other group suggests that guns are a necessary but insufficient explanation for rates of mass shootings. It isn’t simply guns or simply masculinity. Explaining the relationship between American men, masculinity, and mass shootings requires an understanding of US gun culture. And this same attention is necessary when examining mass shootings in other nations as well.

## **V. Conclusion**

The scale and scope of mass shootings as a social problem are unique to the United States. But as the events that led to the present Commission illustrate, such incidents impact societies

## Mass Shootings and Masculinity

elsewhere. Research shows that rates of gun ownership and access to firearms contribute to the rate of mass shootings. But a large body of research has also suggested that attention must be paid not only to the guns involved but also to the people wielding the guns and, further, to the gun cultures within which mass shootings occur. Gender and social/national contexts are important components of our understanding.

National and international efforts to create larger datasets with methodologically defensible parameters will thus give us more data to better understand mass shootings. The database of “active shooter” incidents collected by the FBI in the United States is an important step in this direction. A more inclusive definition of “mass shootings” will enable us to examine a much larger number of incidents, and with that number comes an ability to identify patterns that are less visible with the small samples typically used in research on mass shootings. Nations should actively invest in producing publicly available data on mass shootings that occur within their borders. Suitably inclusive definitions might also enable an examination of where mass shootings occur within specific nations, as well as where they do not, in order to more systematically identify where and how gun cultures vary by context, even within societies, in ways that better explain how gun cultures are related to the problem of mass shootings more broadly.

Policies hoping to address mass shootings must take gun legislation into account, but research suggests that this is insufficient. The preponderance of research on mass shootings has shown that they are productively understood as enactments of masculinity. But guns and masculinity must first be recognized as fundamentally connected with each other, as are masculinity and violence. The research canvassed in this report suggests that men who are otherwise unable to access a gendered sense of status in their social hierarchies may turn to guns

or other forms of violence as masculine resources in societies in which guns or violence are culturally associated with or understood as “proof” of masculinity. Men enact masculinity in these ways in cultural contexts in which these enactments are culturally legitimized and granted status and authority. In such a context, real change will require *cultural* change as well, and this is much more challenging.

### ABOUT THE AUTHOR

Dr. R. Blake Brown is Professor of History and Chair of the Department of History at Saint Mary's University. He is also an adjunct professor at the Schulich School of Law at Dalhousie University and a Member of the College of New Scholars of the Royal Society of Canada. Dr. Brown completed a BA (Hon.) in History at Acadia University; MA in History at York University; MA in Criminology at the University of Toronto; LLB at the University of Toronto; and a PhD in History at Dalhousie University. His main field of research is Canadian legal history. He has authored or co-authored three books with the University of Toronto Press and the Osgoode Society for Canadian Legal History: *Arming and Disarming: A History of Gun Control in Canada* (2012), *A Trying Question: The Jury in Nineteenth-Century Canada* (2009), and *A History of Law in Canada, Volume 1: Beginnings to 1866* (2018). His scholarly articles have appeared in a number of leading history, law, and law and society journals, including the *Canadian Historical Review*, *Journal of Canadian Historical Association*, *Canadian Journal of Law & Society*, *Law & Social Inquiry*, *American Journal of Legal History*, *Dalhousie Law Journal*, *McGill Law Journal*, and *Osgoode Hall Law Journal*. Dr. Brown is a frequent media commentator on the history of gun control and has published articles addressing firearms policy in outlets such as the *Globe and Mail*, *Toronto Star*, *Policy Options*, *Vancouver Sun*, *The Province*, *Chronicle Herald*, and *Ottawa Citizen*.

## I. INTRODUCTION

This report provides a legal history of firearm regulation to help understand the current debate over gun control policy in Canada, particularly regarding semi-automatic firearms. Debate over the regulation of such guns has been particularly heated since 1 May 2020, when Prime Minister Justin Trudeau announced that the federal cabinet had issued an Order in Council (PC 2020-298) to ban several models of semi-automatic firearms.<sup>1</sup> This report describes some of the key technological developments in handguns and long guns that have spurred debates about the kinds of firearms that should be available for certain uses in Canada. It identifies weapons employed in mass casualty events in Canada with reference to specific examples and notes the policy response to those events. The report explains the legislative tools used to address the dangers associated with semi-automatic firearms and considers the public policy debates about these regulatory approaches. It also identifies the strengths and shortcomings of past legislative approaches and considers policy options concerning the availability of semi-automatic weapons.

This report demonstrates that the federal government has used a somewhat piecemeal approach to regulating handguns and semi-automatic firearms. Governments have historically sought to balance public safety and the interests of gun collectors, hunters, and target shooters. Efforts to limit the availability of some kinds of firearms have often resulted from their use in domestic and international mass shootings. Changes in firearm technology have contributed to attempts to limit the ownership or use of firearms deemed especially dangerous. The federal government has prohibited some semi-automatic rifles, declared others to be restricted firearms,

## The History of Gun Control in Canada

and left others as non-restricted firearms. This has complicated the enforcement of Canada's gun laws. It has also permitted firearms with the capability to cause substantial harm to remain in circulation. Similarly, the federal government has prohibited some handguns but left many others available for purchase, thus contributing to the movement of firearms from the legal market to those wanting handguns for illegal purposes.

## II. FIREARM TECHNOLOGY

### 1. Long Guns

Changing firearm technology has been an important factor in the history of gun control in Canada. At the beginning of the nineteenth century, long guns were generally single-shot, smooth-bore firearms loaded through the muzzle, which were slow to load, inaccurate beyond approximately 100 metres, and often misfired. More accurate rifled firearms had long existed but tended to build up residue that fouled the barrel, until the introduction of new conical ammunition that expanded upon being fired. In the mid- to late nineteenth century, breech-loading guns replaced muzzle-loaded weapons. These technological developments made long guns more dependable, faster to load, and more accurate at longer ranges.

Gun manufacturers in the nineteenth century also developed firearms with internal **magazines** that could hold several rounds of ammunition. Typically, these guns used a manual-action system (often "lever-action" or "bolt-action" designs) to load fresh cartridges into the chamber of the barrel. This manual process for putting a new round in the chamber limited the speed with which such guns could be fired (although the rate at which such guns could be fired was much faster than the weapons that preceded them). Lever-action repeating rifles, like the Winchester Model 1873 (see **Figure 1**) contained internal magazines that had a loading gate on the side of the frame that allowed shooters to reload the rifle by individually inserting new

## The History of Gun Control in Canada

cartridges until the magazine was full. Most Canadian hunters and target shooters long used, and still use, lever-action or bolt-action rifles.<sup>2</sup>

*Figure 1: Winchester 1873 Rifle*

Source: Wikipedia Commons, [https://en.wikipedia.org/wiki/Winchester\\_rifle#/media/File:Winchester\\_1873\\_Rifle.jpg](https://en.wikipedia.org/wiki/Winchester_rifle#/media/File:Winchester_1873_Rifle.jpg)

**Semi-automatic** rifles were a major technological innovation in firearm design. Such rifles automatically reload a cartridge into the chamber after discharge. Each pull of the trigger discharges a single round from a semi-automatic firearm. In comparison, an **automatic** firearm will shoot continuously so long as the trigger is depressed (until the weapon runs out of ammunition). Gunmakers began to develop the first semi-automatic rifles in the late nineteenth century.<sup>3</sup>

<sup>2</sup> Nineteenth-century industrialization allowed the firearms industry to produce huge numbers of weapons in its factories. Gun manufacturers developed retailing networks throughout North America and sought to expand the market for firearms beyond people who needed them for practical purposes like protecting livestock from predators or subsistence hunting. Historian Pamela Haag has examined the development of industrial firearms production in the United States and the business techniques used to broaden the market for guns. Haag has shown that low demand meant that gun makers had to develop markets: “From the gun industrialist’s perspective, supply creates the need for demand: volume production required volume consumption.” This meant targeting different segments of the market and creating a desire for guns among people whose livelihood did not depend on them. Pamela Haag, *The Gunning of America: Business and the Making of American Gun Culture* (New York: Basic Books, 2016) xiv. ## The History of Gun Control in Canada

Most militaries employed bolt-action rifle designs well into the twentieth century. For example, the Canadian military used bolt-action firearms as its standard infantry rifle in the First World War (the Ross rifle and Lee-Enfield rifle), Second World War (Lee-Enfield rifle), and the Korean War (Lee-Enfield rifle). From the mid-1950s to the mid-1980s, the Canadian military issued a semi-automatic rifle, the C1A1 (a Canadian version of the Belgium designed FN FAL), as its standard infantry weapon. Canada did not adopt a standard infantry rifle that had the ability to fire in single-fire, semi-automatic fire, or fully automatic modes until the mid-1980s, when it adopted the C7.<sup>4</sup> The ability to adjust a firearm to fire in different modes, including automatic fire, is commonly referred to as a “**select fire**” capability.

Some Canadian hunters began using semi-automatic rifles after World War II, as reflected in advertisements of major retailers that sold firearms to hunters. Retailers such as Eaton’s, the Hudson’s Bay Company, Sears, and Simpson’s advertised mostly manual-action firearms into the 1970s and 1980s (and such guns remain popular today).<sup>5</sup> By the 1960s, these retailers sold some small-calibre (“.22 calibre”) semi-automatic rifles that fired **rim-fire ammunition**. Rim-fire cartridges are limited to low pressures because they require a thin case so that the firing pin can crush the rim and ignite the primer. Rim-fire ammunition was inexpensive,

## The History of Gun Control in Canada

and thus .22 calibre semi-automatic rifles were popular among hunters shooting at small game or for killing animals that farmers deemed pests, such as gophers.

In comparison (see **Figure 2**), few semi-automatic hunting rifles firing “**centre-fire**” **ammunition** appeared in the advertisements of major retailers before the 1970s. A centre-fire cartridge has a primer located in the centre of the cartridge case head. Centre-fire cartridges can withstand higher pressures, allowing them to give a bullet greater velocity and energy. Common centre-fire cartridges include the .223 Remington and .308 Winchester. In the 1960s and 1970s some mainstream retailers offered for sale a modest number of semi-automatic centre-fire rifles. These guns tended to use small magazines (such as the Remington Model 740 or the Winchester Model 100 .308, each of which had a four-round magazine). They were often more expensive than bolt- or lever-action designs.

## The History of Gun Control in Canada

In the 1970s, semi-automatic, centre-fire rifles that accepted large-capacity magazines and were often based on military designs, such as the AR-15 (see **Figure 3**), began to enter the Canadian civilian market. Such firearms were produced without a “select-fire” capability, so they could not fire in a fully automatic mode. These “**assault-style**” firearms could be reloaded much faster than rifles like the Winchester repeating rifle.<sup>6</sup> They typically accepted large-capacity magazines and could be quickly reloaded by removing an empty magazine and inserting a loaded one. Writing in the mid-1970s, the author of *Modern Firearms* described the production and marketing of such guns: “Basically these are guns derived from existing assault rifles, called different names, and modified in such a way that they are only semi-automatic.”<sup>7</sup>

Figure 3: “What Makes a Typical AR-15?”

## The History of Gun Control in Canada

*Figure 4: Models of Ruger Mini-14s*

Source: "Ruger Announces New Mini-14 Tactical Models," Guns.com, 6 October 2019, <https://www.guns.com/news/2019/10/07/ruger-announces-new-mini-14-tactical-models> (accessed 22 March 2022).

*i) A Note on Terminology: Assault-style Firearms*

Today, there is substantial debate about what to call these firearms. My research suggests that in advertising semi-automatic, centre-fire rifles with large-capacity magazines in the 1970s and 1980s, Canadian retailers and gun owners often referred to firearms such as the AR-15, Mini-14 (see **Figure 4**), and FN-FAL as "assault rifles." This indicates a widely held though colloquial understanding that an assault rifle was a semi-automatic, centre-fire firearm capable of receiving a large-capacity magazine that was often a civilian version of a gun originally designed for military service. A few examples of gun owners and businesses referring to "assault rifles" in their advertisements illustrate the use of the term "assault rifle" by the Canadian gun community. In the *Calgary Herald* in 1976, a seller offered an "AR-15 semi-automatic assault rifle."<sup>8</sup> In 1978, the *Montreal Gazette* published an advertisement for a FN-FAL semi-automatic "assault

<sup>8</sup> *Calgary Herald*, 5 January 1976, 44.

## The History of Gun Control in Canada

rifle.”<sup>9</sup> In 1982, an Edmonton company, MilArm, advertised “assault rifles,” including AR-15s and Ruger Mini-14s.<sup>10</sup> Klondike Arms & Antiques of Edmonton sold the “Colt AR-15 Semi Auto Assault rifle” in 1983.<sup>11</sup> The *Montreal Gazette* ran an advertisement for an “AR-15A2 semi-automatic assault rifle” in 1985.<sup>12</sup> In 1986, the Firing Line Ltd Shooting Range Gun Store in Calgary sold “assault rifles,” including the AR-15 and Mini-14 (see **Figure 5**).<sup>13</sup> Kingsway Firearms of Vancouver sold “assault rifles” such as the AR-15 in 1987 (see **Figure 6**).<sup>14</sup> By contrast, firearm owners and retailers did not describe shotguns or bolt- or lever-action hunting guns as “assault rifles.”<sup>15</sup>

*Figure 5: Firing Line Ltd. Shooting Range Gun Store (Calgary) Advertisement for “Assault Rifles” (1986)*

## The History of Gun Control in Canada

*Figure 6: Kingsway Firearms (Vancouver) Advertisement (1987)*

Source: *Vancouver Sun*, 28 February 1987, H3.

However, by the early 1990s, the firearms community developed an aversion to calling any civilian firearm an “assault rifle” (or the synonym “assault weapon”). The gun community instead began to label such rifles “modern sporting rifles,” “black rifles,” or “tactical rifles.” This shift in terminology occurred soon after the murder of fourteen women at the École Polytechnique in 1989 by a man armed with a Ruger Mini-14, which was followed by the United States Congress passing an “assault weapons ban” in 1994 (discussed below). Professor Robert J. Spitzer of the State University of New York has described this shift in how the firearms industry described semi-automatic centre-fire rifles with large detachable magazines in the United States. He has concluded that gun manufacturers and retailers often referred to these rifles as “assault rifles” in the 1980s and marketed them by highlighting the military lineage of the guns’ designs. However, by the early 1990s, “both the gun industry and National Rifle Association abruptly changed course in their reference to such weapons as pressure built on Congress and in some

## The History of Gun Control in Canada

states to enact curbs.”<sup>16</sup> This led to the “remarketing and rebranding of such weapons as no different from typical, traditional hunting weapons that also fired in semi-automatic fashion. That effort has persisted to the present, with terms like “tactical rifles” and “modern sporting rifles” typically offered by gun organizations, including the National Rifle Association (NRA) and National Shooting Sports Foundation (NSSF), as preferred terms for such weapons.”<sup>17</sup> A similar effort to rebrand civilian “assault rifles” as “modern sporting rifles” also occurred in Canada.

For the purposes of this report, I use the term “assault-style rifle” to refer to semi-automatic, centre-fire rifles that can receive a detachable magazine and that often originated from a military design. In the debates about gun control in Canada, however, these firearms have at various times been referred to as “paramilitary” rifles, “military-style” rifles, “modern sporting rifles,” “black rifles,” “assault weapons,” and “assault rifles.”<sup>18</sup>

Critics of limitations on the use or ownership of assault-style firearms frequently claim that these guns are regulated simply because they have a supposedly threatening appearance. For example, a 2016 petition submitted to Parliament demanded that the classification of the AR-15 rifle be lowered from restricted to non-restricted. The petitioners asserted that the AR-15 had been “restricted purely because of [the] cosmetic appearance of the rifle which does not make the rifle more dangerous.”<sup>19</sup> However, American writer Tom Diaz has emphasized that the look of

<sup>16</sup> Robert J. Spitzer, *Guns Across America: Reconciling Gun Rules and Rights* (New York: Oxford University Press, 2015), 81.

<sup>17</sup> *Ibid.*

<sup>18</sup> For example, in 2013 the current CEO of the Canadian Coalition for Firearm Rights, Rod Giltaca, uploaded a YouTube video in which he described the evolution of his interest in firearms. He noted that he had developed a strong interest in “military-style” firearms. “Canadian Gun Culture 101, Episode 1: How I Met the Firearm” (at 8:40), YouTube, uploaded by Civil Advantage, 27 Mar 2013, <https://www.youtube.com/watch?v=qDw1NeW9XU4&t=542s> (accessed 3 May 2021).

<sup>19</sup> Petition to the Minister of Public Safety and Emergency Preparedness, e-111 (Firearms), Presented to House of Commons, 13 May 2016 (Petition No. 421-00292), <https://petitions.ourcommons.ca/en/Petition/Details?Petition=e-111> (accessed 22 February 2022). Also see Matt DeMille, “What Firearms are Reasonable and Proportionate for

## The History of Gun Control in Canada

assault-style rifles is not cosmetic but is rather designed to ensure that the person wielding the firearm can discharge it quickly and accurately:

The assault weapon’s physical appearance is the result of design following function. All assault weapons—military and civilian alike—incorporate specific features that were designed to provide a specific combat function. That function is laying down a high volume of fire over a wide killing zone, also known as “hosing down” an area. Civilian assault weapons keep the specific design features that make this deadly spray-firing easy.<sup>20</sup>

After the 1994 American assault weapons ban expired in 2004, gun makers identified assault-style rifles as a growth market. While many hunters continued to use manual-action firearms, gun manufacturers and retailers marketed semi-automatic rifles often derived from military weapons designs.<sup>21</sup>

The precise number of assault-style firearms in Canada is unknown because many such guns are classified as non-restricted firearms and thus are not registered. Estimates differ of the number of assault-style firearms prohibited by the 1 May 2020 Order in Council. In 2021, the RCMP estimated that roughly 150,000 firearms were affected.<sup>22</sup> A gun industry lobby group, the Canadian Sporting Arms and Ammunition Association (CSAAA), in comparison, pegged the number of newly prohibited firearms at 518,000.<sup>23</sup> Regardless of which estimate is correct, the number of firearms prohibited in 2020 represents a fraction of the total number of guns owned by civilians in Canada and, as discussed below, is only a portion of the number of semi-automatic

## The History of Gun Control in Canada

centre-fire rifles in circulation. Estimates of the number of firearms in private hands in Canada vary widely. The federal Department of Justice website includes an estimate that there are approximately seven million privately-owned firearms in Canada, while the international Small Arms Survey estimated the total number of civilian-held legal and illicit firearms in Canada in 2017 at 12,700,000.<sup>24</sup>

## 2. Handguns

**Handguns**, like long guns, have undergone a technological transformation since the early nineteenth century. At the beginning of that century, most handguns were muzzle-loaded weapons. Samuel Colt began producing a pistol designed with multiple rounds of ammunition held in a revolving cylinder. This became the basic design for other “revolvers,” with several companies producing such guns by the 1860s.<sup>25</sup>

Additional technological innovations improved the rate of fire of handguns, increased the speed with which such guns could be reloaded, and allowed for handguns to be loaded with more rounds of ammunition. Early revolvers generally used a “single-action” mechanism. This meant that the user of the firearm had to manually pull back the hammer of the revolver. This cocked the hammer so that pressing the trigger made the hammer strike the primer of the ammunition. Cocking also rotated the cylinder of the revolver so that a new round was moved into position to fire. By the late-nineteenth century, “double-action” revolvers became widely available (see

Carman, *A History of Firearms, from Earliest Times to 1914* (London: Routledge, 1955).

## The History of Gun Control in Canada

**Figure 7).** Revolvers with this action automatically rotated the cylinder, cocked the hammer, and fired by just pulling the trigger. Double-action revolvers had a higher rate of fire than single-action pistols.

*Figure 7: British Bull Dog Revolver (c. 1889), a “double-action” revolver*

Source: *Stark's Catalogue*, Charles Stark Co. (Toronto, c.1889) 237.

All revolvers were limited in their potential lethality by the number of rounds that their cylinders could hold (often between five and seven). Revolvers tended to be slow to load. Initial designs required the user of the firearm to remove the spent shell casings from each chamber in the revolver's cylinder and then manually and individually insert new ammunition into each chamber. Gun manufacturers looked for ways to increase the speed with which such guns could be reloaded. For example, some developed revolvers that had hinges that allowed for users to expose the chambers of the cylinders and thus more quickly reload (so-called “top-break” revolvers). Other manufacturers employed swing-out cylinders with “extractors” that allowed all shell casings to be removed quickly.

## The History of Gun Control in Canada

The development of semi-automatic handguns in the late nineteenth century would eventually prove significant, as they substantially increased the rate of fire of handguns, allowed handguns to carry more ammunition, and made them faster to reload. These handguns generally employed some of the key features of double-action revolvers, including that depressing the trigger both fired the weapon and loaded a new round into the gun's chamber. Unlike revolvers, which contained ammunition in cylinders that made them slow to load, semi-automatic handguns generally held ammunition in a magazine inserted into the handle of the weapon. (See **Figure 8**.) Once an operator discharged all the ammunition in the magazine, the operator could quickly remove the empty magazine and replace it with a full one.

*Figure 8: United States Pistol, Caliber .45, M1911*

Source: Wikipedia commons, [https://en.wikipedia.org/wiki/M1911\\_pistol#/media/File:M1911A1.png](https://en.wikipedia.org/wiki/M1911_pistol#/media/File:M1911A1.png) (accessed 20 December 2021).

Inexpensive, mass-produced revolvers entered the Canadian market in large numbers in the last third of the nineteenth century. By the late 1880s, consumers could purchase revolvers for as little as one to two dollars. There were initially no legal limits on who could buy a handgun and few limits on when they could be carried. This led to a spike in concerns about the

## The History of Gun Control in Canada

availability of handguns in Canada. Critics of easy access to handguns said that they led to criminal activity and shooting accidents.<sup>26</sup> Politicians and newspaper editors warned about the inherent dangers of revolvers, noting that they were easily concealed and allowed a shooter to quickly discharge several rounds of ammunition. Concern about handguns continued into the twentieth century. Various newspapers published appeals for strictly regulating or even banning pistols. Some commentators, fuelled by anti-immigrant sentiments, warned that certain ethnic groups tended to carry pistols. Heightened worries about crime during the Depression and the practice of some soldiers to bring guns home as war souvenirs also created concerns.

High-profile shootings involving handguns have sparked appeals to prohibit such firearms. In 1992, a professor at Concordia University used handguns to kill four employees of the university. This resulted in a petition that garnered over 200,000 signatures demanding that handguns be prohibited.<sup>27</sup> In 2005, a shooting on Yonge Street in Toronto resulted in the death of fifteen-year-old Jane Creba. Several bystanders were also wounded in the incident.<sup>28</sup> The shooting added fuel to the debate over the civilian ownership of handguns, which was already part of the ongoing federal election because Prime Minister Paul Martin had promised to ban

handguns.<sup>29</sup> In July 2018, a shooter armed with an illegal handgun killed two people and injured thirteen others in the Toronto Danforth area. The incident contributed to the creation of two new gun control organizations, the Danforth Families for Safe Communities and Doctors for Protection from Guns, both of which urged a national handgun ban.<sup>30</sup>

### III. LEGAL USES OF ASSAULT-STYLE RIFLES

As noted earlier, some semi-automatic centre-fire rifles have been sold in Canada for decades, but historic sporting literature and advertisements suggest that the majority of hunters and target shooters traditionally used manual-action firearms (with the exception of semi-automatic .22 calibre rifles firing low-powered rim-fire ammunition, which seem to have become relatively common by the 1960s).

Most target shooters also traditionally did not use assault-style rifles. Target shooting has old roots in Canada.<sup>31</sup> Rifled firearms developed in the mid-nineteenth century allowed for participants to aim at targets placed hundreds of meters away. Some military planners believed that a well-trained militia using rifles could effectively defend against a more numerous enemy. This was a popular idea in British North America given the recurring threat of United States

## The History of Gun Control in Canada

aggression. In the 1860s, rifle shooting competitions became common throughout much of what became Canada. Colonial governments, and then the Canadian government after Confederation, supported rifle shooting by providing infrastructure, rifles, financial support to pay for ammunition and transportation, and prizes. The Dominion of Canada Rifle Association, formed in 1868, was an outgrowth of this desire to encourage men to shoot to help defend the nation.

The popularity of rifle shooting waxed and waned over time, though Canadians have often participated in local, provincial, and international shooting events. In 1907, the International Shooting Union formed, becoming the world governing body for shooting. (The organization changed its name to the International Shooting Sport Federation (ISSF) in 1998.) Shooting also became part of the modern Olympics games in 1896. The number of Olympic shooting events has varied over the years. In the early Olympic games, for example, there were events for army rifles and military service pistols. In recent Olympics, however, events have been limited to pistol competitions, small-bore rifle, air rifle, trapshooting, and skeet shooting. The rifle shooting competition at the Olympics uses .22 calibre rim-fire ammunition and requires participants to fire at relatively short distances (a maximum of 50 meters).<sup>32</sup> The Olympics does not include competitions that require the use of assault-style rifles.

Many shooting competitions use small-calibre rim-fire ammunition because it has a low recoil. For example, the Canadian Shooting Sports Association lists several rifle-shooting disciplines on its webpage.<sup>33</sup> Most events do not use semi-automatic, centre-fire rifles. Other shooting associations hold events using various models of rifles. For example, the Ontario Rifle

## The History of Gun Control in Canada

Association advertises several rifle-shooting events. Some of these events allow the use of assault-style rifles, though this does not seem to be a requirement to participate in most events.<sup>34</sup>

Shooting competitions that require the use of assault-style rifles, such as “multi-gun” (or “3-Gun”) competitions, are of relatively recent lineage. 3-Gun requires shooters to use three firearms (a handgun, a semi-automatic rifle, and a shotgun). The event replicates battlefield conditions by requiring competitors to aim and fire at targets placed at relatively short distances while moving through a course in as little time as possible. Participants use firearms available to average gun owners rather than the specialized rifles of Olympic shooters, and speed is valued as highly as accuracy. The roots of these multi-gun competitions can be traced to matches first organized by the American *Soldier of Fortune* magazine at its annual convention in 1980, which simulated combat with pistols, semi-automatic rifles, and shotguns. Participants in the 1980 event used models of semi-automatic rifles such as the Heckler & Koch 91. *Soldier of Fortune* held 3-Gun competitions at subsequent conventions, and shooting organizations throughout the United States began to host similar events.<sup>35</sup> Some Canadian gun clubs experimented with 3-Gun in the 1980s, but the activity did not substantially grow in popularity until around 2000. In 2012, the *Edmonton Journal* reported that about three hundred Albertans regularly competed in 3-Gun.<sup>36</sup> PC 2020-298 prohibited some assault-style rifles used in multi-gun competitions, though

## The History of Gun Control in Canada

other non-restricted and restricted semi-automatic rifles that can be used in such events remain on the market.

### IV. CRIMINAL USES OF ASSAULT-STYLE RIFLES

Assault-style firearms have been employed in criminal activity in Canada. Press stories and reported legal cases indicate that individuals involved in the illegal drug trade are sometimes found to possess assault-style firearms. Shooters have also used semi-automatic rifles in several mass shootings, hostage takings, bank robberies, and police killings in Canada.<sup>37</sup> Some of the criminal incidents involving semi-automatic rifles in Canada are well-known; others have largely been forgotten. Here is a sample of some incidents in Canadian history:

- **1962:** During a bank robbery in Montreal, three men armed with semi-automatic rifles, including a FN rifle, killed two police officers.<sup>38</sup> (The FN rifle was made a prohibited firearm in Canada in 1992.)
- **1967:** Arthur Towell, 35, armed himself with a Beretta BM 59 semi-automatic rifle and began firing at people from his parents' home in Vancouver. Towell killed two people in their backyard, shot another person across the street, and shot a fourth person walking on the street.<sup>39</sup> (The Beretta BM 59 was made a prohibited firearm in 1995.)

<sup>37</sup> Semi-automatic firearms are frequently the weapons used to mass shooting events in the United States. ## The History of Gun Control in Canada

Internationally, assault-style rifles have also been involved in many mass shootings—too many to list here. Some of the most recent mass shootings involving such firearms in the United States include:<sup>58</sup>

- **2012:** Sandy Hook Elementary School shooting, Connecticut (27 fatalities). Shooter possessed an AR-15-type rifle.
- **2012:** Aurora theatre shooting, Colorado (twelve fatalities). Shooter possessed an AR-15-type rifle.
- **2015:** San Bernardino shooting, California (fourteen fatalities). Shooters possessed AR-15-type rifles.
- **2016:** Orlando Nightclub shooting, Florida (49 fatalities). Shooter possessed a Sig Sauer MCX semi-automatic rifle.
- **2017:** Las Vegas music festival shooting, Nevada (58 fatalities). Shooter possessed 24 firearms, including AR-15-type rifles and AR-10-type rifles.
- **2017:** Sutherland Springs First Baptist Church shooting, Texas (26 fatalities). Shooter had an AR-15-type rifle.
- **2018:** Marjory Stoneman Douglas High School shooting, Florida (seventeen fatalities). Shooter possessed an AR-15-type rifle.
- **2018:** Pittsburgh synagogue shooting, Pennsylvania (eleven fatalities). Shooter possessed an AR-15-type rifle.
- **2019:** El Paso Walmart shooting, Texas (23 fatalities). Shooter used an AK-47-type rifle.
- **2019:** Dayton entertainment district shooting, Ohio (nine fatalities). Shooter possessed an AR-15-type weapon.
- **2021:** Boulder, Colorado shooting at a King Soopers supermarket (ten fatalities). Shooter was armed with a Ruger AR-556 pistol (an AR-15-type weapon).
- **2021:** Indianapolis FedEx shooting, Indiana (nine fatalities). Shooter was armed with a Ruger AR-556 pistol (an AR-15-type weapon) and a HM Defense HM15F semi-automatic rifle.

<sup>58</sup> Details on the mass shooting incidents in the United States come from Mark Follman, Gavin Aronsen, and Deanna Pan, “US Mass Shootings, 1982–2021: Data From Mother Jones’ Investigation,” *Mother Jones*, updated 30 November 2021, <https://www.motherjones.com/politics/2012/12/mass-shootings-mother-jones-full-data/> (accessed 11 January 2022).

## The History of Gun Control in Canada

Mass shootings using semi-automatic rifles have also occurred in other developed nations, though with less frequency than in the United States. Some of the most notable include:

- **1987:** Hungerford school shooting, England (sixteen fatalities). Shooter possessed Norinco Type 56S and M1 semi-automatic rifles.
- **1990:** Aramoana shooting, New Zealand (thirteen fatalities). Shooter possessed several semi-automatic rifles, including .223-calibre Norinco Type 84s, a Norinco SKS semi-automatic rifle, and a .22-calibre Squires and Bingham Model 16 semi-automatic rifle.<sup>59</sup>
- **1996:** Port Arthur shooting, Australia (35 fatalities). Shooter possessed AR-15 and SKS rifles.<sup>60</sup>
- **2011:** 22 July shooting, Norway (67 fatalities). Shooter possessed a semi-automatic Ruger Mini-14 rifle.<sup>61</sup>
- **2019:** Christchurch mosque shooting, New Zealand (51 fatalities). Shooter possessed several firearms, including two semi-automatic rifles.<sup>62</sup>

## V. CONCERNS WITH SEMI-AUTOMATIC FIREARMS AND SUPPORT FOR GUN CONTROL

The presence of semi-automatic rifles often based on military designs in the Canadian consumer market began to spark concerns in the 1970s. In the early 1970s reports that the Front de libération du Québec (FLQ) had legally purchased semi-automatic rifles led to calls from several Parliamentarians that the federal government make it more difficult for civilians to acquire such weapons. In 1970, MP Warren Allmand told the House of Commons that the kidnappers of

## The History of Gun Control in Canada

Pierre Laporte “were able to go down to Notre Dame Street and obtain several machine guns and/or repeater rifles.” He thus asked if the government was “considering the introduction of further legislation regarding the control of guns, or tightening the administration of the present legislation?”<sup>63</sup> NDP MP Lorne Nystrom also asked in the House of Commons, “In view of recent activities of the FLQ and the increased sales of M-1 rifles in Montreal, will the Prime Minister inform the House whether the government is planning any amendments to the Criminal Code to make it more difficult to purchase fire arms?”<sup>64</sup> (The semi-automatic M-1 Garand rifle was the standard infantry weapon of the United States Army in the Second World War.) In 1971, a Quebec bank robber with a Commando Mark III semi-automatic rifle killed a police constable. The Commando Mark III was a semi-automatic version of the Thompson automatic rifle, which Allied forces used extensively in World War Two. Police urged that access to the Commando Mark III be limited.<sup>65</sup> In March 1973, Justice Minister Otto Lang indicated that the government might introduce a Criminal Code amendment to address the use of firearms like the M-1 semi-automatic rifle, as he noted concerns about “quasi-machine guns” and the “more exotic types of firearms.”<sup>66</sup> Some Canadians expressed apprehension about the introduction of the AR-15 into the civilian market. The *Windsor Star*, for instance, warned in 1975 that criminals “might very well show some interest in the high-powered AR-15.”<sup>67</sup> In 1976, a thirteen-year-old boy mail-

## The History of Gun Control in Canada

ordered an AR-15 from an Edmonton gun dealer. The incident drew attention to the availability of the AR-15 and led to calls for stronger gun controls.<sup>68</sup> One Alberta columnist asserted, “I don’t believe a weapon like the AR-15 should be allowed to be sold in Alberta—or Canada—to anyone, no matter what their age... We don’t need AR-15 rifles around any more than we need tanks for the people.”<sup>69</sup>

Some representatives of hunters’ organizations expressed concerns about the use of firearms like the AR-15. For example, in 1977, Jack O’Dette of the Ontario Federation of Anglers and Hunters complained about some hunters using M-1s and AR-15s. O’Dette contributed to conservation efforts for decades, serving as president of Canadian Wildlife Federation and the Ontario Federation of Anglers and Hunters, and was a strong proponent of hunting and an opponent of gun control. However, he said stopping the use of guns like the AR-15 would “do much to convince the anti-gun segment of the public that we are responsible and should be allowed to enjoy our sport as our forefathers did.”<sup>70</sup> O’Dette warned about the public relations problem caused by assault-style rifles, noting that “if press pictures show more and more unconventional guns, approaching military weapons in configuration and appearance, we are going to have continuous agitation [sic] to do away with firearms.” O’Dette noted that the public associated guns like the AR-15 with armed conflict and insurrections and said he believed that weapons such as the AR-15 “are police or security or military weapons.”<sup>71</sup> O’Dette’s comments highlight a traditional reluctance of some hunters to adopt assault-style rifles—a

## The History of Gun Control in Canada

reluctance that to some extent continues to exist. For example, in 2021, a former firearms and hunter safety training instructor, Don Pajot, suggested that “Canadian hunters should raise the bar and aim to support the ban on ‘assault-style firearms,’ which have no legitimacy in our hunting gear. We should speak out for our time-honoured traditions and legitimate firearms ownership, but also for the greater good and public safety.”<sup>72</sup>

In the early to mid-1970s, increasing crime rates sparked interest in strengthening Canada’s gun control regime. Advocates of stronger gun laws pointed to the substantial number of murders involving long guns and noted that Canada lacked a screening process for those wishing to purchase most firearms. In response, the federal government introduced and passed Bill C-51 in 1977, which required new purchasers to acquire a Firearms Acquisition Certificate (FAC). As discussed below, Bill C-51 also included efforts to limit access to and use of some assault-style firearms.

### 1. Responses to the Montreal Massacre

The 1989 Montreal Massacre created widespread public awareness of the dangers of semi-automatic assault-style firearms. Students of École Polytechnique helped to organize a petition demanding a ban on the civilian possession of “military or paramilitary weapons.” This petition garnered over 560,000 signatures.<sup>73</sup> In the aftermath of the École Polytechnique shooting, many federal politicians from all parties expressed concern about the availability of assault-style rifles.

<sup>72</sup> Don Pajot, “Where Hunters Should Aim in Discussing Bill C-21 on Gun Control,” *Ottawa Citizen*, 15 April 2021. ## The History of Gun Control in Canada

Progressive Conservative MP Jean-Pierre Blackburn stated in the House of Commons on 8 December 1989:

Fourteen young women, in the flower of their youth, killed by a maniac with a semi-automatic weapon. Why are weapons of this kind allowed in Canada? Why do we let people own such dangerous and destructive weapons? For recreation purposes? That doesn't make sense.<sup>74</sup>

Blackburn thus urged Parliament “to take action to ban the possession of such weapons in Canada.” In early 1990, Blackburn told the House of Commons that since the Montreal Massacre, “there [had] been a major movement across the country against the use of semi-automatic weapons. Thousands of Canadians are demanding changes in the existing legislation in order to limit the sale and possession of such weapons in Canada.”<sup>75</sup> Progressive Conservative MP Barbara Greene urged her party to “bring forward gun control legislation to prohibit the sale or possession of automatic or semi-automatic weapons with the exception of those required by police forces.”<sup>76</sup> Greene later told the House of Commons, “People throughout Canada do not want a proliferation of powerful weapons capable of firing bullets in rapid succession for extended periods of time.”<sup>77</sup> Progressive Conservative MP Pauline Browes noted that the Montreal Massacre had “focused public attention on the availability of guns in our society. For under \$500, a 16-year-old in Canada can buy an AK-47 assault rifle that has been converted from fully automatic to semi-automatic.”<sup>78</sup> Liberal MP Warren Allmand, a former Solicitor

## The History of Gun Control in Canada

General of Canada, reminded the Minister of Justice in April 1990 that “the gun that was used to kill those 14 women at the University of Montreal was a Ruger semi-automatic rifle, which could fire up to 50 rounds of ammunition and which is now used by several police SWAT squads and military forces.”<sup>79</sup>

Many newspapers across Canada advocated for the federal government to take steps to limit access to assault-style rifles after the Montreal Massacre. For example, the *Montreal Gazette* wrote:

What hunter really needs a rifle that can fire 30 rounds in four seconds? Why, in fact, should anyone outside of the military or police need such a weapon, or be allowed to own one.... These powerful semi-automatics should be added to the list of weapons—mainly handguns and automatic rifles—that can be purchased only by holders of a Restricted Weapons Registration Certificate.<sup>80</sup>

The *Calgary Herald* urged the federal government to consider “restrictions, if not an outright ban, on the type of weapon used in the Montreal shooting.”<sup>81</sup> In June 1990, the *Edmonton Journal* suggested that the federal government should prohibit all semi-automatic rifles, declaring that there was “no rational justification” for allowing people to possess semi-automatic rifles:

Let’s be brutally clear: if a deranged person goes on a rampage with a single-shot weapon, he may possibly be disarmed. If the killer has a semi-automatic weapon—as Montreal killer Marc Lepine had—the result is likely to be a massacre.... [S]emi-automatic weapons can serve no useful purpose in such sports as hunting.<sup>82</sup>

<sup>79</sup> Debates, House of Commons, 25 April 1990, p. 10652, [https://parl.canadiana.ca/view/oop.debat.es\\_HOC3402\\_08/604?r=0&s=1](https://parl.canadiana.ca/view/oop.debat.es_HOC3402_08/604?r=0&s=1).

<sup>80</sup> “Control the Guns,” *Montreal Gazette*, 9 December 1989, B2.

<sup>81</sup> “Ban Rapid-fire Guns,” *Calgary Herald*, 9 December 1989, A4.

<sup>82</sup> “Guns that Massacre,” *Edmonton Journal*, 27 June 1990, 14. In the years since the École Polytechnique shooting, some newspapers have periodically urged the federal government to limit access to semi-automatic rifles. For example, on the tenth anniversary of the Montreal Massacre, the *Montreal Gazette* declared, “Effective gun control will only come when more guns are put on the prohibited list. Semi-automatic weapons designed for military use have no place on the streets of a civilized society like Canada’s.” “Gun Law Needs Fine-tuning,” *Montreal Gazette*, 8 December 1999, B2.

## The History of Gun Control in Canada

At a 1990 meeting of the Federation of Canadian Municipalities, delegates unanimously approved a motion calling on the federal government to “take immediate action to forbid the sale, possession and use of military and paramilitary combat weapons in Canada with the exception of members of the Canadian Forces and law enforcement officers in the fulfillment of their duties.”<sup>83</sup> In 1994, the Canadian and Quebec teachers’ federations issued a joint statement demanding stronger gun controls, including a prohibition on the possession of semi-automatic firearms.<sup>84</sup>

## 2. Views of Canadian Police Organizations

The Canadian Association of Chiefs of Police (CACP) has passed resolutions since the 1970s calling for governments to limit access to potentially dangerous long guns, including automatic firearms and semi-automatic rifles.<sup>85</sup> In 1973, the CACP passed a resolution declaring that “automatic rifles and machine guns are dangerous.” The Association resolved to recommend to Parliament that such firearms should be made **prohibited devices** under the Criminal Code. The CACP also expressed concern with the availability of semi-automatic rifles in the mid-1970s: “Evidence has been brought forward on a good number of occasions that hold-up men, in particular those that are holding up banks and other financial institutions, are armed with semi-automatic or fully automatic rifles or machine guns.”<sup>86</sup> The CACP pointed to several especially

<sup>83</sup> Philip Authier, “Municipalities Support Montreal’s Demand for Combat-weapons Ban,” *Montreal Gazette*, 6 June 1990, A5.

<sup>84</sup> Richard Mackie, “Tighter Gun Laws Demanded,” *Globe and Mail*, 25 November 1994, A11.

<sup>85</sup> For summaries of the CACP resolutions concerning firearms, see Canadian Association of Chiefs of Police (CACP), “Resolutions Summaries,” updated 2003, [https://www.cacp.ca/status-report-government-responses.html?asst\\_id=538](https://www.cacp.ca/status-report-government-responses.html?asst_id=538) (accessed 22 March 2022), pp. 34–38. Copies of the CACP resolutions are available at the CACP head office. They are also in the possession of the author.

<sup>86</sup> Canadian Association of Chiefs of Police (CACP), “Supplementary Position Paper on Gun Control Laws, Prohibited and Restricted Weapons” (1974), 6.

## The History of Gun Control in Canada

concerning models of firearms, including the M-1 semi-automatic rifle: “this type of firearm is of no particular value to hunters.”<sup>87</sup> The CACP also expressed concern about the appearance of the semi-automatic version of the M16 rifle (i.e., the AR-15) in Canada:

The M16 fires a .223 calibre bullet, which is notorious for its easy deflection by brush or other obstruction. Nevertheless, it was adopted by the United States Army because of its characteristic of nosediving in flesh with subsequent massive shock and wounding. Additionally, the small cartridge allowed the carrying of many more rounds, desirable in the field. The easy bullet deflection prevents its realistic use as a short-range woods weapon of the eastern forests and the rifle’s basic construction prevents the affixing of a telescopic sight to allow its use as a plains or “varmint” rifle. This rifle has no place in the civilian world.<sup>88</sup>

In 1977, the CACP passed a resolution stating that “semi-automatic firearms are basically designed as an instrument of war” and have “no sporting use either in the cultural or recreational sense.” The association urged that all such guns be classified as restricted firearms, since naming only some models as restricted allowed for others to remain available. In 1986, the CACP passed another resolution, noting that there was a “worldwide surplus of automatic and semi-automatic weapons primarily designed for purposes of warfare now finding their way into the Canadian market place.” The proliferation of such guns (and handguns) led the association to urge the federal government to “take the steps necessary to end this increase in available weapons.”

In 1988 (shortly before the Montreal Massacre), the CACP expressed concern over the “alarming rate with which military weapons are being imported into Canada, particularly originally manufactured automatic weapons that have been modified to fire in a semi-automatic mode.” The CACP declared that “these weapons can be readily converted to fully automatic mode of fire.” The CACP thus requested that the federal government stop the importation of such guns and that the federal minister of justice “take immediate steps to amend the Criminal

---

<sup>87</sup> *Ibid.*, 9.

<sup>88</sup> *Ibid.*, 12.

## The History of Gun Control in Canada

Code banning the importation and possession of such weapons.” In 1994, the CACP declared that “military assault rifles are manufactured for the sole purpose of killing people in large numbers,” and said the minister of justice should “ban all military assault rifles except for law-enforcement and military purposes.”

Police organizations have offered mixed views about recent efforts to prohibit assault-style rifles. In September 2019, the Ontario Association of Chiefs of Police expressed its support for a “prohibition on all military-designed assault rifles.” The Association asserted that “these weapons have no place in our communities and should be reserved for use by Canada’s military and law enforcement.”<sup>89</sup> The Canadian Association of Chiefs of Police has not released an official policy position on the 1 May 2020 Order in Council. In a statement, the CACP indicated that it “supports improving safety for frontline police officers and the public” and appreciates “the federal government’s commitment to this issue.”<sup>90</sup> However, it planned to review the Order in Council and subsequent legislation. The new bargaining agent for RCMP members below the rank of Inspector, the National Police Federation, issued a position statement opposing the May 2020 Order in Council, in part because the Federation believed the program to collect newly prohibited firearms would draw on RCMP resources.<sup>91</sup>

## The History of Gun Control in Canada

**3. Public Opinion Polling**

Professionally conducted public opinion polls have historically shown high levels of support for strengthening gun control laws in Canada, as the following sample of polls illustrates:

- **1975:** Gallup found that 83 per cent of Canadians favoured the registration of all firearms.<sup>92</sup>
- **1977:** Gallup reported that 85 per cent of Canadians wanted to see a law that would require a person to acquire a police permit before buying a gun.<sup>93</sup>
- **1979:** Gallup reported that 66 per cent of Canadians wanted the law governing the purchase of firearms to be more restrictive. (28 per cent wanted existing gun laws retained, while 4 per cent wanted less restrictive firearm laws.)<sup>94</sup>
- **1982:** Gallup found that 70 per cent of Canadians wanted the law governing the purchase of firearms to be more restrictive. (24 per cent wanted existing gun laws retained, while 4 per cent wanted less restrictive firearm laws.)<sup>95</sup>
- **1989:** Angus Reid found that 72 per cent of Canadians agreed with the statement that “Canada’s gun laws should be changed to make it more difficult to purchase deadly weapons.” Twenty-six per cent disagreed with this statement, and only 2 per cent had no opinion.<sup>96</sup>
- **1991:** Gallup found that 79 per cent of Canadians favoured more restrictive gun laws. (17 per cent wanted to maintain the current law, 2 per cent wanted the law to be less restrictive, and 3 per cent had no opinion.)<sup>97</sup>
- **1991:** Angus Reid asked if Canada’s gun laws should be changed to make it more difficult to purchase weapons. 80 per cent agreed that Canada’s gun laws should be changed to make it more difficult to purchase firearms. 16 per cent disagreed, and 4 per cent were unsure.<sup>98</sup>

<sup>98</sup> Allan McRae, “Canadians Want Tougher Gun Laws: Poll,” *Montreal Gazette*, 30 January 1991, 6.

## The History of Gun Control in Canada

- **1994:** Angus Reid reported that 70 per cent of Canadians wanted tougher gun laws. (23 per cent wanted no change in the laws, 5 per cent wanted fewer restrictions, and 2 per cent did not know.)<sup>99</sup>

The only period in Canadian history since the 1970s when popular support for strengthening gun controls waned was when cost overruns bedevilled the long-gun registry. In 1995, the Liberals passed Bill C-68, which expanded the registration system to include all firearms and required existing owners of non-restricted guns (not just people wishing to acquire firearms) to apply for licenses. Polling initially suggested high rates of public support for the long-gun registry, though eventually the high cost of the program led some Canadians to see the registry as a fiscal issue rather than a public safety issue.<sup>100</sup> A 2004 poll showed that 52 per cent of Canadians favoured scrapping the registry, while only 43 wanted it retained.<sup>101</sup>

Strong popular support for strengthening gun control, however, is seen in recent polls:

- **2017:** Ekos found that 69 per cent of Canadian supported banning guns in urban areas.<sup>102</sup>
- **2019:** Leger found that 77 per cent of Canadians favoured stricter gun controls. 17 per cent were opposed to stricter gun laws, and 7 per cent did not know or refused to answer.<sup>103</sup>

## The History of Gun Control in Canada

- **2021:** Leger found that 66 per cent of Canadians favoured stricter gun controls. In comparison, 19 per cent said gun laws should stay the same, 10 per cent said gun laws should be less strict, and 5 per cent did not know or refused to answer.<sup>104</sup>

Moreover, several polls have shown substantial support for limiting access to or banning assault-style rifles:

- **1993:** Angus Reid found that 84 per cent of Canadians supported a ban on assault rifles and even 71 per of gun owners favoured a ban on such rifles.<sup>105</sup>
- **2006:** Leger and Ipsos Reid determined that 81 per cent of people in Quebec supported banning semi-automatic firearms, and 68 per cent of people in the rest of Canada supported such a ban. 59 per cent of gun owners in Quebec agreed that such guns should be banned, as did 44 per cent in the rest of Canada.<sup>106</sup>
- **2018:** Environics Research Group found that 81 per cent of Canadians supported the statement “Private ownership of semi-automatic assault weapons for recreational purposes should not be legal in Canada.”<sup>107</sup>
- **2019:** Angus Reid reported that 77 per cent of Canadians agreed that more needed to be done to limit access to assault weapons, and 75 per cent supported a complete ban on assault weapons. (55 per cent of current or former gun owners agreed that assault weapons should be banned.)<sup>108</sup>
- **2020:** Angus Reid reported that 78 per cent of Canadians supported a complete ban on civilian possession of assault weapons. (45 per cent of current gun owners and 70 per cent of former gun owners supported such a ban.)<sup>109</sup>

## The History of Gun Control in Canada

- **2020:** Ipsos determined that 82 per cent of Canadians supported the federal government’s ban on assault-style weapons.<sup>110</sup>

Several key points can be drawn from the above discussion. First, scientific public polling indicates that a strong majority of Canadians have long supported stricter gun controls, including steps that would reduce the availability of assault-style rifles. In fact, even a large percentage of gun owners agree that assault-style firearms should be prohibited. Second, some newspapers, police organizations, politicians, and municipalities have at various times urged the federal government to limit access to assault-style rifles.

Recently, several organizations, municipalities, and newspapers have renewed the effort to regulate assault-style firearms more strictly. In 2018, the Federal Ombudsman for Victims of Crime recommended “a total ban on handguns and assault rifles, in conjunction with a buyback program.”<sup>111</sup> In 2018, Montreal’s city council passed a motion asking Ottawa to prohibit all “private possession of assault rifles and handguns, except in the case of the Canadian Armed Forces, police forces and other authorities mandated to possess firearms.”<sup>112</sup> Some newspapers have also recently called for a ban on assault-style firearms. In 2019, the *Globe and Mail* urged the federal government to limit access to semi-automatic firearms: “At the very least, all of them should be classified as restricted weapons, regardless of bullet size or design heritage. But given the threat they pose, there’s a strong argument for banning them altogether.”<sup>113</sup> In 2019, the

## The History of Gun Control in Canada

*Toronto Star* lauded New Zealand for banning many semi-automatic rifles, saying “no civilian needs to possess military-grade assault rifles designed specifically to maximize an attacker’s death toll.”<sup>114</sup>

### VI. THE REGULATION OF FIREARMS

Gun control in Canada has a long history. In the pre-Confederation period, some colonies and local governments passed legislation or issued bylaws that regulated when and where firearms could be carried or used.<sup>115</sup> Federal politicians have historically sought to limit access to or regulate the use of firearms that are deemed particularly dangerous.

#### 1. The Regulation of Handguns

Concerns with handguns contributed to a series of legislative enactments to limit the ownership and use of such weapons and to institute registration systems. In 1877, the Liberals required that a person could carry a pistol only if he had a reasonable fear of assault or injury to himself, his family, or his property.<sup>116</sup> In 1892, the Conservatives required individuals to possess a “certificate of exemption” to carry a pistol unless the owner had cause to fear assault or injury. It also became an offence to sell a pistol to anyone under sixteen years of age. Businesses selling pistols had to keep records of the purchaser, the date of sale, and information on the gun.<sup>117</sup> In 1913, the Conservatives increased the potential penalty for carrying a handgun outside the home or place of business without a permit. The 1913 legislation replaced the “certificate of

exemption” system with a requirement that those wanting to carry *or buy* a handgun have a “Form 76” permit. A permit was now required to carry a handgun regardless of whether there was reasonable cause to fear an assault.<sup>118</sup>

Parliament passed several important changes to Canada’s gun control regime regarding handguns in the 1930s. Minister of Justice Hugh Guthrie said in 1933 that the federal government was taking action in response to the “many requests which have come from municipal bodies, boards of trade and various other societies throughout Canada, asking that more drastic legislation be passed in regard to the use or carrying of pistols and revolvers.”<sup>119</sup> In 1933, the Conservatives provided that handgun permits could be issued on the grounds that the owner needed to protect life or property, or if the pistol would be used at a shooting club. The punishment for carrying a handgun without a permit was also increased.<sup>120</sup> In 1934, the federal government passed a statute to establish a registration system for handguns. The 1934 legislation required the recording of the handgun owner’s name, address, and occupation, as well as details of the firearm, including the purposes of its proposed usage. However, these records were not centralized. Rather, the Commissioner of the RCMP or designated police departments made firearms registries and kept records.<sup>121</sup> In 1951, Parliament amended the Criminal Code to require the Commissioner of the RCMP to create and maintain a centralized registry system for handguns. Minister of Justice Stuart Garson emphasized that handguns were particularly dangerous firearms and thus needed to be regulated closely. He noted that the government was “dealing with instruments which are not only deadly weapons in themselves but which are used

in the great majority of the crimes of violence that take place throughout the country.” It was thus “very much in the interests of everyone that the strictest sort of provision be made regarding the registration of firearms generally.”<sup>122</sup> The 1951 act provided that a centralized registry was to keep a “record of every firearms registration certificate that is issued under the authority of this Act.”<sup>123</sup>

In 1969, Parliament passed an omnibus criminal law reform bill that included provisions related to the use and classification of firearms. The changes included the creation of a classification system for all firearms. Guns were classified as (1) “firearms” (today called “**non-restricted firearms**”); (2) “restricted weapons”; or (3) “prohibited weapons.” Handguns were classified as “restricted weapons,” as the 1969 legislation made restricted “any firearm designed, altered or intended to be aimed and fired by the action of one hand.”<sup>124</sup>

The federal government made some additional changes to the regulation of handguns in Bill C-51 (1977). Bill C-51 required all gun purchasers to have a Firearms Acquisition Certificate (FAC). It required a formal background check to acquire a FAC, and a registration certificate for a handgun could only be issued if the applicant had a FAC.<sup>125</sup> Bill C-51 also removed defence of property as a ground for possessing a handgun. It was possible to acquire a restricted weapons certificate if the handgun was required by the applicant to protect life, for use in connection with a lawful profession or occupation, or for use in target practice. *A bone fide*

## The History of Gun Control in Canada

gun collector could also get a registration certificate.<sup>126</sup> Justice Minister Ron Basford explained to the House of Commons why protection of property had been removed as a ground for permission to have a restricted weapon: “Police authorities across the country have said, and we believe, that protection of property with firearms is not a desirable thing. People trying to protect themselves and their property with sidearms are usually more of a menace to themselves than to an intruder.”<sup>127</sup>

Following the 1989 Montreal massacre, the Progressive Conservatives required purchasers to provide more background information and legislated safe storage and transportation guidelines in Bill C-17.<sup>128</sup> The Liberals later reclassified some handguns as prohibited weapons. Bill C-68 (1995) declared as prohibited any handgun that had a barrel equal to or less than 105 millimeters in length or that was designed or adapted to discharge a .25 or .32 calibre cartridge.<sup>129</sup> Parliament’s goal was to prohibit short-barreled handguns that were easily concealed. In introducing this measure, Minister of Justice Allan Rock asserted that the Government would ban the “further sale of most handguns because we have determined they have no legitimate sporting purpose.”<sup>130</sup> He later noted that the “category of handguns that this

<sup>126</sup> Ibid. The federal government has generally not provided statistics on the number of permits issued to carry handguns to protect life, but the literature suggests few such permits were issued. See Donna Lea Hawley, *Canadian Firearms Law* (Toronto: Butterworths, 1988) 27–29. In 1972, the *Ottawa Citizen* reported that “Only police officers, some security guards and a few private investigators receive permits to carry handguns on a regular basis.” “Should We Shoot ... for Better Gun Laws,” *Ottawa Citizen*, 27 May 1972, 45. Writing in 1992, David Kopel concluded that in Canada it was “virtually impossible for an ordinary citizen to obtain a permit to carry a loaded handgun for self-defense.” David B. ## The History of Gun Control in Canada

government proposes to ban is not broadly used in legitimate sporting activities. Instead, these small handguns we propose to ban are cheaply made, easily concealed and commonly used in crime. That is why we are banning them.”<sup>131</sup> He estimated that almost 60 per cent of the handguns registered in Canada fell within the new definition of **prohibited firearms**. The decision to prohibit firearms based on barrel length and calibre meant that firearms with barrels longer than 105 millimeters and that used cartridges other than .25 and .32 calibre remained available for purchase in Canada as restricted weapons.

These legislative steps have probably contributed to a smaller percentage of Canadians owning handguns than Americans. While the United States has just under nine times the population of Canada, it has over 100 times more handguns.<sup>132</sup>

### 2. The Regulation of Assault-Style Rifles

The roots of the federal government’s current approach to regulating long guns can be found in the late 1960s. As the below summary of key legislative provisions highlights, the federal government gradually made it easier for the Governor in Council to restrict or prohibit firearms

<sup>131</sup>Debates, House of Commons, 1 December 1994, p. 8549, [https://parl.canadiana.ca/view/oop.debates\\_HOC3501\\_07/475?r=0&s=1](https://parl.canadiana.ca/view/oop.debates_HOC3501_07/475?r=0&s=1).

<sup>132</sup> The exact number of handguns in circulation in Canada and the United States is uncertain. The most recent Commissioner of Firearms Report indicates that there are 1,057,418 restricted firearms in Canada. This figure includes both restricted handguns and restricted rifles, but unfortunately, the Commissioner of Firearms does not provide a breakdown of the kinds of weapons included in the restricted category. See Commissioner of Firearms, “2019 Report,” Royal Canadian Mounted Police (2020), <https://www.rcmp-grc.gc.ca/en/firearms/2019-commissioner-firearms-report> (accessed 22 March 2022). However, Deputy Commissioner of the RCMP Stephen White recently told the Standing Committee on Public Safety and National Security that “we have a total of approximately 1.1 million registered firearms, and 96.7% of them are handguns. Basically, approximately one million handguns are registered in Canada.” Minutes of Proceedings and Evidence, Standing Committee on Public Safety and National Security (1 February 2022), First Session of the Forty-Fourth Parliament, 11, <https://www.ourcommons.ca/Content/Committee/441/SECU/Evidence/EV11535431/SECUEV04-E.PDF> (accessed 23 February 2022). The number of handguns in the United States is more difficult to estimate. A 2012 study prepared for the Congressional Research Service estimated that by 2009 there were 114 million handguns in the United States. William J. Krouse, *Gun Control Legislation* (Washington, DC: United States Congressional Research Service, 2012), 8–9.

## The History of Gun Control in Canada

deemed dangerous and has used its authority to limit the availability to the public of many models of firearms, including many assault-style firearms.

*i. Criminal Law Amendment Act, 1968–69, SC 1969, c. 38*

As noted earlier, in 1969 Parliament created a classification system for all firearms. Guns were classified as (1) “firearms”; (2) “restricted weapons”; or (3) “prohibited weapons.” In addition to making all handguns restricted, the 1969 legislation classified as a restricted weapon any firearm that that was “capable of firing bullets in rapid succession during one pressure of the trigger” (i.e., automatic weapons) and any firearm that was less than 26 inches (660 millimeters) in length or that was designed to be fired when reduced to a length of less than 26 inches by folding or telescoping. The legislation also provided authority to the Governor in Council to place firearms in the restricted category. A **restricted firearm** was a “weapon of any kind, not being a shotgun or rifle of a kind commonly used in Canada for hunting or sporting purposes, that is declared by order of the Governor in Council to be a restricted weapon.”<sup>133</sup> In other words, the legislation made some firearms restricted weapons based on their physical characteristics, while also allowing Cabinet to declare other firearms to be restricted so long as they were not a shotgun or rifle of a kind commonly used in Canada for hunting or shooting purposes.

The 1969 legislation also allowed the Governor in Council to declare models of firearms to be prohibited. A prohibited weapon was a weapon “not being a restricted weapon or a shotgun or rifle of any kind commonly used in Canada for hunting or sporting purposes, that is declared by order of the Governor in Council to be a prohibited weapon.”<sup>134</sup> The 1969 legislation thus established the power of the Governor in Council to classify firearms not commonly used for

<sup>134</sup> Ibid.

## The History of Gun Control in Canada

hunting or sporting purposes as restricted or prohibited. In the early to mid-1970s, the federal government used this authority to classify firearms as restricted or prohibited sparingly.<sup>135</sup> For example, in 1974, the federal government issued an Order in Council making the Commando Mark III (a semi-automatic version of the Thompson 1927A-1, or “Tommy gun”) a restricted weapon (see **Figure 9**).<sup>136</sup> In 1976, the federal government declared the High Standard Model 10 Series “A” and the High Standard Model 10 Series “B” semi-automatic shotguns to be restricted weapons.<sup>137</sup>

## The History of Gun Control in Canada

*ii. Criminal Law Amendment Act, 1977, SC 1976–77, c. 53*

In 1977, the federal government addressed the introduction of assault-style rifles into the Canadian consumer market in a revision to the Criminal Code. The legislation retained the 1969 classification system for firearms but changed the definition of “restricted” and “prohibited” weapons. Justice Minister Ron Basford explained to Parliament that the changes were part of an effort to prevent dangerous users from acquiring firearms, to encourage responsible gun ownership, and to discourage the criminal use of firearms. One way this would be done was “by prohibiting certain particularly dangerous firearms which have no legitimate sporting purposes, and restricting others.”<sup>138</sup>

The “restricted weapon” definition retained the 1969 wording but added that the category included any firearm that was not prohibited that had a barrel of less than 18.5 inches (470 millimeters) and was capable of “discharging centre-fire ammunition in a semi-automatic manner.”<sup>139</sup> This did not restrict all semi-automatic firearms, just short-barrelled ones. Long-barrelled semi-automatic firearms remained non-restricted unless otherwise prescribed. Minister Basford made clear to the House of Commons that this provision was intended to make many assault-style firearms restricted:

The purpose of this provision is to restrict rapid-fire, concealable weapons. Obviously, a weapon with a short barrel is easily concealable under a raincoat or a trench coat if the stock has been sawed off. Police records indicate that a large number of short-barrelled guns are being used for criminal purposes. The M1 was developed during the Second World War as a personnel stopper. The AR-15 was designed and produced for use in the Vietnam war and these guns are now being used widely by criminal elements in the United States and in this

<sup>138</sup> Debates, House of Commons, 11 May 1977, p. 5525, [https://parl.canadiana.ca/view/oop.debates\\_HOC3002\\_06/135?r=0&s=1](https://parl.canadiana.ca/view/oop.debates_HOC3002_06/135?r=0&s=1).

<sup>139</sup> Criminal Law Amendment Act, 1977, SC 1976–77, c. 53, s. 3.

## The History of Gun Control in Canada

country. Therefore, as a matter of public policy it seems to me that we should endeavour to restrict their availability and use in Canada as much as possible.<sup>140</sup>

Minister Basford asserted that “there is no proper hunting use for these guns.”<sup>141</sup> He explained:

Many of these guns are of low calibre and would wound more deer than they would ever kill. Some of them are quite inaccurate in terms of target. They are not good shooting weapons. I could bring before the House a stack of textbooks on rifles and guns indicating that these particular weapons serve no useful hunting purpose.<sup>142</sup>

The power of the Governor in Council to declare specific firearms as restricted weapons was expanded greatly with the 1977 legislation. It removed the 1969 Criminal Code provision that said a restricted firearm was a “weapon of any kind, not being a shotgun or rifle of a kind commonly used in Canada for hunting or sporting purposes, that is declared by order of the Governor in Council to be a restricted weapon.” Instead, the 1977 legislation declared that a restricted firearm was:

a weapon of any kind, not being a prohibited weapon or a shotgun or rifle of a kind that, *in the opinion of the Governor in Council, is reasonable for use in Canada for hunting or sporting purposes*, that is declared by order of the Governor in Council to be a restricted weapon.<sup>143</sup>

This new provision was designed to expand the authority of the Governor in Council to make certain firearms restricted. Henceforth, it was possible for the Governor in Council to act if it was of the *opinion* that a model of firearm was *unreasonable* for use as a hunting or sporting arm. Later governments used this provision to restrict many firearms. Minister Basford explained to Parliament’s Standing Committee on Legal and Constitutional Affairs that it was necessary for the federal government to use Orders in Council to restrict models of firearms. He opposed a

## The History of Gun Control in Canada

proposed amendment to the 1977 legislation that would “force the government to list in the legislation each weapon that is to be restricted. If we are going to list the .30 calibre M1 carbine, there are at least five weapons which should be listed. I suggest that it is not practical to require an amendment each time that a weapon was to be restricted.”<sup>144</sup> He also noted that if legislation included the makes and models of restricted firearms, then the gun industry could avoid the restrictions by slightly altering weapons to create new models that avoided the restricted classification: “To list the .30 calibre M1—this would be easily avoided by having a slightly different calibre. Then it would not be restricted and yet would be readily available on the market, and as I say, readily adapted for criminal purposes.”<sup>145</sup>

The “prohibited weapon” definition was also expanded in the 1977 legislation. All automatic weapons were henceforth prohibited, although owners of automatic weapons could retain them as restricted firearms if they registered them by the time the legislation came into force. Ownership of automatic firearms was thus “**grandfathered**” with this provision, but the commercial sale of automatic guns was prohibited.<sup>146</sup> The 1977 ban on automatic firearms is frequently cited by opponents of gun control today as the moment when Canada prohibited “assault rifles,” which they define as only including rifles with a “select-fire” capability allowing them to fire in a fully automatic mode. But as noted earlier, many gun makers in the 1970s had

<sup>144</sup> Minutes of Proceedings and Evidence on Justice and Legal Affairs, respecting Bill C-51, Criminal Law Amendment Act, No. 22 (16 June 1977), Second Session of the Thirtieth Parliament, pp. 21–22, [https://parl.canadiana.ca/view/oop.com\\_HOC\\_3002\\_9\\_2/729?r=0&s=3](https://parl.canadiana.ca/view/oop.com_HOC_3002_9_2/729?r=0&s=3).

<sup>145</sup> Ibid, p. 222, [https://parl.canadiana.ca/view/oop.com\\_HOC\\_3002\\_9\\_2/729?r=0&s=3](https://parl.canadiana.ca/view/oop.com_HOC_3002_9_2/729?r=0&s=3).

<sup>146</sup> The 1977 legislation also prohibited any rifle or shotgun that was altered so that its barrel was less than 18 inches or had an overall length of less than 26 inches (such as “sawed-off” shotguns). Criminal Law Amendment Act, 1977, SC 1976–77, c. 53, s. 3.

## The History of Gun Control in Canada

begun producing semi-automatic military-style firearms that lacked the option of firing with a fully automatic action.<sup>147</sup>

The fact that the legislation made length an important factor in rendering a firearm restricted proved controversial, in part because semi-automatic centre-fire rifles that barely exceeded the statutory provision regarding length were not restricted. In addition, the 1977 legislation did not prevent the introduction of new and potentially dangerous firearms. For example, in 1981 the press reported that a semi-automatic version of the UZI submachine gun had appeared on the Canadian market and had been classified as a restricted firearm.<sup>148</sup> The decision to restrict only semi-automatic centre-fire rifles with barrels less than 18.5 inches became an issue almost immediately. In December 1977, the federal cabinet issued an Order in Council listing five firearms as restricted on the ground that “in the opinion of the Governor in Council” none were “reasonable for use in Canada for hunting or sporting purposes.” The five restricted weapons were listed in the 1977 OIC as:

- (a) the semi-automatic carbine known as the “Commando Mark III”;
- (b) the auto-loading twelve-gauge shotgun known as the “High Standard Model 10, Series ‘A’” or “High Standard Model 10, Series ‘B’”;
- (c) the semi-automatic action rifle known as the “Commando Mark V”;
- (d) the semi-automatic action rifle known as the “Thompson Model 27A-1”;
- and
- (e) the semi-automatic action rifle known as the “Colt Model AR-15”.<sup>149</sup>

<sup>147</sup> The federal government also slightly altered the power of the Governor in Council to declare a firearm a prohibited weapon. The legislation provided that a prohibited weapon was a firearm “of any kind, not being an antique firearm or a firearm of a kind commonly used in Canada for hunting or sporting purposes, that is declared by order of the Governor in Council to be a prohibited weapon.” The 1977 legislation thus slightly expanded the limitation on the ability of the Governor in Council to prohibit firearms. If a firearm was an antique or was commonly used for hunting or sporting purposes (and was not a shortened firearm or an automatic firearm) it could not be prohibited. Criminal Law Amendment Act, 1977, SC 1976–77, c. 53, s. 3.

## The History of Gun Control in Canada

The Parliamentary Secretary to the President of the Privy Council, Yvon Pinard, explained to the House of Commons in January 1978 why the government chose to restrict the AR-15:

This decision was taken by the government because it is of the view that the AR-15 has no legitimate sporting use and is closely modelled along military lines. It was felt that weapons of this kind should not be readily available to anyone, and that control should be exercised over those who possess them.<sup>150</sup>

Owners of AR-15 rifles were upset with the classification of this firearm as a restricted weapon, and in 1979 the Progressive Conservative government of Prime Minister Joe Clark issued an Order in Council re-classifying the AR-15 as a firearm rather than as a restricted weapon.<sup>151</sup> Then, in late 1980 a new Order further reduced the list of firearms made restricted by the 1977 OIC, retaining only the “High Standard Model 10, Series ‘A’” and “High Standard Model 10, Series ‘B’” semi-automatic shotguns as restricted firearms.<sup>152</sup> In 1982, however, the federal government issued a new Order in Council that restricted the semi-automatic FN-FAL rifle (Canada’s standard infantry weapon at the time), “including any reproductions thereof or modifications thereto.”<sup>153</sup> The Canadian Association of Chiefs of Police explained that this addition was a preventive measure, as the FN-FAL was a “military weapon” and “designed for combat.” It had been discontinued by several foreign militaries, which meant that the rifle “could potentially flood the gun market by selling at low cost.”<sup>154</sup>

## The History of Gun Control in Canada

By the mid-1980s, pressure began to mount on the federal government to address the availability of semi-automatic assault-style rifles. The Progressive Conservative government of Prime Minister Brian Mulroney considered legislation before the occurrence of the Montreal Massacre. In the spring of 1989, the government announced its intention to prohibit firearms that had originally been manufactured as automatic weapons but had been converted to semi-automatics to comply with the 1977 ban on automatic rifles. This proposal stemmed from a fear that criminals could reconvert such semi-automatic rifles to fire automatically.<sup>155</sup> However, before the Progressive Conservative took this step, the Montreal Massacre occurred on 6 December 1989, highlighting the damage that could be caused by semi-automatic assault-style rifles and drawing attention to their availability in Canada.

*iii. An Act to Amend the Criminal Code and the Customs Tariff..., SC 1991, c. 40*

The government of Prime Minister Mulroney responded to the Montreal Massacre with new gun controls. Its first legislative effort, Bill C-80, died on the Order Paper, but many of the proposals in Bill C-80 were subsequently included in Bill C-17. Bill C-17 made several meaningful changes to Canada's gun laws. These included strengthening background checks, imposing a mandatory 28-day waiting period for a Firearms Acquisition Certificate (FAC), requiring mandatory safety training, and increasing penalties for firearm-related crimes. Bill C-17 also targeted the use of some assault-style rifles in Canada.<sup>156</sup> Parliament sought to mitigate the

<sup>156</sup> Samuel A. Bottomley, "Locked and Loaded: Gun Control Policy in Canada" in Robert M. Campbell, Leslie A. Pal, and Michael Howlett (eds.), *The Real Worlds of Canadian Politics: Cases in Process and Policy* (Peterborough: Broadview Press, 2004) 30–33. Bill C-17 slightly revised the "prohibited weapon" definition, providing that a prohibited weapon was a "weapon of any kind, not being an antique firearm or a firearm of a kind commonly used in Canada for hunting or sporting purposes, or a part, component or accessory of such a weapon, or any ammunition, that is declared by order of the Governor in Council to be a prohibited weapon." An Act to Amend the Criminal Code and the Customs Tariff in Consequence Thereof, SC 1991, c. 40, s. 2(3).

## The History of Gun Control in Canada

dangers of assault-style firearms by prohibiting large-capacity cartridge magazines for such firearms (discussed below). Further, Parliament prohibited automatic firearms that had been converted to avoid the 1978 prohibition, though possession of these guns was grandfathered, thus allowing genuine gun collectors to retain them.

The Progressive Conservative government targeted rifles manufactured as semi-automatics that used designs based on modified fully automatic firearms. At the second reading of the bill, Minister of Justice Kim Campbell carefully explained the government's desire to limit access to what she called "modern semi-automatic military assault weapons." Minister Campbell's remarks reflected the popular demand for action on semi-automatic assault-style rifles, as well as demonstrating the way in which Parliamentarians have long used the language of "assault rifles," the history of concerns about the availability of semi-automatic firearms based on military designs, and the perceived appropriateness of using Orders in Council to restrict or prohibit particular models of firearms. Minister Campbell declared, "All Canadians are aware of the need for changes to Canada's gun control system."<sup>157</sup> She addressed the growing problem of assault-style rifles in civilian hands and asserted that Parliament needed to focus on more strictly regulating "types of firearms associated with the greatest risk to public safety, and relatively few, if any, legitimate sporting uses."<sup>158</sup> She explained that this meant more stringently regulating assault-style firearms:

There have been concerns raised about the increasing prevalence of military and high fire-power firearms in Canada since the law was last amended in 1978. Hon. members will recall that effective controls on fire power were a major component of my earlier legislative proposals.

There are still serious concerns about these firearms that this House must address, and they remain a key element of the current proposals. These firearms

<sup>157</sup> Debates, House of Commons, 6 June 1991, p. 1249, [https://parl.canadiana.ca/view/oop.debates\\_HOC3403\\_01/1151?r=0&s=1](https://parl.canadiana.ca/view/oop.debates_HOC3403_01/1151?r=0&s=1).

<sup>158</sup> *Ibid.*, p. 1253.

## The History of Gun Control in Canada

represent a much greater danger to the public than others and they are dealt with accordingly.

Those who own military or paramilitary firearms, fully automatic or converted fully automatic firearms face a much greater degree of restriction than others because their guns are much more dangerous. They are designed and intended for military, not sporting uses.<sup>159</sup>

However, the Progressive Conservative government was interested in not only more strictly regulating automatic firearms that had been converted to semi-automatics. Minister Campbell told the House that the government also intended to target the use of other semi-automatic rifles:

When I initially introduced Bill C-80, I indicated that it was also my intention to designate other types of military or paramilitary firearms as restricted or prohibited weapons.

This is intended to restrict the availability of the most dangerous firearms, and at the same time, underscore the traditional Canadian idea that firearms in society are more properly regarded as tools for hunting or sporting purposes and not weapons for personal or civil defence. These roles are very capably performed by the police and the armed forces of Canada and should not serve as a justification for the private ownership of firearms.

It is not my intention, however, to restrict or prohibit every single type of firearm that has ever seen military service. I recognize that many older-style military guns have seen valuable service as hunting firearms.

What I am concerned about, and what the legislation seeks to control, are *modern military firearms that contain high firepower, fast-firing mechanisms, large capacity cartridge magazines, and other characteristics that make them very dangerous weapons, and have little or no place in legitimate sporting activities*. Where there are relatively few legitimate uses for these firearms, they would be prohibited altogether.

Where they are used for some forms of legitimate target shooting, they may be designated as restricted weapons, which would allow the activity to continue, but protect the public by registering and tracking the guns and their owners.

I want to reassure those who own obsolete military firearms such as the Lee Enfield that this proposal is intended to reduce access to the most *modern semi-automatic military assault weapons*.<sup>160</sup>

Minister Campbell then addressed the reasons the government would continue to use Orders in Council to restrict or prohibit models of firearms rather than legislation:

---

<sup>159</sup> Ibid.

<sup>160</sup> Ibid, p. 1254 (emphasis added).

## The History of Gun Control in Canada

As Canadian firearms owners are aware, a portion of the gun control system is enacted by a combination of regulations and Orders in Council made under the legislative authority of the Criminal Code. This combined approach makes for a better system for all concerned because it allows for flexibility and clarity which would not be possible using the statute alone.<sup>161</sup>

Minister Campbell explained that the use of regulations was vital to ensuring that the gun control regime was sufficiently nimble and flexible:

[T]he fundamental goal of gun control in Canada is to protect the public from firearms violence, while at the same time preserving the interests of legitimate firearms owners and users as much as possible. Regulatory powers are an important tool for this task.

The use of regulations allows the law to focus closely on the firearms, individuals, and situations that raise public safety concerns.

Regulations allow for flexibility in the law to achieve effective gun control in ways that can still permit legitimate activities to continue.

Statutory powers are much broader. Attempting to use them to accomplish regulatory controls on firearms would result in a much less responsive and effective gun control system.<sup>162</sup>

Minister Campbell noted that the government's bill did not include a list of firearms to be restricted or prohibited because the existing legislation already allowed the government to act through Orders in Council: "The prohibition or restriction of military or paramilitary firearms is not in the Bill. This is because the power to do this by Order in Council already exists in the statute itself. No statutory amendment was necessary."<sup>163</sup>

Cabinet subsequently issued Orders in Council prohibiting or restricting many assault-style rifles (as well as some long-range sniper rifles, shotguns, and handguns). In the "Explanatory Note" regarding the prohibition of many firearms that accompanied Prohibited Weapons Order, No. 11, the federal government indicated that this classification was made under the Criminal Code provision allowing for firearms to be prohibited if not normally used for

---

<sup>161</sup> Ibid, p. 1256.

<sup>162</sup> Ibid, p. 1257.

<sup>163</sup> Ibid.

## The History of Gun Control in Canada

hunting or sporting purposes. The prohibition orders were “an important component of the policy of limiting firepower to levels that are reasonably required for hunting or sporting purposes in Canada.”<sup>164</sup> The federal government explained that:

Firearms form a continuum ranging from common hunting and target-shooting guns to high-powered, military or para-military guns having little or no legitimate sporting purpose. Canada’s gun control scheme places increasing restrictions on access to firearms, up to and including complete prohibition, as firepower increases and sporting utility declines.<sup>165</sup>

Prohibited Weapons Order No. 11 listed seventeen models of rifles “and any variant or modified version thereof” as prohibited weapons. The order also prohibited three models of shotguns and their variants or modified versions, and fifteen models of semi-automatic pistols and their variants and modified versions. An additional three models of rifles and three models of pistols (plus variants) were also prohibited in Prohibited Weapons Order No. 12, although they could be retained if they had been registered as restricted weapons by 1 October 1992.<sup>166</sup> Some of the prohibited semi-automatic firearms were based on military designs that had been limited to semi-automatic functioning, such as the Steyr AUG rifle and UZI, and their variants. The prohibition orders also included some long-range sniper/anti-material rifles, such as the .50 calibre Barrett “Light Fifty” Model 82A1 and Iver Johnson AMAC. Another Order in Council classified 24 models of firearms (and their variants and modified versions) as restricted. Many of these models were semi-automatic versions of standard military assault rifles. These models included the AK-47 and M-16 (including AR-15).<sup>167</sup>

## The History of Gun Control in Canada

Bill C-17 and the subsequent Orders in Council were significant steps in limiting access to assault-style firearms. However, critics noted that the actions of the Progressive Conservative government still left some models of centre-fire semi-automatic rifles as non-restricted firearms, including the Ruger Mini-14 model used in the Montreal Massacre. This meant that potentially dangerous semi-automatic centre-fire rifles remained widely available, either as non-restricted or restricted firearms. A 1990 study prepared on Progressive Conservative legislative proposals by the Research Branch of Library of Parliament concluded: “It must be acknowledged that even weapons designed and manufactured as semi-automatic hunting and recreational shooting rifles and shotguns can be used to create carnage. The Montreal tragedy bears dramatic witness to this potential.”<sup>168</sup>

*iv. Liberal Gun Controls*

After the 1993 federal election, the new Liberal government pursued additional gun control measures. The Cabinet issued a new Order in Council in 1994 declaring more models of firearms to be prohibited firearms.<sup>169</sup> Minister of Justice Allan Rock announced that the government intended to prohibit a “wide variety of military type weapons,” including “several types of military and paramilitary firearms that are designed to imitate weapons used by the army and the police and are intended not for hunting or farming but for combat.”<sup>170</sup> Minister Rock also promised that the Liberal Government would eventually prohibit the Ruger Mini-14 model used

## The History of Gun Control in Canada

in the Montreal Massacre (though this was not done by the end of Jean Chrétien’s term as Prime Minister).

In the “Regulatory Impact Analysis Statement” that accompanied the 1994 Order in Council, the federal government indicated that the Order would move “23 semi-automatic variants of assault rifles” from the list of restricted weapons and to the list of prohibited weapons.<sup>171</sup> The impact statement explained that this would affect approximately 10,000 firearms. Owners of the newly prohibited rifles could retain them, but the firearms could not be transferred, meaning that when the existing owner died or wanted to dispose of the prohibited firearm, the firearm had to be destroyed, deactivated, exported, or given to a museum. The 23 firearms and their variants that became prohibited under 1994 OIC (effective 1 January 1995) were:

- AK-47
- Armalite AR-180
- Beretta AR-70 assault rifle
- BM 59 rifle
- Bushmaster Auto Rifle
- Cetme Sport Auto Rifle
- Daewoo K1 rifle
- Demro Tac-1M Carbine
- Eagle Apache Carbine
- FN-FNC rifle
- FN-FAL rifle
- G3 rifle
- Galil assault rifle
- Goncz High-Tech Carbine
- Heckler and Koch HK 33 rifle
- J & R Eng M-68 carbine
- Leader Mark Series Auto Rifle
- MP5
- PE-57 rifle
- SIG SG-550 rifle / SG-551 carbine
- SIG AMT rifle
- Springfield Armoury SAR-48
- Thompson Submachine gun

<sup>171</sup> Prohibited Weapons Order No. 13, PC 1994-1974 (29 November 1994), Canada Gazette, Part II, Vol. 128, no. 25 (SOR/94-741).

## The History of Gun Control in Canada

The 1994 OIC was the last major Order prohibiting models of semi-automatic, assault-style rifles prior to PC 2020-298, though the regulations listing restricted and prohibited firearms were consolidated in 1998.<sup>172</sup>

The Liberal government passed a major new piece of gun control legislation, Bill C-68, which received Royal Assent on 5 December 1995. Bill C-68 included Criminal Code amendments affecting firearms and created the Firearms Act to take many administrative and regulatory aspects of firearm licensing and registration out of the Criminal Code. Bill C-68 included a universal licensing system and a requirement that the registration system be expanded to include all long guns (as noted earlier, handguns had been registered since the 1930s). In addition, the legislation provided harsher penalties for certain serious crimes using firearms.

Bill C-68 made an important change in the definitions of “restricted firearms” and “prohibited firearms” in the Criminal Code, removing the qualifier about hunting or sporting purposes. Instead, a “prohibited firearm” became “any firearm that is prescribed to be a prohibited firearm.” Similarly, a “restricted weapon” became “a firearm of any other kind that is prescribed to be a restricted weapon.”<sup>173</sup> However, Bill C-68 also included a provision (which became s. 117.15 of the Criminal Code) indicating that in making regulations, the Governor in Council

may not prescribe anything to be a prohibited firearm, a restricted firearm, a prohibited weapon, a restricted weapon, a prohibited device or prohibited ammunition if, in the opinion of the Governor in Council, the thing to be prescribed is reasonable for use in Canada for hunting or sporting purposes.<sup>174</sup>

<sup>172</sup> Regulations Prescribing Certain Firearms and Other Weapons, Components and Parts of Weapons, Accessories, Cartridge Magazines, Ammunition and Projectiles as Prohibited or Restricted, PC 1998-1662 (16 September 1998), (SOR/98-462).

<sup>173</sup> Firearms Act, SC 1995, c. 39, s. 139.

<sup>174</sup> *Ibid.*

## The History of Gun Control in Canada

Section 117.15 thus significantly expanded the authority of the Governor in Council to prohibit firearms by adopting the same language that had allowed the government to restrict firearms. Henceforth, the Governor in Council could prohibit firearms if it was of the *opinion* that a firearm was *not reasonable* for use in Canada for hunting or sporting purposes.

The government's intention in expanding the authority to prohibit firearms was explained to the House of Commons Standing Committee on Justice and Legal Affairs by Minister Rock, who noted that the provision would address a loophole in the legislation that had allowed an individual to bring a new model of firearm into Canada, create a shooting event in which to use the firearm, and then rely on that event as evidence that the firearm was commonly used in order to defeat the power of the Governor in Council to prohibit the firearm:

Now, at the moment it's possible for someone to bring a firearm into Canada most people would agree that is not appropriate for such purposes [sporting or hunting purposes] and then, using that firearm, to create shooting events, and then to rely on that event as evidence that it's commonly used, in order to defeat the prohibition power.

The change is intended to overcome that tactic by providing that the order may be made to prohibit firearms that are not reasonable for such purposes.

I think that reflects what Canadians want to see. We don't want to have military-type assault weapons in this country that are justified only because someone has invented a shooting contest to rely upon as evidence that they can't be prohibited.<sup>175</sup>

The legislative change was thus intended to allow Government to prohibit more easily "military-type assault weapons designed only for the purpose of combat and killing." Section 117.15 would provide that if a firearm was "not reasonable for use in hunting and sporting purposes, then it can be prohibited."<sup>176</sup>

<sup>175</sup> Minutes of Proceedings and Evidence, Standing Committee on Justice and Legal Affairs, respecting Bill C-68, No. 147 (19 May 1995), First Session of the Thirty-Fifth Parliament, p. 0955, [https://www.ourcommons.ca/Content/Archives/Committee/351/jula/evidence/147\\_95-05-19/jula147\\_blk-e.html](https://www.ourcommons.ca/Content/Archives/Committee/351/jula/evidence/147_95-05-19/jula147_blk-e.html).

<sup>176</sup> Ibid.

## The History of Gun Control in Canada

*v. Post-1995 Legislative Action*

Following the passage of Bill C-68, much of the political debate and public discussion about gun control concerned the new licensing regime and, especially, the long-gun registry. While the governments of Prime Ministers Jean Chrétien and Paul Martin defended the long-gun registry, the Conservative government of Prime Minister Stephen Harper passed legislation in 2012 to eliminate it.<sup>177</sup>

The use of Orders in Council to identify some semi-automatic models of rifles as restricted or prohibited firearms rather than classifying all semi-automatic centre-fire rifles the same proved increasingly problematic as many new models of such guns entered the Canadian market. As a result, new models of assault-style rifles with barrels longer than 470 millimeters or that were more than 660 millimeters in total length were often classified as non-restricted firearms, unless they were deemed variants of a restricted or prohibited model of firearm.

Gun control advocates pressed the federal government to take steps to prohibit or restrict new firearm models that were functionally the same as guns that had been restricted or prohibited in the 1990s. The Governments of Prime Minister Martin and Prime Minister Harper, however, did not take this step. In fact, the Government of Prime Minister Harper issued an Order in Council in 2015 that downgraded the classifications of two models of semi-automatic rifles (the CZ 858 rifle and certain Swiss Arms firearms) after gun owners complained about the classification of these rifles as prohibited firearms. In 2014, the federal government first provided an amnesty period for these prohibited firearms, then in 2015 passed the Common Sense Firearms Licensing Act.<sup>178</sup> This legislation amended s. 84(1) of the Criminal Code to

---

<sup>177</sup> Ending the Long-gun Registry Act, SC 2012, c. 6, [https://laws-lois.justice.gc.ca/eng/annualstatutes/2012\\_6/page-1.html](https://laws-lois.justice.gc.ca/eng/annualstatutes/2012_6/page-1.html).

<sup>178</sup> Common Sense Firearms Licensing Act, SC 2015, c. 27, [https://laws-lois.justice.gc.ca/eng/annualstatutes/2015\\_27/page-1.html](https://laws-lois.justice.gc.ca/eng/annualstatutes/2015_27/page-1.html).

## The History of Gun Control in Canada

stipulate that a non-restricted firearm was “a firearm that is neither a prohibited firearm nor a restricted firearm” or was “a firearm that is prescribed to be a non-restricted firearm.”<sup>179</sup> The Common Sense Firearms Licensing Act amended s. 117.15 of the Criminal Code by adding subsections stating:

(3) Despite the definitions “prohibited firearm” and “restricted firearm” in subsection 84(1), a firearm that is prescribed to be a non-restricted firearm is deemed not to be a prohibited firearm or a restricted firearm.

(4) Despite the definition “prohibited firearm” in subsection 84(1), a firearm that is prescribed to be a restricted firearm is deemed not to be a prohibited firearm.<sup>180</sup>

In other words, the Conservative Government allowed for the overriding of the statutory definition of restricted and prohibited firearms through Orders in Council. The federal government then issued an Order in Council that reclassified the CZ 858 and Swiss Arms rifles from prohibited and made them either non-restricted or restricted firearms (depending on the length of the firearms).<sup>181</sup>

The Liberal Party under Justin Trudeau declared a desire to limit the availability of assault-style firearms. In 2015, the Party’s election platform included a promise to “get handguns

<sup>179</sup> Ibid, s. 18.

<sup>180</sup> Ibid, s. 34. Steven Blaney, the Minister of Public Safety and Emergency Preparedness, told the House of Commons that the 2015 legislation would allow the federal government to reclassify firearms to a less restrictive class, notwithstanding the definitions in the Criminal Code, through Orders in Council:

The common-sense firearms licensing act would end the ability of the Canadian firearms program to make a final decision on the reclassification of firearms without the oversight of an elected member of Parliament. We are doing this because the owners of the Swiss Arms and the CZ firearms are law-abiding citizens and should not be treated as criminals. This is why we are bringing this legislation forward for that specific part. Therefore, the government would have an oversight mechanism for decisions on the classification of firearms.

Minister Blaney’s comments suggested that the Conservative Party believed that Cabinet should have authority to classify firearms to a less restrictive class. Debates, House of Commons, 26 November 2014, p. 9833, <https://www.ourcommons.ca/Content/House/412/Debates/149/HAN149-E.pdf>.

## The History of Gun Control in Canada

and assault weapons off our streets.”<sup>182</sup> In 2019, the federal government passed Bill C-71, An Act to Amend Certain Acts and Regulations in Relation to Firearms.<sup>183</sup> Bill C-71 repealed the parts of the Common Sense Firearms Licensing Act that had provided authority to override the firearms classification definitions in section 84 of the Criminal Code. Bill C-71 also allowed for the reversal of the regulations that had revised the classification of the Swiss Arms rifles and CZ 858 rifles. However, the Bill used a grandfathering provision for some models of the CZ and Swiss Arms firearms to allow owners to retain them.

Another controversial topic related to the classification of firearms has been the use of the term “variant” in the Orders in Council listing restricted and prohibited firearms. Some gun owners have complained that “variant” is not defined in Canada’s firearms legislation. However, reliance on a common understanding of the term “variant” is a deliberate feature of the statutory scheme. As noted earlier, since the late 1970s the federal government has expressed concern that listing prohibited or restricted models of firearms in legislation would allow gun manufacturers to circumvent the rules by slightly altering firearms, thereby avoiding the higher classification assigned to those firearms. The same concern has led federal authorities listing restricted and prohibited firearms in Orders in Council to include variants of those weapons. A comprehensive list of firearm descriptions and classifications is provided by the RCMP in the Firearms Reference Table (FRT), which is available to law enforcement, gun retailers, and, since 2019, the public.<sup>184</sup>

## The History of Gun Control in Canada

The government of Prime Minister Harper did not end the use of the term “variant” in the regulations listing prohibited and restricted firearms. However, some Conservative Members of Parliament have sought to narrowly define the meaning of “variant.” In 2016, for example, MP Larry Miller introduced Private Member’s Bill C-230, which would define a variant as “a firearm that has the unmodified frame or receiver of another firearm.”<sup>185</sup> This narrow definition meant that any firearm with a “modified” frame or receiver could not be deemed a variant. Mr. Miller said that this change to Canada’s firearm legislation “will ensure that firearms that are classified as variants do in fact share fundamental mechanical pieces and therefore warrants the firearm to have the same classification as the previously classified firearm.” At second reading of the Bill, Mr. Miller noted the role of firearms advocacy groups in drafting the legislation, expressing his thanks to the “Canadian Shooting Sports Association for all of the help and guidance it has provided in the drafting of the bill.”<sup>186</sup>

Liberal MP Michel Picard, the Parliamentary Secretary to the Minister of Public Safety and Emergency Preparedness, explained why Government did not support the Private Member’s Bill regarding the definition of variants. He noted that the term “variant” had been used since 1992 “in response to the considerable increase in new firearm models available in the civilian market. The intent was to ensure that new firearms entering the market between regulation updates would be covered until the next update.” Mr. Picard pointed to the consequences of the Bill if it became law, noting that it would “mean a massive and indiscriminate reclassification of

<sup>185</sup> Bill C-230, An Act to Amend the Criminal Code (Firearm—Definition of Variant), 1st Session, 42nd Parliament, Canada, 2016, <https://www.parl.ca/DocumentViewer/en/42-1/bill/C-230/first-reading#BEPPage> (accessed 28 April 2021).

## The History of Gun Control in Canada

firearms.”<sup>187</sup> Mr. Picard suggested that Bill C-230 “would move many firearms to a more restricted class to the detriment of law-abiding gun owners. Yet on the other hand, it would also have the effect of reclassifying thousands of firearms to a less controlled class, with potentially serious repercussions.”<sup>188</sup> Mr. Picard drew attention to the fact that the proposed definition of variant would change the classification of many assault-style rifles to non-restricted:

Permit me to draw the attention of members to one particularly troubling example from a public safety perspective. Under this legislation, certain prohibited assault weapons would become non-restricted. Presently, for example, a semi-automatic firearm that is a variant of the AK-47 assault rifle is prohibited based on the regulations. However, if we were to adopt the proposed definition of a variant in Bill C-230, in other words, a firearm that has an unmodified frame or receiver of another firearm, a firearm virtually identical to the AK-47 could become non-restricted. This would occur because, according to the proposed definition, the slightest change of the design of the frame or receiver of the firearm would mean that it would no longer be considered a variant of a virtually identical gun.

[...The result of this would likely be] a dramatic increase in the circulation of firearms that are currently prohibited because they would become available to some two million licence holders. People would be able to import, own, transfer, and transport these firearms more freely. What is more, we would not be able to track these weapons because it is not mandatory to register unrestricted firearms.<sup>189</sup>

In October 2018, Prime Minister Trudeau tasked Minister of Border Security and Organized Crime Reduction Bill Blair with conducting a national consultation to consider prohibiting civilian ownership of handguns and “assault weapons.”<sup>190</sup> Firearm groups objected to the term “assault weapons” in the original terms of reference for the consultation. They charged that assault weapons referred only to firearms that had a “select fire” capability—that is, that could be fired in either semi-automatic or automatic modes. The government agreed to abandon

## The History of Gun Control in Canada

the term “assault weapon” and instead adopted “assault-style rifle.”<sup>191</sup> The consultation process included roundtables and bilateral meetings with various organizations representing gun owners, victims of violence, provincial and municipal governments, police, First Nations, and medical professionals. Many of these people or groups tended to be either strongly in favour of or opposed to gun control. The government also solicited written feedback and launched an online consultation process to allow anyone to complete a survey and offer comments on the idea of banning handguns and assault-style rifles. The design of the consultation process produced results suggesting that banning handguns and assault-style rifles was a polarizing idea. The report found that “participants were strongly polarized on the issue of banning handguns and assault-style firearms.”<sup>192</sup> The online questionnaire results largely reflected the views of gun owners, who reportedly filled out the questionnaire in large numbers. The consultation received almost 135,000 completed questionnaires. However, one firearms owner admitted that he submitted up to 35,000 responses using a computer program.<sup>193</sup>

The government did not use an Order in Council to prohibit more models of firearms before the 2019 election, despite pressure to do so by gun control advocates.<sup>194</sup> Instead, the Liberal Party made gun control a plank of its 2019 election platform, thus allowing Canadian

## The History of Gun Control in Canada

voters to weigh in on whether assault-style rifles should be prohibited. The Liberals promised to “ban assault rifles and crack down on gun crime” and targeted “military-style assault rifles,” saying these guns were “designed to inflict mass casualties and have no place in Canada.”<sup>195</sup> The Liberal Party indicated that it would “move forward with a ban on all military-style assault rifles, including the AR-15” and take other steps to keep people safe from gun violence, including: providing more resources for law enforcement; working with provinces and territories to give municipalities the ability to further restrict access to handguns or even to ban them; ensuring that the Canada Border Services Agency and RCMP had the resources needed to detect and stop the flow of firearms at Canada’s borders; and strengthening safe-storage laws.<sup>196</sup> These promises in the Liberal Party’s 2019 election platform undermine the view that PC 2020-298 (SOR/2020-96) was simply a response to the mass casualty event in Nova Scotia in April 2020.

On the thirtieth anniversary of the mass shooting at École Polytechnique in December 2019, the Liberal government indicated that it would act. Prime Minister Trudeau said that his government would “strengthen gun laws and ban the type of weapons used at Ecole Polytechnique.”<sup>197</sup> On 1 May 2020, shortly after the mass casualty in Nova Scotia, Prime Minister Trudeau announced PC 2020-298, a ban on nine models and their variants (encompassing at the time approximately 1,500 versions) of semi-automatic centre-fire rifles, as well some other firearms, including some long-range rifles and shotguns. The government offered arguments in favour of prohibiting these models of firearms and their variants consistent

## The History of Gun Control in Canada

with the concerns about the availability of assault-style firearms offered by previous Liberal and Progressive Conservative governments since the 1970s. The Regulatory Impact Assessment Statement that accompanied PC 2020-98 noted that such firearms posed “a serious threat to public safety given the degree to which they can increase the severity of mass shootings.”<sup>198</sup> The Statement also noted that the prohibited firearms primarily originated in military designs and expressed an intent to prevent their use in mass shootings or diversion into the illegal market.

PC 2020-298 essentially revised the list of prohibited models of firearms, which, as noted earlier, had not been substantially updated by Orders in Council since the mid-1990s. The government added assault-style rifles to the prohibited list that legislators had either not included in earlier prohibitions or had entered the Canadian market since the mid-1990s. The newly prohibited firearms are similar in capability to the firearms prohibited in the 1990s. The models captured by this prohibition share certain characteristics, including that they can receive a detachable magazine, generally use centre-fire ammunition, and can fire with a semi-automatic function.<sup>199</sup> The following models (and their variants) were prohibited (see also **Figure 10**):

- **AR-15:** The AR-15 is a semi-automatic version of the standard military firearm, the M-16, used during much of the Vietnam War by the United States. After the patent for the AR-15 expired, other gun-makers began selling generic models in the civilian market.
- **Vz58:** The Vz58 rifle began as a select-fire assault rifle for military service. It was first manufactured in Czechoslovakia in the late 1950s. Civilian versions were later produced that fired with a semi-automatic action.
- **M14:** The M14 became the standard-issue rifle for the US military in the late 1950s until it was replaced by the M16 rifle. Civilian semi-automatic models were sold in Canada.

<sup>199</sup> Information on the following models of firearms prohibited by PC 2020-298 is drawn from several sources, including Richard D. Jones, *Jane's Weapons: Infantry, 2018–2019* (Coulson: IHS Global, 2018); Richard, *Modern Firearms*; F.W.A. Hobart (ed.), *Jane's Infantry Weapons, 1975* (London: Jane's Yearbooks, 1975); Terry J. Gander and Ian V. Hogg, *Jane's Infantry Weapons, 1995–96* (Coulson: Jane's Information Group, 1995).

## The History of Gun Control in Canada

- **Ruger Mini-14:** The Ruger Mini-14 was first produced in the early 1970s. According to the 1975 edition of *Jane's Infantry Weapons*, the design of the Mini-14 was “clearly based on the design principles” of earlier American military rifles.<sup>200</sup> It was designed with a fully automatic firing capability, but civilian models were sold as semi-automatics. The Mini-14 has been used by police forces and a handful of military units.
- **Beretta Cx4 Storm carbine:** The Beretta Cx4 Storm, first produced in 2003, is a semi-automatic firearm aimed at the civilian and law enforcement markets. A military version, the Beretta Mx4 Storm, is capable of fully automatic fire.
- **Robinson Armament XCR:** The Robinson Armament XCR was designed as a select-fire rifle for military use, including as a possible weapon for US special operations. Robinson Armaments indicated in 2004 that the XCR was “designed to be the finest assault rifle available anywhere,” and that it would have a select-fire capability.<sup>201</sup> However, Robinson Armaments now produces only a semi-automatic version of the XCR rifle.
- **CZ Scorpion EVO 3 carbine and pistol:** The Scorpion EVO 3, first produced in 2009, has both military (capable of fully automatic fire) and civilian (semi-automatic) versions. Military users of the Scorpion EVO 3 include the armed force of the Czech Republic, Hungary, Poland, and Serbia.
- **SIG Sauer SIG MCX and SIG Sauer SIG MPX carbines and pistols:** The SIG MCX, first produced in 2015, is a family of firearms produced in both select-fire and semi-automatic versions, with the semi-automatic versions sold in civilian markets. The SIG MPX, first produced in 2015, is also available in fully automatic or semi-automatic models, with the semi-automatic version sold in civilian markets. Various police forces and militaries in Europe are users of the SIG MCX or SIG MPX.
- **SG-550 rifle and SG-551 carbine, including SAN Swiss Arms:** The Swiss Arms Classic Green and Four Seasons derive from the SG 550 rifle, which was first produced in the mid-1960s. Military versions have select-fire capability, while civilian models can fire in semi-automatic mode.

## The History of Gun Control in Canada

*vi. Prohibition Efforts around the World*

Efforts to limit access to semi-automatic assault-style firearms are not unique to Canada.

Legislators in many nations have identified assault-style rifles as potentially dangerous if misused and have taken steps to regulate their use or even to prohibit them.

Mass shootings have contributed to concerns over assault-style rifles in the United States, though the American government has been unable to pass a gun law that effectively limits the availability of such firearms. Congress passed the Violent Crime Control and Law Enforcement Act in 1994, which became known as the federal Assault Weapons Ban.<sup>202</sup> The Assault Weapons Ban prohibited the manufacture, transfer, or sale of a limited number of semi-automatic firearms. The legislation specifically named some models as banned, such as the UZI, Steyr AUG, and AR-15. The legislation also banned semi-automatic rifles that could use detachable magazines and possessed at least two of several characteristics, including a collapsible stock, a pistol grip, a bayonet mount, a flash suppressor, or a mount for a grenade launcher. The Ban was critiqued by gun control advocates as incomplete, and firearms manufacturers began to redesign firearms to avoid the assault weapons classification. Firearms already in civilian hands could also remain in circulation and be used. In addition, the Assault Weapons Ban had a ten-year sunset provision, and the legislation was allowed to expire in 2004.<sup>203</sup>

Three prominent Commonwealth countries serve as examples of jurisdictions that have aggressively limited the availability of semi-automatic centre-fire rifles: the United Kingdom, Australia, and New Zealand. All three countries have implemented sweeping prohibitions on assault-style rifles. While Canada has prohibited particular models of such firearms, these

## The History of Gun Control in Canada

Commonwealth jurisdictions have implemented more systematic bans. The 1987 Hungerford Massacre in Britain led to the Firearms (Amendment) Act 1988, which banned most semi-automatic and pump-action centre-fire rifles. Small-calibre rifles, such as those that fired .22 rim-fire ammunition, were unaffected.<sup>204</sup>

The Port Arthur Massacre in Australia in 1996 was committed by a gunman with semi-automatic rifles. Shortly after, Prime Minister John Howard pressed the Australian states to adopt the National Firearms Agreement. This was necessary because the Constitution of Australia does not give the Commonwealth direct power to enact gun laws. The National Firearms Agreement included a ban on semi-automatic rifles and all semi-automatic and pump-action shotguns, and a system of licensing and ownership controls. A federally financed gun buyback scheme was introduced, and almost 700,000 guns were bought back and destroyed.<sup>205</sup>

Following the mosque shootings in Christchurch in 2019, the New Zealand government passed the Arms (Prohibited Firearms, Magazines, and Parts) Amendment Act 2019, banning most semi-automatic firearms, magazines, and parts.<sup>206</sup> (Firearms designed to discharge rim-fire cartridges of .22 calibre or less were excluded.) The government also announced an amnesty and buy-back scheme for prohibited firearms and components.<sup>207</sup>

The steps taken by the United Kingdom, Australia, and New Zealand highlight that the concern in Canada with the availability of assault-style rifles is not unique. These countries have

<sup>204</sup> Firearms (Amendment) Act, UK Public General Acts 1988 c. 45.

## The History of Gun Control in Canada

all taken steps to strictly limit the availability and use of such guns. So, too, have some other democratic and economically advanced nations, including Japan and South Korea, which prohibit civilian ownership of assault-style rifles.<sup>208</sup>

*vii. Magazine Capacity Restrictions*

Mass shootings have highlighted the lethality of assault-style firearms when paired with large capacity magazines. The shooter in the 1989 Montreal Massacre, for example, was armed with a Ruger Mini-14 semi-automatic rifle loaded with 30-round capacity magazines.<sup>209</sup> To mitigate the potential harm caused by criminal use of semi-automatic rifles and handguns, some restrictions on the size of magazines have been introduced.

Following the Montreal tragedy, the Progressive Conservative government of Prime Minister Mulroney introduced limits on the size of magazines. Minister of Justice Campbell explained to the House of Commons in discussing Bill C-17 that because the “addition of a large magazine can convert almost any ordinary semi-automatic hunting rifle into an assault weapon,” the government would “designate large capacity magazines to be prohibited weapons.”<sup>210</sup> The government’s legislation would allow the Governor in Council “to specify the types of magazine that will be limited and the capacity limits to be applied.”<sup>211</sup> This was necessary, Minister Campbell explained: “Limiting the size of magazines will supplement the other measures by placing effective limits on the firepower of guns that are on the borderline between military and

<sup>211</sup> *Ibid.*

## The History of Gun Control in Canada

sporting applications.”<sup>212</sup> That is, the government hoped that limiting the size of magazines for semi-automatic centre-fire rifles would reduce the damage that could be done by shooters, even if the government did not restrict or prohibit such rifles.

In 1991, Bill C-17 included the provision that a prohibited weapon included “a large capacity cartridge magazine prescribed by regulation.”<sup>213</sup> The Progressive Conservative government subsequently issued an Order in Council that limited the capacity of magazines for most semi-automatic handguns to ten rounds and limited the capacity of most semi-automatic centre-fire rifle magazines to five rounds. No magazine size restrictions were imposed for manual-action firearms or rim-fire .22 calibre semi-automatic rifles. The government also made exceptions to the magazine rule for some semi-automatic centre-fire rifles, particularly guns that could not be used without the magazines designed for them. For example, the regulations did not apply to the M-1 Garand rifle, which used a specific 8-round en bloc clip, internal magazine.<sup>214</sup> Many magazines for assault-style rifles were made to conform to these regulations by “pinning” the magazine with a rivet to prevent them from accepting more than five rounds.

Three major weaknesses in the restrictions on magazine capacity have undermined the goal of the government of Prime Minister Mulroney to make assault-style rifles less dangerous:

- 1) Gun owners have taken advantage of legal loopholes that allow for the use of oversize magazines in some assault-style rifles (see examples below).
- 2) Some magazines can be altered to hold more than the permitted five rounds.
- 3) Large-capacity magazines are illegally acquired in Canada.<sup>215</sup>

## The History of Gun Control in Canada

Groups representing the firearms community have frequently highlighted these issues, though they do so to urge the repeal of the limitations on the size of magazines, not to strengthen the law. In its official policy position, the Canadian Coalition for Firearm Rights (CCFR) states that one of the rationales for its opposition to magazine restrictions is that “pinned” magazines are easily altered so that they can accept more ammunition:

[I]f one has a criminal intent to use a firearm and wishes to use a standard capacity magazine [i.e., a magazine larger than the current legislated limit], one merely has to use a power drill to remove the rivet which pins it at the legal capacity. The rivet therefore only prevents lawful firearm users from enjoying standard capacity magazines, not criminals.<sup>216</sup>

In other words, the CCFR says that a criminal using an assault-style rifle needs only to remove a rivet from magazines to increase their capacity beyond the five-round legal limit that applies to most long guns. Similarly, in 2015 the National Firearms Association (NFA) organized a petition demanding the abolition of magazine size limits on the ground that pinned magazines could easily be modified to hold more than the legal limit:

If one has a criminal intent to use a firearm illegally, and wishes to use a standard capacity magazine, one merely has to use a power drill to remove the rivet which pins it at the legal capacity. The rivet therefore only prevents lawful firearm users from enjoying standard capacity magazines, not criminals.<sup>217</sup>

The CCFR has also noted that legal gun owners have identified loopholes that allow a semi-automatic rifle to use a large-capacity magazine. The loophole stems from the fact that some legal magazines that can hold more than five rounds are compatible with semi-automatic

## The History of Gun Control in Canada

rifles, thus substantially increasing the number of rounds such rifles are allowed to hold.

According to the CCFR,

There are lawful ways of achieving higher magazine capacities. For example, there are variants of the AR 15 that fire .50 Beowulf cartridges. The magazines for these firearms fit all AR 15 variants. These magazines can also hold 14 rounds of 5.56 mm NATO ammunition. These are not prohibited devices but do permit lawful users of AR 15 rifles to load more than five rounds in their magazines. To the same effect are LAR-15 magazines which hold 10 rounds because they are designed for a pistol. However, they also fit all AR 15 variants. Finally, there are a number of rifles designed to take pistol magazines. For example, the JR carbine uses Glock magazines, and the Beretta Cx4 storm carbine uses Beretta pistol magazines.<sup>218</sup>

In other words, Canadian gun owners have several ways of legally circumventing the prohibition on large capacity magazines.<sup>219</sup>

Some criminals have taken advantage of the legal loopholes in the magazine rules or altered magazines to allow the magazines in their assault-style rifles to hold more rounds of ammunition. In 2006, the perpetrator at the Dawson College shooting in Montreal that left one person dead (plus the shooter) and nineteen injured was armed with a Beretta Cx4 Storm semi-automatic rifle that could use a ten-round magazine. In 2017, a man allegedly armed with a semi-automatic Aero Survival Rifle (which can legally hold a ten-round handgun magazine) shot at several vehicles in British Columbia and shot a hiker.<sup>220</sup> The man who attacked the Montreal Metropolis nightclub in 2012 to stop premier-designate Pauline Marois from celebrating her victory in the Quebec election had a magazine for his CZ 858 rifle that had been illegally

<sup>218</sup> Ibid. Also see Patrick Cain, “Packing Heat: How Gun Law Loopholes Tripled Canada’s Rifle Magazine Limits,” *Global News*, 11 June 2013.

<sup>219</sup> The use of legal loopholes has been encouraged by some gun advocates. For example, in 2014, the current CEO of the CCFR, Rod Giltaca, produced a YouTube video for his Civil Advantage Firearms Training company encouraging gun owners to buy the .50 Beowulf cartridge because such cartridges allowed the user to load fourteen rounds of ammunition. He noted that he had fired hundreds of rounds using such magazines. “14 Rounds in an AR Mag??? Press Check 50 Beowulf Magazine Review,” YouTube, uploaded by Civil Advantage, 30 Jun 2014, <https://youtu.be/TVTSVowayL8> (accessed 3 May 2021).

<sup>220</sup> Patrick White, “Three Years Ago, Loopholes in Canada’s Gun Laws Paved the Way for a Highway Rampage in BC. Why Has Nothing Changed?” *Globe and Mail*, 8 August 2020.

## The History of Gun Control in Canada

modified so that it could hold 30 rounds of ammunition.<sup>221</sup> Similarly, the shooter in Moncton in 2014 who killed three RCMP members modified magazines that had been pinned to five rounds so that they could hold twenty rounds of ammunition.<sup>222</sup> And the man who attacked the Islamic Cultural Centre of Quebec City had two illegal magazines that each could hold 30 rounds of ammunition for his semi-automatic Vz 58 rifle.<sup>223</sup>

PC 2020-298 seems designed to narrow the magazine loopholes by prohibiting firearms such as the Beretta Cx4 storm carbine that can legally receive magazines that hold more than five rounds. Prohibiting other models of assault-style rifles also reduces the chances that people can use altered magazines or large-capacity magazines that have been illegally acquired.

## VII. POLICY PROPOSALS

### 1. Revisions to Firearm Classification System

While PC 2020-298 has updated the list of prohibited firearms, it has banned only some of the weapons that could be defined as “assault-style” rifles. Again, this stems from the current system of firearm classification that uses both statutory provisions to classify rifles based on their characteristics (length and firing system) and Orders in Council to name individual models of firearms (and their variants) as either restricted or prohibited.

The federal government indicated that it chose the firearms to prohibit in 2020 based on three considerations. They “(1) have semi-automatic action with sustained rapid-fire capability

(tactical/military design with large magazine capacity), (2) are of modern design, and (3) are present in large volumes in the Canadian market.”<sup>224</sup> The number of models that did not qualify using this analysis is unknown.

An example of a firearm that illustrates the piecemeal approach to the classification of firearms is the SKS rifle (see **Figure 11**). The SKS originated in the 1940s as a Soviet-designed military weapon. Described in National Rifle Association literature as a “a homely, though robust, rifle,”<sup>225</sup> it was superseded by the more famous AK-47 rifle for Soviet military use in the 1950s. The Soviet Union, however, allowed other countries to produce the SKS, with the result that manufacturers in places like China and Yugoslavia made millions of SKS rifles, and dozens of countries used them as military firearms. Many surplus SKS rifles went into the civilian market of the United States starting in the 1980s.

## The History of Gun Control in Canada

Advertisements for SKS rifles appeared in Canadian newspapers in the 1990s. Beginning in the same decade, there were several reports of SKS rifles being used in criminal incidents. In 1995, a Whitehorse man was charged with murder; his weapon was an SKS rifle. In 1997, an intruder fatally shot a Vernon, BC couple with an SKS. In 2007, an Edmonton youth killed a family member with an SKS. There are also more recent incidents. In 2016, a home intruder with an SKS rifle killed two people in Courtenay, BC. In 2017, a gunman armed with an SKS rifle murdered a police officer in a parking lot in British Columbia. In the same year, a Nova Scotia man legally purchased an SKS rifle, then killed his wife, daughter, and mother before also killing himself. And, in 2019, two teenagers legally purchased a SKS rifle in British Columbia, killed three people, and sparked a massive manhunt until they died by suicide. Despite this record, the SKS rifle remains a non-restricted firearm. It can be purchased by anyone with an ordinary Possession and Acquisition Licence (PAL). The SKS was possibly left off the list of newly prohibited weapons because the SKS is not a “modern design.” Or perhaps it was left off the prohibited list because it has an internal box magazine and thus lacks “sustained rapid-fire capability.”<sup>226</sup>

Other assault-style rifles remain classified only as restricted firearms or, in some cases, are non-restricted. For example, the WK180-C (see **Figure 12**) is a non-restricted rifle. It is a semi-automatic rifle that fires 5.56 NATO ammunition and uses a detachable magazine.<sup>227</sup> In 2019, an author in a Canadian periodical catering to gun owners described the WK-180-C as “a

Source: Cabela's Canada, <https://www.cabelas.ca/product/139315/kodiak-defence-wk180-c-semi-auto-rifle> (accessed 22 December 2021)

Another example of a modern assault-style rifle that remains a non-restricted firearm is the IWI Tavor (see **Figure 13**). The Tavor is a semi-automatic rifle that uses a five-round detachable magazine. It is based on a design with a "select-fire" capability used by the Israeli military.

Source: Cabela's Canada, <https://www.cabelas.ca/product/101583> (accessed 20 December 2021)

A third example of a modern assault-style rifle that remains non-restricted is the Norinco Type 97 (See **Figure 14**). The Norinco Type 97 uses a detachable magazine, fires .223 ammunition, and is based off a rifle designed for use by the Chinese military.

*Figure 14: Cabela's Catalogue, "Norinco TYPE 97 NSR-G3 Semi-Automatic Rifle"*

Most supporters and opponents of gun control in Canada agree that the classification system needs systematic reform. Opinion diverges widely, however, over how best to revise the classification system for semi-automatic centre-fire rifles. Several options are available:

## The History of Gun Control in Canada

**Eliminate the classification system:** Some opponents of gun control have argued that Canada should abandon the firearms classification system. For example, the former president of the National Firearms Association, Sheldon Clare, has frequently expressed that Canada should repeal its firearm classification, registration, and licensing systems.<sup>229</sup> This position is extreme, and its adoption would represent the abandonment of most of the key gun control efforts in Canada introduced since the nineteenth century. It would allow consumers to legally purchase dangerous weapons, including fully automatic firearms.

**“Simplified classification system”:** Some groups representing gun owners advocate for a “simplified classification system.” Under a simplified classification system, automatic rifles would remain prohibited. Restricted weapons would include handguns, as well as firearms that can be fired when reduced to less than 660 millimeters in length. All other firearms would be non-restricted. In other words, if a firearm is not an automatic weapon, a handgun, or a short, concealable weapon it would be non-restricted.<sup>230</sup> Gun lobbyists have advocated for a simplified classification system because it could lower the classification of many semi-automatic rifles like the AR-15, meaning they would be much easier to acquire and use. These guns would also no longer be registered, making them more difficult to track.

**Restrict all centre-fire semi-automatic rifles:** Another option is to change the classification of all currently non-restricted semi-automatic centre-fire rifles to restricted weapons. This would improve recordkeeping by requiring the registration of these guns. It would

<sup>229</sup> See, for example, National Firearms Association (NFA), “NFA Talk S1E24 Wrap Up Show,” National Firearms Association, 31 December 2020, <https://nfa.ca/2020/12/31/nfa-talk-s1e24-wrap-up-show/> (accessed 22 March 2022).

<sup>230</sup> Canadian Coalition for Firearm Rights (CCFR), “Policy Memorandum No. 15-5: Classification of Firearms,” 16 July 2019, <https://firearmrights.ca/15-5-classification-of-firearms> (accessed 1 March 2022); Daniel Fritter, “CPC Convention 2016: The Firearms Policy Proposal,” *Calibre*, 27 May 2016, <https://calibremag.ca/cpc-convention-2016-firearms-policy-proposal/> (accessed 1 March 2022).

## The History of Gun Control in Canada

also discourage “straw purchasing”—that is, the purchase of firearms by a person with a Possession and Acquisition License with the intent of illegally transferring those weapons to someone without a license—because the legal purchaser could be traced if such weapons were subsequently used for illegal purposes. However, this would not stop all straw purchasing, as evidenced by the fact that handguns are sometimes legally purchased in Canada and then illegally transferred.<sup>231</sup> Changing the classification of all currently non-restricted semi-automatic, centre-fire rifles to restricted firearms would probably also discourage the purchase of such weapons, as there are limits on the use of restricted firearms for hunting. The tougher rules governing transportation and storage of restricted firearms might lessen the likelihood of these guns being stolen and used for criminal activity.

**Prohibit all centre-fire semi-automatic rifles:** Canada could follow the example of jurisdictions such as the United Kingdom, New Zealand, and Australia and ban the civilian possession of semi-automatic centre-fire rifles. This approach would treat similar weapons consistently. Police authorities and the public could easily identify prohibited weapons since the classification system would no longer be based on models named by Orders in Council, the determination of variants, or firearm length. However, a buyback program for all such firearms would be expensive.<sup>232</sup> Some firearm owners would also resist this measure, but, as in the United Kingdom, Australia, and New Zealand, gun owners would still be able to purchase manual-

<sup>231</sup> Josee St-Onge, “Straw Purchasing Puts More Legally Bought Guns in the Hands of Alberta Criminals: ALERT,” *CBC News*, 14 June 2018; Anna Junker, “Three Men Facing 26 Charges in Straw Buying, Firearms Trafficking Operation,” *Edmonton Journal*, 7 January 2021.

<sup>232</sup> The Parliamentary Budget Office estimates that the buy-back of the firearms prohibited on 1 May 2020 will cost between 47 and 756 million dollars. This wide range stems from uncertainty concerning the number of affected firearms, the take-up rate for the buy-back program, and the pricing structure used to value firearms. Parliamentary Budget Officer, “Cost Estimate of the Firearm Buy-Back Program,” 3. Prohibiting additional firearms would of course increase costs further.

## The History of Gun Control in Canada

action firearms as well as small-calibre semi-automatic rifles to participate in hunting and target shooting.

**Tighten magazine restrictions:** Another policy change could address the use of oversize magazines in assault-style rifles. This could be done by prohibiting any magazine that can be modified to hold more than five rounds of ammunition. The federal government could also make it illegal to use a magazine that can accept more than five rounds. This would mitigate the risk of shooters using assault-style rifles to inflict high numbers of casualties.<sup>233</sup>

### 2. Smuggling

Opponents of new gun controls in Canada often suggest that any legislative action will prove ineffective because criminals will simply acquire firearms illegally, often by accessing guns smuggled into Canada from the United States. The issue of smuggled firearms is undoubtedly a serious issue. A 2006 study of gun smuggling at the Canada–United States border explained how firearms illegally enter Canada:

A large volume of persons and goods legally moves across the Canada and United States border through designated ports of entry. Criminal entities may try to exploit this cross-border traffic to smuggle firearms and other weapons into Canada, utilizing a variety of conveyances that include private vehicles, aircraft, commercial vehicles, boats, and other means. In some instances, those conveyances are altered to include specially designed concealment locations.

Illegal firearms are also smuggled across the vast unmanned border areas by individuals carrying contraband items in backpacks and via all-terrain vehicles and private vehicles. Criminals also sometimes use a small number of Native American/Aboriginal reserves and/or territories situated on or near the border to

<sup>233</sup> In its 2021 election platform, the Liberal Party of Canada included such proposals. It said a reelected Liberal government would “crack down on high-capacity magazines and require that long gun magazines capable of holding more than 5 rounds be permanently altered so that they can never hold more than five rounds.” And further that the Liberals would “ban the sale or transfer of magazines that could hold more than a legal number of bullets, regardless of how they were intended to be used by the manufacturer.” Liberal Party, “Forward. For Everyone,” 62, <https://liberal.ca/wp-content/uploads/sites/292/2021/09/Platform-Forward-For-Everyone.pdf> (accessed 2 January 2022).

## The History of Gun Control in Canada

move illegal firearms from the United States to Canada and/or as storage locations for subsequent illegal distribution.<sup>234</sup>

Despite the challenges of preventing firearms from entering Canada illegally, the Canadian Border Services Agency (CBSA) indicates that it seized 4,263 firearms at ports of entry from 1 January 2014 to 6 September 2020.<sup>235</sup>

Evaluating the extent of the gun smuggling problem is complicated by the fact a) officials can report only on firearm smuggling efforts that are interdicted; b) some crime guns are not recovered; and c) the origin of many crime guns cannot be determined. In some parts of Canada, smuggled firearms seem to make up a substantial percentage of crime guns, but in other areas domestically sourced firearms appear to be the major problem. In a 2007 report on gun smuggling and illegally trafficked firearms, the RCMP determined that handguns were the most common firearm seized in urban centres, whereas long guns (which were less likely to be smuggled) were more prevalent in rural areas. In most parts of British Columbia, the RCMP determined that handguns were the most common illegal firearm. On the other hand, on the prairies, long guns were preferred by criminals. In Quebec and Atlantic Canada, long guns were the most seized firearms, except in large urban areas, where handguns were more commonly

<sup>234</sup> Canada–US Consultative Group on Firearms Trafficking, “Combating Illicit Firearms: A 2006 Canada and United States Overview,” Minister of Public Works and Government Services Canada (2006) 3, <https://www.publicsafety.gc.ca/cnt/rsrscs/pblctns/archive-cmbtng-llct-frrms/archive-cmbtng-llct-frrms-eng.pdf> (accessed 20 December 2021). Gun smuggling has complicated the efforts to regulate firearms in the other country that shares a land border the United States. Mexico has strong gun control laws but suffers from high levels of gun crime, often committed with firearms smuggled into Mexico from the United States. In response, the government of Mexico has launched a lawsuit against American gun makers, arguing that the firearms industry knowingly contributes to illegal arms trafficking through reckless business practices. US Government Accountability Office, “Firearms Trafficking: US Efforts to Combat Firearms Trafficking to Mexico Have Improved, but Some Collaboration Challenges Remain,” 11 January 2016, <https://www.gao.gov/products/gao-16-223> (accessed 1 March 2022); Gabriela Martinez, “The Flow of Guns from the US to Mexico Is Getting Lost in the Border Debate,” *PBS*, 2 July 2019, <https://www.pbs.org/newshour/politics/the-flow-of-guns-from-the-u-s-to-mexico-is-getting-lost-in-the-border-debate> (accessed 1 March 2022); BBC, “Gun Makers Ask US Court to Dismiss Mexico’s Claim for Damages,” *BBC News*, 23 November 2021.

<sup>235</sup> Tim Naumetz, “Canadian Agents at the US Border Have Seized 4,000 Guns since 2014,” *iPolitics*, 28 October 2020, <https://ipolitics.ca/2020/10/28/canadian-agents-at-the-u-s-border-have-seized-4000-guns-since-2014/> (accessed 20 December 2020).

## The History of Gun Control in Canada

seized.<sup>236</sup> Smuggled firearms also appear to be used in some forms of criminal activity more than others. Spousal homicide, for example, is often committed by Canadians who legally own their firearms (such as Lionel Desmond in Nova Scotia).<sup>237</sup> Other firearms used in criminal activity are stolen from legal gun owners or gun stores, such as the semi-automatic handgun used in the 2018 Danforth shooting in Toronto.<sup>238</sup>

All of this suggests that gun smuggling will remain an issue in Canada, though it cannot be assumed that the illegal cross-border firearm trade is or will be the primary source of crime guns. A multi-pronged approach may mitigate the problem by a) limiting the flow of smuggled firearms through joint Canadian–American law enforcement efforts; and b) dissuading gang activity that often creates a demand for illegal weapons. The current government of Canada has prioritized efforts to reduce firearm smuggling as part of its effort to address gun violence. It has promised to invest additional resources to interdict firearms illegally transported into Canada and is attempting to increase cooperation between Canadian and American authorities to interfere with organized gun smuggling efforts.<sup>239</sup>

## The History of Gun Control in Canada

**VIII. CONCLUSION**

Canada has a long history of regulating the ownership and/or use of firearms. Legislators since the latter part of the nineteenth century have expressed concern about the availability of mass-produced handguns. Parliament therefore passed a series of measures to limit when and where such firearms could be carried and used, to track handguns, and to ban some models of handguns. Concern with the ownership of assault-style rifles has grown since they first began to enter the Canadian civilian market. For example, the Canadian Association of Chiefs of Police first objected to the presence of such firearms in the 1970s. The Montreal Massacre, as well as other mass shootings in Canada, the United States, and around the world, highlighted for many citizens, organizations, and elected officials the potential dangers of assault-style firearms if misused. This public awareness has contributed to high levels of support for stronger gun controls in Canada, including limits on the availability of assault-style firearms, as reported by large-scale professional public polling.

Canada has adopted a legislative framework for regulating semi-automatic centre-fire rifles that is less restrictive than that used in some other nations, including the United Kingdom, Australia, New Zealand, Japan, and South Korea, where such firearms have largely been prohibited. Instead, Canada's Parliament has sought to legislatively restrict or prohibit firearms with certain characteristics, while intentionally using the flexible tool of Orders in Council to restrict or prohibit models of firearms deemed more dangerous than those necessary for legal hunting and target shooting purposes.

[true](https://www.canada.ca/en/border-services-agency/news/2021/03/government-of-canada-takes-further-action-with-domestic-and-us-partners-to-combat-illicit-firearms.html) (accessed 9 March 2022); Canada Border Services Agency, "Government of Canada Takes Further Action with Domestic and US Partners to Combat Illicit Firearms," news release, 31 March 2021, <https://www.canada.ca/en/border-services-agency/news/2021/03/government-of-canada-takes-further-action-with-domestic-and-us-partners-to-combat-illicit-firearms.html> (accessed 22 March 2022).

## The History of Gun Control in Canada

The legislative history of the provisions allowing for the use of Orders in Council shows that Parliament has moved towards expanding its ability to restrict or prohibit firearms. Governments have used this authority to restrict or prohibit many models of firearms since the 1970s. The historical context of gun control in Canada demonstrates that PC 2020-298 (SOR/2020-96) reflects a continuation of the firearm policies employed by the federal government since the 1970s. This has seen the use of Orders in Council alongside legislation to restrict or prohibit many firearms that are deemed dangerous, while still allowing widespread civilian firearm ownership.

In the future, Canadian policymakers and legislators would be wise to revise the system of firearm classifications. A particularly important policy issue is whether Canadians should have access to semi-automatic firearms. As noted, Canada has adopted an approach that leaves some of these guns in civilian hands while restricting or prohibiting other assault-style rifles. Similarly, the federal government has prohibited revolvers or semi-automatic handguns with short barrels while leaving handguns with slightly longer barrels on the market.

**GLOSSARY**

- Assault-style rifle:** An assault-style rifle is a semi-automatic, centre-fire rifle that often originates from a military design and can receive a detachable magazine. In the debates about gun control in Canada, such firearms have at various times been referred to as “paramilitary rifles,” “military-style rifles,” “modern sporting rifles,” “black rifles,” and “assault weapons.”
- Automatic rifle:** An automatic rifle loads and fires cartridges so long as the trigger is depressed and there are cartridges available.
- Bolt-action rifle:** A bolt-action rifle is manually loaded, cocked, and unloaded by pulling a bolt mechanism up and back to eject a spent cartridge and then pushed forward and down to load a new cartridge from the magazine.
- Calibre:** Calibre refers to the approximate internal diameter of a rifle barrel or the diameter of the projectile it fires. Firearm calibres are designated in millimeters or inches. Examples include 5.56 mm (which is similar in size to the .223-inch calibre) or 7.62 mm (or .308-inch calibre).
- Cartridge:** A cartridge is a single round of ammunition consisting of the case, primer, propellant, and one or more projectiles.
- Centre-fire cartridge:** A centre-fire cartridge is designed so that its primer is central to the axis at the head of the case. Most cartridges are centre-fire, except for rim-fire ammunition such as small-calibre .22 ammunition.
- Classification:** Canada classifies all firearms as either non-restricted, restricted, or prohibited.
- Grandfathering:** “Grandfathering” means that gun owners can retain certain prohibited firearms that were registered by specific dates.
- Handgun:** According to the Criminal Code, RSC 1985, c. C-46, s. 84(1), a handgun is a firearm designed, altered, or intended to be aimed and fired by the action of one hand, whether or not it has been redesigned or subsequently altered to be aimed and fired by the action of both hands.
- Lever-action rifle:** A lever-action rifle is manually loaded through the use of a lever, generally located under the trigger.
- Magazine:** A magazine is the receptacle in or attached to a firearm that holds several cartridges that are fed into the chamber. Magazines take many forms. They can be fixed or detachable. They can also accommodate different numbers of rounds.
- Non-restricted firearm:** According to the Criminal Code, RSC 1985, c. C-46, s. 84(1), a non-restricted firearm is a firearm that is neither a prohibited firearm nor a restricted firearm or a firearm that is prescribed by regulations to be a non-restricted firearm.

## The History of Gun Control in Canada

**Prohibited device:** The Criminal Code (RSC 1985, c. C-46, s. 84(1)) defines a prohibited device as: a) any component or part of a weapon, or any accessory for use with a weapon, that is prescribed to be a prohibited device; b) a handgun barrel that is equal to or less than 105 mm in length (but does not include any such handgun barrel that is prescribed, where the handgun barrel is for use in international sporting competitions governed by the rules of the International Shooting Union); c) a device or contrivance designed or intended to muffle or stop the sound or report of a firearm; d) a cartridge magazine that is prescribed to be a prohibited device; or e) a replica firearm.

**Prohibited firearm:** Prohibited firearms include a) handguns with barrels equal to or less than 105 mm in length; b) handguns designed or adapted to discharge a .25 or .32 calibre cartridge (except for handguns for use in international sporting competitions governed by the rules of the International Shooting Union and where the handgun is prescribed to be restricted); c) firearms adapted from a rifle or shotgun, whether by sawing, cutting or any other alteration, and that, as so adapted are: i) less than 660 mm in length; or are ii) 660 mm or greater in length and have a barrel less than 457 mm in length; d) automatic firearms, whether or not altered to discharge only one projectile with one pressure of the trigger; e) firearms prescribed to be prohibited firearms by regulation.

**Restricted firearm:** Restricted firearms include handguns that are not prohibited firearms. It also includes other firearms that are not prohibited firearms, have a barrel less than 470 mm in length, and are capable of discharging centre-fire ammunition in a semi-automatic manner. Restricted firearms are also those designed or adapted to be fired when reduced to a length of less than 660 mm by folding, telescoping, or otherwise. Finally, restricted firearms are those firearms of any kind prescribed to be restricted firearms by regulation.

**Rim-fire cartridge:** A cartridge containing the priming mixture in the rim of its base. Rim-fire cartridges are normally used in small calibre rifles, such as .22 calibre rifles.

**“Select fire”:** “Select fire” refers to a feature that allows a firearm to be fired either semi-automatically or fully automatically. The mode of firing is selected by the user. Assault rifles used by militaries now generally have this feature.

**Semi-automatic firearm:** With a semi-automatic firearm, each pull of the trigger results in the weapon’s discharge and reloading.

## **I. Introduction**

### **1. Scope of Report**

This report addresses the role of culture in making sense of significant events such as those under study by the Mass Casualty Commission. Specifically, this report reviews the literature on police culture and culture in other organizational and occupational contexts to the extent that relevant and useful analogies can be drawn. It offers an account of culture as an analytical tool or lens that assists in understanding institutional responses to mass casualty events and in developing recommendations.

### **2. Structure and Substance of Report**

This report describes three ways of understanding “culture” in policing that are invoked by three distinct areas of scholarship: (1) criminology and police studies; (2) sociology of culture; and (3) organizational sociology. Each literature offers a unique approach to defining and measuring culture in the context of policing, but they are presented here as building on one another. For instance, though the specific topic of “police culture” appears most prominently in criminological research and in police studies, commentators in these fields often appropriate the term “culture” without engaging explicitly with the concept or its deeper sociological significance. This report therefore addresses some of the limitations in definitions and applications of “police culture” that appear in criminology and police studies, turns to the sociology of culture and organizations to fill in gaps.

In the social sciences, culture is understood as an interpretive process (Geertz 1973), and theoretical principles are critical for establishing indicators of cultural practice. Therefore, this report explicitly theorizes “police culture” to offer an account of culture as an analytical tool for interpreting the events under study by the Commission. Specifically, one cannot presume to

## Culture in Police Organizations

simply begin by outlining the distinctive dimensions of a unique “police culture” without first establishing the foundations of cultural meaning. Doing so dooms culture to a static and one-dimensional understanding of social life. This is particularly problematic for a public institution like policing, which is especially vulnerable to the whims of social, political, legal, and economic fluctuations, as well as the demands that accompany these shifts. Indeed, as Banton argued decades ago, “not a single social change fails to change the institution of policing” (1964: ix).

More importantly, there are practical matters with in policing that derive benefit from more explicit theorizing of police culture. As Diane Vaughan’s (1996) seminal work on NASA and the Challenger explosion revealed, organizational culture is inevitably “on the hook” when something goes awry. For example, when police officers participate in some form of misconduct, outsiders attribute their behaviour to the department’s culture. Accordingly, police leaders are subject to constant external pressures from political figures, media groups, and the public to “change the culture of the department.” What does this mean? Inherent in this demand is also an assumption that “the culture” – presumed to be known – can indeed be changed by the commanding authorities. Is this accurate? Where is culture located so that we may begin to change it? What insights do those who study culture specifically have that can shed on these questions? This report turns to the sociology of culture and organizational sociology for these insights. Scholars working in these areas do not argue that people are immersed in a culture that dictates how they will act but refer instead to a “repertoire” of *resources* that are deployed in order to bring justification to their experiences. Accordingly, people know more culture than they use at a given moment (Swidler 1986). The key to unpacking culture, then, is to unveil when, where, and how particular sets of cultural resources are put to work.

Reaching for other literatures about culture also helps to reconcile a common issue with representations of “police culture,” which is itself a loaded term in mainstream references. Pairing the words “police” and “culture” evokes a negative synecdoche. “Police culture” is routinely wielded by the media, political figures, community stakeholders, and academics for condemnatory purposes—as synonymous and therefore interchangeable with words like “corruption,” the “thin blue line,” “racism,” or “brutality.” Though descriptors like these can of course be applied to a number of police practices, a predetermined and inherently negative slant to the term itself diminishes the sociological usefulness of “police culture” as an analytical concept. Culture in a workplace—in a corporate office, a university, a hospital, or police department—is the very thing that allows any meaning-making to take place at all. There is nothing *inherent* to any culture. Rather, it is the lens—a mechanism—through which people understand their world. Organizations are complex sites of contestation and shared premises, change as well as stasis, and organizational culture provides members with a system of meanings to navigate accordingly. This report reaches for theoretical tools across three literatures that capture vital nuance behind the cultural resources police officers deploy as they traverse the various institutional structures of their particular occupational environment.

## II. Criminology and Police Studies

In a review of academic police research, Manning (2005) has differentiated between what he considers to be two related but distinct categories of study: “sociology *of* the police” and “sociology *for* the police.” The former, Manning has suggested, “explores the relevance of theories and concepts as they apply to the organization, occupation, and its impacts—an enterprise that is analytically driven and data based” (2005: 30). In contrast, the latter is more “devoted to ameliorative aims—to elevate the level of performance ... improve management and

## Culture in Police Organizations

operations of the police, and to reduce the ambiguity of their tasks” (30). While this distinction is not to suggest these approaches to research are mutually exclusive, they are meant to highlight differences between the studies’ target audiences, theoretical insights, and methodological techniques. They also differ in their emphasis on social, political, and economic factors: studies *for* the police adopt a more concentrated focus on those factors that pertain to efficiency and the internal policies of the police department, while studies *of* the police are often more attuned to how social, structural features external to the police manifest within the institution of policing and are expressly connected to social, behavioural, and cultural facets of occupational life. Therefore, with its emphasis on culture, this section reviews literature that bears most resemblance to sociology written *of* rather than *for* the police.

### 1. The Policing Function: A Little History about an Old Problem

Research on the police has provided clear consensus that the most fundamental police function is “order-maintenance” rather than “crime-fighting.” However, as foundational police scholars have explained, this is not how society tends to perceive the police (Bittner 1972), nor is it how the police themselves view their role. *The Policeman in the Community* by Michael Banton (1964), *Justice Without Trial* (1966) by Jerome Skolnick, *Varieties of Police Behavior* (1969) by James Q. Wilson, and *Violence and the Police* (1970) by William Westley all share a common message: the underlying contradiction between an officer’s typical day on the job and how they and the public conceive of their occupational identity poses a number of problems in efforts to understand and effectively manage the day-to-day work of policing—problems that persist to this very day. At the root is the role of **discretion** in policing. Simply put, police discretion refers to “the leeway that officers enjoy in selecting from more than one choice in carrying out their work”—choices that include *non-law* enforcement activity (Mastrofski 2004: 101).

This report begins with a nod to the classics and a reference to police discretion to underscore an important point about the policing function: in contrast to the objective enforcement of clear laws, order maintenance often necessitates the use of discretion and thus implicates an officer's subjectivity. This subjective discretionary function requires police to make sense of moments, people, and places as they carry out their duties. As culture serves as the very mechanism through which people navigate and understand their world, this means that "police culture" is exceptionally important for understanding police actions and for efforts at police reform. Indeed, one of the most commonly cited statements made by patrolmen in Wilson's (1969) study and by police officers in the present day is that "you can't always go by the book," emphasizing the need for officers to adapt their tactics according to situational realities and occupational conditions.

Classic police studies reveal that we do not—and perhaps cannot—have a stable definition of the "policing" concept. In today's era of questioning policing in our communities, debating the implications of "defunding," and contemplating which tasks should fall within the mandate of law enforcement or of social welfare service, these lessons remain relevant. As these foundational works suggest, if there are "varieties of police behavior" (Wilson 1969) and police officers are "in the community" (Banton 1964), the police idea, then, is socially embedded. Furthermore, if police engage in order maintenance rather than universal law enforcement, their use of discretion is paramount. The meaning systems that suffuse policing are subject to variation across groups, time, and place, and so the implications of "culture" in policing are of utmost importance.

## 2. Is There a “Police Culture”?

In light of ambiguity about the function of the police, the disconnect between officer expectations and reality “on the ground,” and the discretionary nature of the job, early police scholars uncovered a “way of being” that guides and shapes the behavioural social world of the police. Most famously, Skolnick (1966) argued that police officers are called upon to develop a specific “work personality” that serves as a type of survival tactic in the day-to-day routines of the policing profession. Skolnick explained that the “working police personality” is a result of several elements peculiar to the environment of law enforcement, especially danger, stress, and the hierarchical structure of the organization. He also saw this personality as a response to the authoritarian model that is characteristic of policing and as an outcome of constant pressure to be productive and efficient. Westley (1970) later refined the subject to describe a true “culture” that is generated by the isolation and threatening nature of the job. He argued that the system of behaviours, norms, values, and rules that informally governs and gives meaning to the world of policing is more than just a personality or “way of being” but rather a “way of life”—a full-blown culture. Westley therefore more explicitly connected culture to the institution of policing.

Traditional police values are said to combine to create what has been termed by some authors as the “blue curtain” (Westley 1970) or the “blue wall of silence” (Bittner 1972). These phrases denote the boundaries within which the police operate according to an “us versus them” mentality. More specifically, they refer to the manner in which the police operate according to a protective “**code of silence**.” This code operates externally as well as internally to their workplace—that is, among coworkers and superiors but also in their dealings with the public and even during court proceedings.

### Keyword Spotlight: Code of Silence

**Definition:** “The unwritten rule of police behavior that constrains an officer from informing on or testifying against another officer ... animated by intense loyalty to the group, and mutual protectiveness against outsiders” (Smith 1973, quoted in Skolnick 2002: 10).

Parameters of the “code of silence” or “blue wall” are well documented. Loyalty to fellow officers is consistently cited as the key feature of the code, no matter the circumstances involved, including criminality. The code breeds strong group relationships and low rates of whistleblowing in policing, partly due to negative career impacts and the fear of retaliation from peers (Krinsky 2016; Westmarland 2005). Those officers who violate these prescriptive norms are cast as “rats,” untrustworthy, and ostracized. An informal “learning of silence” (Wieslander 2019) fuels the code, rendering its resilience a significant facilitator of police corruption (Skolnick 2002).

#### Example Cases:

- 1) Los Angeles Police Department (LAPD): The availability of video evidence at a time when recordings were exceedingly rare made the Rodney King police beating one of the earliest illustrations of the code of silence in action. Indeed, as many have argued, the attack would not have come to public attention if not for the videotape (Omi & Winant 1993; Skolnick & Fyfe 1993), and case witnesses and experts were met with intimidation and ostracization. The Christopher Commission (1991), launched in reaction to the King case, highlighted the cover-up practices of the LAPD: “The greatest single barrier to the effective investigation and adjudication of complaints is the officers’ unwritten code of silence; an officer does not provide adverse information against a fellow officer” (168).
- 2) Royal Canadian Mounted Police (RCMP): In recent years, the RCMP has come under significant criticism following a number of investigations into internal workplace practices, resulting in findings of a “culture of dysfunction” (Civilian Review & Complaints Commission 2017: 2) that gives rise to bullying and a abuse of authority, as well as sexual harassment and violence, and silences victims for fear of reprisal.
  - a) In 2017, the Civilian Review and Complaints Commission for the RCMP published a report examining workplace harassment in the ranks. Members who reported harassment experienced backlash, including being left alone at crime scenes, receiving threats from superiors to “behave” and being ignored when requesting backup (Civilian Review & Complaints Commission 2017: 15).
  - b) In 2020, former Supreme Court of Canada Justice Hon. Michel Bastarache released the Final Report on the Implementation of the Merlo Davidson Settlement Agreement, entitled “Broken Dreams, Broken Lives.” The Report details a “toxic culture” that “tolerates misogyny and homophobia at all ranks and in all provinces and territories,” as confirmed by the treatment endured by claimants, which included sexual misconduct, offensive language, and discrimination in promotion processes (Bastarache 2020: ii). Claimants also experienced “reprisal for rocking the boat” (45) in their attempts to break the silence of injustice, such as isolation, refusals to provide them with backup, and denial of special courses or training (86).

Once ambiguously defined using a variety of terms (i.e., “working police personality,” “blue wall of silence,” “cop code,” “thin blue line,” etc.), the “**police culture**” concept has become distinctly recognized as the term for describing the complex system of values and attitudes that define the normative social world of police officers. In a book titled *Politics of the Police*, Robert Reiner (1985/2010) outlined what he deemed the core elements that comprise this culture. In short, police officers are said (1) to actively pursue excitement (mission-action); (2) to

## Culture in Police Organizations

possess a cynical outlook and suspicion of others; (3) to strongly support solidarity with fellow officers; (4) to subscribe to conservative morality and politics; and (5) to exaggerate displays of masculinity (Reiner 1985/2010). Each is discussed in turn below.

*A. Mission-Action*

Common tropes are associated with police work. Police are the “line between order and chaos,” the ones who “run toward the danger.” The notion of crime-fighting is inherently adversarial, casting the work of law enforcement as a mission that requires a “warrior mindset.” However, compared to occupations in transportation, construction, and manufacturing, policing is not an especially dangerous profession. Criminologists have interrogated claims that there have been more attacks on police in recent times and found that policing is a safer profession now than in previous decades overall (White et al 2019). However, the symbolic representations and meanings that surround its mandate (“to protect and serve”) promote ritualistic affirmations that officers willingly “put their lives on the line every day.” This preoccupation with danger in policing does not match the evidence related to police officer fatality trends (Sierra-Arévalo 2021). Storytelling within policing thus plays a key role here (Hulst 2013), as members recount tales of what they encounter on the job “as means of entertaining each other... of coming to terms with troubling/traumatic situations, of warning others about the dangers inherent in police work, and of initiating and maintaining group identity and cohesiveness” (Fletcher 1999: 47).

*B. Suspiciousness and Cynicism*

To cope with the uncertain environments they navigate, police officers are said to develop a strong inclination towards suspicion (Skolnick 1966): they are explicitly trained in the art of spotting anomalies, sniffing out deception, and to be ready to act swiftly. This tends to “take the form of hard-bitten cynicism” (Waddington 1999b: 102) and ultimately results in a loss of trust

for others. Officers are socialized to expect to be dismayed by the segment of the public they will frequently encounter (what Van Maanen [1978] called “the asshole”), to be constantly lied to, and that they will receive little help from the public or the criminal justice system broadly (Fassin 2013; Moskos 2008; Rubinstein 1973; Worden 1995).

### *C. Isolation and Solidarity*

The combined effect of tropes of mission-action and suspiciousness is a sense that police can rely only on one another, which leads officers to be distant from the community. Owing to the coercive power and authority that are uniquely their own, newly sworn members of the police often begin trimming away at their social networks, reducing their friendship circles to those who will not test their virtue or place them in situations of needing to call out or act on petty crime in their midst (Campeau 2019; Karaffa et al 2015). Police are said to face a “lonely and largely friendless world” (Van Maanen 1974: 38), which further strengthens bonds with fellow officers—whether out of true camaraderie, obligation, or even exigency. The intensity of this connection is ultimately at root of the deep loyalty that is so fiercely protected within the ranks—an expectation that leads to sheltering coworkers from scrutiny and even to engaging in cover-ups to evade the investigation of colleagues (Waddington 1999a; Waddington 1999b). The seeds of police corruption can thus be found here (Punch 2009).

### *D. Conservatism and Authoritarianism*

Some studies have suggested that conservative and authoritarian views are more prominent among police officers in comparison to control groups (see, e.g., Baker 1985; Stack & Cao 1998). Brown and Willis (1985) found support for the idea that socialization of police recruits leads to increased levels of authoritarianism over time, while Laguna et al (2010) have found no such difference between experienced and inexperienced officers in this regard. What we might

## Culture in Police Organizations

consider more relevant to this trait than is an orientation toward politics that support and fund a “law-and-order” approach to crime and disorder (Loader & Mulcahy 2003). Police are critical of a perceived lenient justice system that allows criminally involved persons to avoid prosecution on legal technicalities or to receive “lenient” sentences.

*E. Masculinity (Plus: Heteronormativity)*

Police organizations are hyper-masculinized spaces, both literally, owing to a clear overrepresentation of men in this sector, and figuratively, as gender dynamics are continuously on display. Several of the above-listed features pair with “masculinized” beliefs and expectations such as risk-taking, aggressiveness, physical strength, secrecy, and competitiveness (Corsianos 2009; Fielding 1994). This aggregation of qualities gives policing its signature “brotherhood” moniker—a deliberately gendered reference.<sup>1</sup>

Implicit in the policing occupation’s emphasis on masculinity is the underlying theme of individual identities that differ not just from “masculine” but from the white male, heterosexual norm generally. Other axes of diversity such as race/ethnicity and sexuality cannot be disentangled from this core feature of police culture. However, much of what is known about racist or homophobic treatment within police organizations comes out of journalism and public inquiries, which are more focused on the whether and what of discrimination and harassment in this space and less focused on analysis of how attitudes toward diverse groups interact with

---

<sup>1</sup> It should be noted that literature about the role of gender in policing comprises a vast area within the criminology discipline. Space constraints do not allow for a full review of work relating to gender and police culture, but just a few other studies of note include: Garcia 2003; Franklin 2007; Martin & Jurik 2007; Morash & Haarr 2012; Silvestri 2017.

police culture.<sup>2</sup> In this regard, exclusively gender-based analyses, including those discussed below, are more common.

Studies examining the intersection of gender and police culture consistently report a key finding about the experiences of female officers: in essence, women in policing have few choices of “how to be” in the workplace. In a classic study by Martin (1980) that was later borne out by Rabe-Hemp (2009), female police officers were discovered to “do gender” on the job. They found that women can either adopt the POLICEwoman identity—which typically involves “doing masculinity”—or adopt the policeWOMAN identity—which involves performing femininity. The POLICEwoman adopts the language and manner of most policemen, stressing aggressiveness, suspicion, and competitiveness. Martin suggested that these women have chosen the path of “defeminization” (1980: 186), according to traditional gender norms. They remain loyal to male-oriented work values, no matter how unfair: POLICEwomen even adamantly refuse to be women’s representatives and ignore or deny other female officers’ complaints of discrimination for fear of being labeled a “women’s libber” (Martin 1980: 189). The POLICEwoman therefore often blames other female officers for the problems they encounter. As such, while on the job, POLICEwomen “do masculinity” to fulfill their occupational obligations without disruption from their disadvantaged female status. Martin also found that most POLICEwomen reported a shift in their behaviour once they were off-duty: “On the job, I’m strictly police. Off-duty, I’m more feminine... I’m an average woman” (193). The policeWOMAN, on the other hand, performs traditional notions of femininity. Martin (1980) argued that these women opt for “deprofessionalization” (186), according to the male perception

---

<sup>2</sup> An important exception where we do see analyses of how police culture influences attitudes toward diverse groups is in studies about the “code of silence” (discussed above) and how it limits people’s ability to report their mistreatment in the workplace.

## Culture in Police Organizations

of policing. Female officers therefore cannot be both “feminine” and professional simultaneously in the world of policing. The women in this group exhibit a disinterest in patrol work or making arrests and report being uncomfortable having to place themselves in dangerous situations. PoliceWOMEN indicate a preference for service-oriented work, which, according to them, is more compatible with their skills.

More recent research reveals the continued relevance of Martin’s 1980 study. Rabe-Hemp (2009; see also Garcia 2003) has performed a similar analysis using Martin’s framework, with similar results. She found that “generally, most female officers reported ‘doing gender’ in stereotypically feminine ways” (2009: 120), as they described themselves as particularly efficient in dealing with domestic matters. Moreover, women who support and socialize with other female officers are labeled an “estrogen mafia” and are “oftentimes further isolated from the police culture” (126). Rabe-Hemp has concluded that the similarities between Martin’s and her own findings thirty years later point to the strength of the masculine hegemony in police organizational culture.

New research by Bikos (2016; 2021) on female police officers in southern Ontario further supports the above findings. She has argued that the policewomen she interviewed experience a “bifurcated consciousness in how they view themselves and their world inwardly, compared to how they are forced to outwardly perform in their role as a police officer” (2016: 25). In other words, female police officers navigate a divided self. Since the world as they actually experience it—as women—is devalued by the hegemonic masculinized worldview they adopt as police officers, Bikos’ participants expressed feeling at war with themselves and even reported struggles with mental health because of this conflict (2021).

More recently still, Sanders et al (2022) have performed an in-depth analysis of the experiences of 91 female police officers from thirteen police services across Canada, including municipal, provincial, and federal jurisdictions. Their findings highlight the significance of “structured ambivalence” (Connidis & McMullin 2002) in how women police negotiate their “fit” in the hierarchical structure of policing. Structured ambivalence refers to the “contradictions and paradoxes that are imbedded in sets of structured social relations (e.g., class, age, race, ethnicity, gender) through which opportunities, rights, and privileges are differentially distributed” (Connidis & McMullin 2002: 565). Specifically, Sanders et al (2022) have mapped the strategic use of kinship narratives of the “Brotherhood,” the “boy’s club,” and “sisterhood,” as well as how women either mobilize or reject these, sometimes in conflicting ways, in order to navigate their place.<sup>3</sup> For example, participants articulated the “Brotherhood” as gender-neutral and as merely a unifying frame to capture the solidarity and protection that comes with being a sworn member. However, they simultaneously reinforced gender as a central characteristic to the Brotherhood when they shared about the ways inclusion is conditional on not challenging the men (e.g., not “crying harassment”) and *choosing* to “get on board” (Sanders et al 2022: 9) and to “deal with” the norms that come with membership. Exclusion happens through self-selection. As the authors have concluded,

In this way, the attention shifts away from larger questions about cultural and structural inequality embedded within the Brotherhood and instead toward the decisions that individual women make about their careers. The framing of the Brotherhood as gender-neutral is a neutralization process, whereby the gender coded expectations required for “fit” remain implicit and intact (Sander et al 2022: 10).

---

<sup>3</sup> This work by Sander et al (2022) is among research that applies cultural sociology to theorize and expand empirical investigations of police culture (see Section III). However, it is included here for its substantive focus on the experiences of women police in Canada.

## Culture in Police Organizations

Herbert (2001) has offered another example of how gender interacts with police culture even through broader operational imperatives to shift law enforcement away from its prevailing masculinism and toward a more inclusive, cooperative approach—namely, community policing. Drawing on field data from observations of the Los Angeles Police Department, he has found that officers do not classify community policing as “real police work.” Women’s communication skills are glorified as particularly apt for community policing, and this in turn has led to the notion that men are not as well-suited for such tasks. Thus, a discourse that was meant to encourage the participation of women in policing has served to “feminize” the new model (Herbert 2001; see also McCarthy 2013). Since community policing cannot completely replace law-and-order tactics used in law enforcement (i.e., tactical units, drug squads, etc.), it is merely viewed as complementary. By extension, female officers are also viewed as complementary because community policing has become associated with “female skills.” Masculinist “hard chargers” who prefer the “real police work” (Herbert 2001: 59) of catching bad guys distinguish themselves from “station queens,” who do the “social work” of community consultation (56).<sup>4</sup>

While rarer in the literature on police culture than the topic of female officers, studies about the lived experiences of LGBTQ police officers do exist (Burke 1994; Colvin 2015; Couto 2018; Jones & Williams 2015; Miller et al 2003). This body of work shares much in common with the research on policewomen: LGBTQ+ police officers also live dual lives. For example, Burke (1994) has argued that an LGBTQ police officer’s capacity to “be open” in an occupation where “homosexuality is deviance” produces double as opposed to integrated lives, with significant implications for mental health. Couto (2018) has offered a recent Canadian case study of the perceptions of LGBTQ sworn members in Ontario. A majority of his sample (N=21)

---

<sup>4</sup> A conceptual framework for this discussion is offered in section III below, with emphasis on how “boundary work” reinforces the classifications people use to demarcate themselves from others.

believed their status in the workplace had improved from previous eras and that junior colleagues were generally less condemnatory of identities outside the heterosexual norm. However, Couto's (2018) respondents agreed that machismo remains strong in policing and reported facing micro-aggressions at work, such as inappropriate jokes (see also Bastarache 2020).

*F. But There Is More to This Subject: A Caution*

The combination of the traits described in the previous sub-sections is best interpreted as an "ideal-type": a synthesis of police values and perspectives into a unified analytical construct. Since Reiner's early contribution, many studies have confirmed the pervasiveness of these core characteristics (see Paoline & Terrill 2014). In an oft-cited ethnographic account of an English police force, Loftus (2009) revealed the remarkable durability of nearly all of these themes. Her findings reinforce that police culture is often presumed a monolith because, it is argued, key features of policing remain largely unchanged: police are appointed a unique position in the law, hold a monopoly on the sanctioned use of coercive force, and are obligated to perform society's "dirty work" on a routine basis.

However, it has been argued that the common approach to studying police culture has led to "cognitive burn-in" (Sklansky 2007); the template of Reiner's "ideal type" now serves as a collective imprint in how researchers even come to think about the topic of police culture (see also Waddington 1999a), and these preconceptions are difficult to dislodge. Sklansky (2007) has cautioned that cognitive burn-in has the effect of diverting our attention from new directions and emerging trends relating to the study of culture in policing. To be sure, Reiner himself cautioned that police culture "is not monolithic, is embodied in individuals who enjoy autonomy and creativity" and that variation "can be discerned within the broader police culture, generated by distinct experiences..." (2010: 116). And so, while classic renditions of police culture remain

highly relevant, as are elements of the ideal-type reaffirmed in even the most recent of police research, the analytical terrain of “police culture” scholarship has begun to expand.

### 3. “Police Culture” Expanded

The earliest works credited with demarcating clear variation in “police culture” took a rank-based or hierarchical approach. In other words, these works highlighted what we might more accurately call a *subcultural* approach within policing. For instance, Reuss-Ianni and Ianni (1983) distinguished “**street cop culture**” from more impersonal, business-oriented “management cop culture.” They argued that the two no longer share common language, work experiences, backgrounds, ideologies, objectives, or communicative channels. In short, typical descriptions of the police occupational culture represent only a certain sector of police forces, which is working class in origin and whose members see themselves as career cops who wish to be left alone to do their job in an informal, personalized environment based on “esprit de corps,” experiential street sense, autonomy, and loyalty (1983: 5). In the spirit of the “good old days,” street cops openly speak against what they consider to be preferential treatment of minority officers (through recruitment or promotion) and dislike civilian employment in “police jobs” or anything to do with fostering community–police relations through what they believe is “bull shit” social work (1983: 6). These narratives persist among patrol officers today. Studies show continued pessimism about minority preferential treatment and the civilianization of police service (Atkinson 2013; Campeau 2019), as well as frustration around the policing of broader social problems that do not fall within the parameters of criminal law enforcement (Herbert 2001).

Often in conflict with street cop culture is **management cop culture**, which operates within the upper echelons of police organizations. Management cop culture is shared by

members in superior administrative positions whose higher education and middle-class backgrounds make them eligible for high-ranking promotions in the department. They value respect for the chain of command and believe that disciplinary measures are important tools for shaping accountability among the rank and file. These officers are also sensitive to limited departmental resources and make decisions with an impersonal “business” attitude. Furthermore, management cops must be attuned to the political, social, and economic constraints that exist outside the police organization and how these impact the daily operations of the department (Reuss-Ianni & Ianni 1983). Manning (1995) has posited the presence of a broader police culture whereby certain expectations about core skills and cognitions do exist in order to define “good police work” but like Reuss-Ianni and Ianni (1983) he has also elaborated that, within this broader culture, subcultures exist that are often hierarchically specific.

A review of literature yields a dearth of research on management culture in policing. However, we can “read in” the role of culture in a number of studies about police leadership. For instance, in an article aptly titled “Rank Matters,” Davis (2020) has drawn on a case study in the United Kingdom to develop a “situated authority model of leadership” (SAML). Put simply, the SAML captures how police leaders wield and negotiate rank differently—through its “doing” (emphasizing hierarchy) and “undoing” (downplaying rank)—depending on the circumstances at hand. Among situations that warrant “doing” rank, two are of particular note for this report: (1) high-audience situations and (2) high-risk scenarios.

High-audience situations are public encounters or highly visible spaces, typically involving powerful outsiders. For example, in public accountability forums with the Police and Crime Commissioner, the conventions and formalities of rank are clearly adhered to, and the performance of rank is evident. In a management position, rank can be used as a “display for

## Culture in Police Organizations

persuading the audience” (Goffman 1959). High-risk scenarios, in contrast, are critical or emergency situations, with public order and firearms incidents being among the most commonly cited examples. Under these conditions, there is strong attachment to the rank structure, which is perceived as useful for demarcating roles and responsibilities and clearly allocating decision-making. The centrality of rank in high-risk situations shapes the expectations of leadership in that environment.

Davis’s interview participants also discussed risk more broadly as threats to the public, personal or colleague safety, and reputational risk to the police department (Davis 2020). The way Davis has woven the protective effect of “time” with evaluations of risk is also relevant. The structure and authority of rank is used to facilitate urgent action (Davis 2020). If a situation is perceived as non-pressing or is evolving slowly, it is safe to challenge traditional conventions, thus facilitating greater autonomy (or discretion) among the rank and file. The flow of information feeding this perception is therefore of critical importance.

Davis (2020) has further argued the “doing” of rank is particularly salient in assumptions related to decision-making. Decision-making is positioned “upwards” toward the upper ranks of police organizations, and this provides a sense of protection and reassurance referred to by police officers as “top cover.” Officers in the lower and middle management ranks discussed the conventions of “reverting back” to hierarchy to keep senior members informed “just in case” (Davis 2020: 452). Leaning on rank structure is how some officers respond to risk and can be a strategy for dealing with a fear of the consequences of making mistakes. Furthermore, the perceived legitimacy of decision-making is not equally distributed across the police but rather assigned on the basis of seniority (Davis 2020). This practice is so entrenched that rank trumps knowledge or expertise when members confer legitimacy onto decision-makers. In short,

knowledge is not understood as separate from rank but rather through the “lens” of rank. The implication of Davis’s (2020) findings are that rank—and all of the institutional clout, resources, and command that come with it—matters and is deployed conditionally by police.

The existence of “rank-based” accounts of police culture is perhaps unsurprising, given another hallmark of twenty-first century policing: **paramilitarism**. North American policing is characterized by what Peter Kraska (2007) has described as a rapidly blurring distinction between military/police, war/law enforcement, and internal/external security. Despite widespread declines in crime since the 1990s (Moreau 2021), consistent evidence that invalidates the standard “crime fighter” model of policing (Weisburd & Eck 2004), and a three-decades-long shift toward community-based policing principles (Cordner 2014), police departments remain paramilitary in their structure and in the framing of their mandate. Police organizations adhere to classic theories of administration described by Weber (1947), emphasizing rank-based relationships, centralized chain-of-command structures, hierarchical communications whereby information travels upward and orders flow down, and obedience. Moreover, at the level of police knowledge management, policing’s paramilitary structure is arguably the most salient characteristic that contributes to a siloed approach to information-sharing and public service (Chan et al 2022). For instance, Abrahamson and Goodman-Delahunty (2014) have studied the information-sharing impediments in three Canadian police departments and found organizational structure (i.e. hierarchy configuration, communication patterns, and policies) and organizational culture (defined here as individual attitudes, values, legitimated standards and norms) are most significant (see also Sanders & Henderson 2013).

The trappings of paramilitarism are evident from the very beginning of a police officer’s career, with police training “academies” or colleges replicating military-like experiences and

## Culture in Police Organizations

environments. “Cadets” or “recruits,” as they are often called, practice drill and formation, stand at attention, and are even trained in the art of proper boot-polishing methods. While such practices may seem trivial, merely symbolic, or even “ceremonial,” when coupled with titles of rank (e.g., sergeant, captain, etc.), the use of military hardware and weaponry, and deployment of “tactical units” for priority calls (Roziere & Walby 2017), such paramilitary signifiers play a role in how police officers conceptualize their role. The “war on crime” analogy that paramilitary practices evoke “enemizes members of the community and fortifies the ramparts of the righteous” (DeValve 2020: 140). If police are trained like soldiers and citizens are perceived as unlawful or threatening, then the two become enemies; and in war, enemy threats must be neutralized (Kraska 2007; Williams 2015). In the context of criminal justice, Shelden and Vasiliev (2018) have referred to this mindset as “controlling the dangerous classes.” As a case in point, in a recent study on police culture in a Canadian city, a motivational pep talk by a Deputy Chief to the morning patrol shift included the sign-off “Now let’s go out there and fucking kick their asses!” (Campeau 2019: 77).

The RCMP provides a clear example of police paramilitarism. Indeed, the origins of Canada’s federal police body are historically embedded in a colonial paramilitary tradition of westward expansion and taming the “wild” frontier (Madsen 2020). While the colonial roots of policing in Canada and the role of the police in longstanding and ongoing conflicts with Indigenous communities are beyond the scope of this report, it is important to note that police paramilitarism looms large as a remnant of the settler-colonial history (Nettelbeck & Smandych 2010; Bell & Schreiner 2018). Paramilitarism remains a core structural and cultural feature of policing in the twenty-first century.

### III. Sociology of Culture

Why look to the sociology of culture to inform the study of policing? The answer is simple: for both theoretical and methodological rigour for addressing culture-related questions. A review of literature suggests that police studies alone are not an adequate source of theoretical equipment for assessing culture explicitly (see section I above).<sup>5</sup> One clear limitation is the tendency of police studies to test and retest with an eye for the “core characteristics” of police culture described in classic renditions. The answer to whether these characteristics persist among the police is likely to remain in the affirmative: following this approach almost invariably leads to confirmation of the ideal-type. Rather than an all-determining and unchanging feature of a community, cultural sociologists adopt a multifaceted and “practice-oriented” approach to the study of culture. This research emphasizes empirical analysis of how individuals perceive and act upon their environments by creatively drawing from various cultural resources, depending on the setting and situation in which they find themselves. For example, is culture interrupted during moments of crisis in a workplace? Do newcomers import new ways of making sense of a problem? Concepts within the sociology of culture account for unpredictability and shifts in organizations and group settings. Studying culture in this way permits greater fluidity across time and space—in short, it recognizes the dynamic nature of culture and can account for change.

Anthropological and sociological understandings of “culture” can largely be traced back to the work of Clifford Geertz, who shifted focus onto *meaning* and the ways in which culture sets a “mood or tone ... to daily life through its symbolic vocabulary and through the ritual experiences it makes available” (Geertz 1973: 5). The work of Pierre Bourdieu (1977) was also central to the shift toward understanding culture as *practice*—that is, understanding culture by

---

<sup>5</sup> See also Chan (1997); Crank (2004); Shearing & Ericson (1991); and Waddington (1999a) for critiques of how the concept of “police culture” has been defined in the past.

## Culture in Police Organizations

examining the various ways in which it is used as though a tool rather than as viewing it as some grand “way of life.” This section reviews relevant research that engages this definition of culture-as-resource, particularly in moments of uncertainty. It also describes some key “ingredients” of culture, such as schemas, frames, and boundaries, and how these inform social life. Applications to policing are explored where applicable: some parallels are embedded in empirical research, while others are drawn conceptually by the author for useful analogizing.

### 1. Culture in Unsettled Times

Swidler (1986; 2001) famously argued that the best time to uncover culture is during moments when lives are “unsettled.” In settled times, “culture is intimately integrated with action... [C]ulture and structural circumstance seem to reinforce each other” (Swidler 1986: 278), and because of this, implicit ways are obscured as “tradition” or even “common-sense.” As such, the relationship between culture and action looks quite different in these two moments. In settled periods, the influence of culture on action is quite independent because institutionalized taken-for-granted strategies or habits remain unchallenged. In Swidler’s terms, the relationship looks this way because the cultural repertoire limits the available range of responses. Situations are not varied enough to warrant alternative lines of action. In unsettled times, in contrast, the causal relationship between culture and action remains, but with the intervening influence of ideology, according to which *new* strategies for action are determined. Which ideology prevails depends on historical and structural constraints, but the main point is that ideology is made explicit in unsettled times as “competing ways of organizing action are developing and contending for dominance” (Swidler 1986: 279).

Elsewhere, I have used this line of thinking to explore the effects of increased oversight as a generative moment to shed light on how police officers produce cultural meaning about their work (Campeau 2015). Drawing on 100 interviews and participant observation in a police department, I have studied how officers negotiate meaning in an unsettled occupational environment prompted by intensifying accountability and public visibility. Specifically, I have examined two pillars of classic definitions of “police culture” discussed in the previous section: solidarity and mission-action. However, where I depart from criminological thinking on “police culture” is to reconceptualise these not as set values or attitudes presumed to channel behaviour in predictable ways but rather as resources to bring justification to experience. Cultural sociologists warn that values and goals alone cannot motivate people because we hold values (e.g., a healthy, sustainable environment) that are often inconsistent with the decisions and actions we pursue (e.g., failing to recycle) (Swidler 1986). I have highlighted how solidarity and mission-action serve instead as cultural resources that get appropriated (or inverted) in various ways within a definable set of structuring conditions—in this case, growing oversight of police work (Campeau 2015). In doing so, I have shown that solidarity is not so unyielding as common value depictions of police culture suggest. For example, accountability mechanisms unearth new ways of asserting and negotiating solidarity altogether, with many officers casting scripts about solidarity in a negative light, as detrimental to one’s job security:

You can’t be a cowboy out there anymore, so I think with all these different avenues for people to complain, and all these ways that they’re checking up on us... you hope your partner is on the same page as you because the last thing you need is your partner to do something stupid and you’re there, and then what are you going to do, right? And then it’s difficult because, I mean, you’re working for a big team and you want to look out for people, but now it’s like, well, if you did something stupid, my hands are tied. I can’t... what are you going to do? And even when I started it was kind of, like, alright, well, how are we going to say this went down because we got to make sure this goes smoothly. Like now—whatever went down, that’s what went down because you’re on camera and you did this... You want me to lie and say that you didn’t

## Culture in Police Organizations

do this, or he took a swipe at you first? There's a camera right there. You know, we're like, "What are you doing?" So you hope that you got someone with a level head (Constable G, in Campeau 2015: 679).

Moreover, mission-action as a means to making sense of the occupational field of policing loses ground in an age of intense public scrutiny. Instead, police draw on cultural scripts about risk and avoidance because these are better suited to navigating their current circumstance:

Now it's completely different. I spend my days trying to stay out of trouble, then serve the public, then look out for my partners. In fact, that's not even right. I spend... the first thing is... I don't want to get in trouble. I don't want to get nailed by somebody with a camera phone or by our own service, and then I have to take care of myself [emphasis]. And then I have to take care of my partner, and then the community... [Accountability] has swung so far in the other direction now. It's gotten to the point of ridiculousness; and I go to work and, like I said, I just spend my days not trying to get in trouble. People tell me fuck off, and I do. And it breeds... "Oh, I don't care. Those two guys are fighting. Alright, well, I'm not getting involved because, you know what, then something will happen. I'll break it up; break a guy's arm trying to break it up, and then they'll have SIU coming down here and they'll investigate me" (Constable A, in Campeau 2015: 681).

My analysis does not contradict the descriptors that make up the police culture ideal-type that is so prominent in criminology but rather empirically captures the contextual nuances so commonly alluded to in research disclaimers. Indeed, core features of policing such as mission-action, isolation, solidarity, and machismo seem to stand the test of time (see Loftus 2009), but findings to such effect are often followed by reminders from researchers that these characteristics waver at the individual level and across groups facing divergent roles or environments (Ingram et al 2013), that attitudes and actual behaviours are inconsistent (Waddington 1999a), and that future research should endeavour to reconcile these issues (Cockcroft 2007). Thus, what is needed is an account of the "when and where" particular sets of meanings will be linked to experience. Sociology of culture fills this gap.

## 2. Cultural Schemata and Frames

The study of schemata was once central to the fields of cognitive psychology and anthropology (d'Andrade 1995; Casson 1983; Strauss & Quinn 1997). Since then, however, much common ground has also been unearthed between sociology of culture and psychological perspectives (Cerulo 2010). Within the overlap is a shift toward emphasizing the ways in which “cultural frames or understandings may be situationally cued” (DiMaggio 1997: 265). As we will see below, schemata and frames help us understand something about culture in moments of ambiguity.

Beyond the psychological attributes of cognition, pairing culture and cognition has provided a space for theorizing the role of cognitive mechanisms in how meaning is drawn from signals embedded in a physical and social environment (Strand & Lizardo 2015). Our routine everyday cognition relies heavily upon “**cultural schemata**”: shared knowledge structures that represent objects, types of people or events and provide default assumptions about their characteristics, relationships, and entailments under conditions of incomplete information (DiMaggio 1997: 269). Schematic thinking is like “personal culture” (Lizardo 2017)—a retainer of experiences reformulated into algorithms for action that highlight parts of situations that are salient to individuals for their own behaviour and for how they make sense of the world. Repeated embodied (i.e., perceptual, sensorimotor, interactional) experiences lead to neural associations that are stored in long-term memory. People then perceive future events in ways that are consistent with the existing schemata they trigger. Cultural schemata do not operate solely through the unconscious as cognitive construct; rather, they are capable also of motivating behaviour with strategic purpose (d'Andrade 1995; Vaisey 2009). The framework of cultural schemata thus explains how culture is absorbed by individuals moment to moment and then put back into the social world via action.

## Culture in Police Organizations

For instance, Brubaker et al (2004) have studied how schematic thinking informs people's classifications of ethnicity, race, and nationhood, as well as the categorical boundaries these impose onto the world. They have defined schemata as "templates for representing and organizing social knowledge, frames for articulating social comparisons and explanations, and filters that shape what is noticed or unnoticed, relevant or irrelevant, remembered or forgotten" (Brubaker et al 2004: 47). Therefore, "ethnicity as cognition," they argue, means humans rapidly perceive differences in appearance as being important, imbuing physical traits with deep meaning and producing inferences about groups of people. Indeed, Brubaker et al (2004) have noted that schematic thinking goes beyond mere perception to "interpret experience, general inferences and expectations, and organize action" (41). They have not suggested that racial prejudice is inevitable but rather that people routinely "identify persons, actions, threats, problems, opportunities, obligations, loyalties, interests and so on in racial, ethnic, or national terms rather than in terms of some other interpretive scheme" (Brubaker et al 2004: 37). For example, we do this when we explain voting patterns in terms of racial or ethnic loyalties; when we identify an expression as an ethnic slur; when we analyze certain forms of collective action or social movements: "in these and innumerable other situations, we make cognitive assumptions about the way in which people parse, frame, and interpret their experience" (Brubaker et al 2004: 37). Moreover, the authors have pointed briefly to the relevance of this for how schemata inform police "racial profiling," particularly in moments marked by ambiguity.

The study of cultural schemata is useful for examining frontline work in law enforcement because police officers are required to work under conditions of uncertainty and assess complex and unpredictable situations before taking rapid action. To be sure, police studies have grappled with similar ideas, using a variety of descriptors to denote what that literature has called a police

“sixth sense.” “Intuition” (Bittner 1972; Pinizzotto et al 2004), “suspicion” (Crank 2003; Skolnick 1994), and “common sense” (McNulty 1994; Van Maanen 1974) represent a few other terms used to specify a tacit knowledge said to heighten an officer’s sensitivity to danger and strengthen one’s ability to identify wrongdoers.

Analyzing a so-called police “sixth sense” as a cultural schema has the potential to bring the study of tacit knowledge forms in policing under a single unifying theory. A growing body of police research also focuses on the development of automatic cognition for defensive response through repetition in tactical training, as well as increased use of “implicit bias” tools to limit discrimination, especially racial profiling, in policing. However, a key limitation of these approaches to studying schemata (mainly through experimental design) is the inability to capture significant complexities brought on by the real-world personal interactions and settings in which schemata are activated. These works, while valuable to the field of law enforcement do not explicitly address the *cultural* relevance of such cognitive adaptations.

Wood et al (2018) have offered a useful distinction between schemata and **frames** that can help policing scholars apply these concepts in their efforts to better understand how culture informs officer behaviour. The authors have defined a frame as “a situated assemblage of material objects capable of activating schemas” (Wood et al 2018: 246). In short, if schemata are about personal culture (internal cognitive process), then frames are the public culture (external; situational or material) that evokes schemata. Frames can include physical objects and settings, as well as sounds, human and nonhuman bodies, texts, and conversations. Applied to policing, we can look to the ways frames evoke schemata in the course of routine patrol. Crank (2004) has argued that in each interaction with the public, police officers observe possible indicators of criminality in a person’s dress, overt behaviour, and subtleties in physical comportment, as well

as in the immediate surroundings. Such cues signal either conformity or a distinction worth investigating further—that something is “out of place” (Çankaya 2020). Over time, such observations become “perceptual shorthand” (Weenink 2009: 222) for suspiciousness, and repeated use thereof is passed on through the rank and file as “common sense.” A dark alleyway in a high-crime neighbourhood activates a set of schemata different than those activated by a suburban cul-de-sac, and the indisputable existence of systemic racism throughout the criminal justice system suggests that a young Black or Indigenous male will activate different schemata than a middle-aged white woman. For this very reason, Crank (2004) has argued that racism is entrenched within the culture of policing, not necessarily because each individual officer is importing overtly racist attitudes (though some are) but because there are cultural forces at work—or to employ the language of cultural sociology, cultural resources being used—that normalize discriminatory practices (see also Brown & van Eijk 2021).

### 3. Boundaries

Another key “ingredient” of culture that social scientists study—one that Durkheim (1965) invoked in *The Elementary Forms of Religious Life*—is “boundaries.” Durkheim contrasted the realm of “the sacred” to that of “the profane” to denote basic categories humans create to organize their world. The underlying notion here is that culture is always both inclusive and exclusive, and boundaries are the mechanism through which categories are formed and maintained. In cultural sociology, this conceptual process is referred to as “**boundary work**.” Specifically, boundary work refers to the classifications that individuals and groups construct to demarcate themselves from others in order to gain resources and legitimacy (Lamont 1992).

For example, in *The Dignity of Working Men*, Lamont (2000) has examined the operation of “boundary work” in the worlds inhabited by working class men in France and the United

States in the early nineties. Through in-depth interviews, she discovered how men perceived social hierarchy and “construct similarities and differences between themselves and other groups” (2000: 3). The main concern for these men was sustaining “moral order” in their lives, which white male workers achieve by emphasizing their “disciplined self” and African-American male workers accomplish by crystallizing their “caring self.” By carving out their own sense of self-worth in relation to others, white and black working men establish boundaries that differentiate them from others who they classify as “lower” on the morality scale: the “disciplined self” stresses an individualistic altruism, while the “caring self” focuses on collective dimensions of virtue, like solidarity and egalitarianism (Lamont 2000). According to the black workers in Lamont’s study, white men are selfish, sneaky, and not family-oriented enough; and according to the white workers, black men are not self-sufficient and often lazy (Lamont 2000).

The question of how individuals establish conceptual divides among themselves has become important for sociologists interested in social and collective identity; class, ethnic/racial, and gender/sex inequality; the professions, knowledge, and science; nationhood/citizenship; and spatial boundaries.<sup>6</sup> In this effort, Lamont and Molnár (2002) have drawn an important distinction between “symbolic boundaries,” which take on a conceptual, metaphoric, or subjective form, and a material, objective form they call “social boundaries.” Symbolic boundaries are “conceptual distinctions made by social actors to categorize objects, people, practices, and even time and space... [T]hey are tools by which individuals and groups struggle over and come to agree upon definitions of reality” (2002: 168). Durkheim’s (1965) distinction between the sacred and profane, or working men equating moral character with self-discipline to

---

<sup>6</sup> Lamont & Molnár (2002) have provided a comprehensive review of the study of boundaries in the social sciences.

## Culture in Police Organizations

demarcate oneself from those who are “lazy” (Lamont 2000) fall within this category. Social boundaries, on the other hand, “are objectified forms of social differences manifested in unequal access to and distribution of resources and social opportunities” (Lamont 2002: 168). Symbolic boundaries can become so firmly agreed upon that they can “solidify,” becoming socially ingrained, and in turn begin to constrain social interaction along very exclusionary patterns (Lamont & Molnár 2002). Among the most glaring examples of solidified boundaries on a structural scale is racially segregated neighbourhoods.

This conceptual framework further provides a space to consider variation. After decades of research on how “working men” construct a sense of self, define cultural membership, and draw boundaries in their communities, Lamont’s findings support the notion that no singular, all-encompassing way of life or culture shapes people’s actions (Lamont 1992; Lamont 2000). Rather, certain cultural patterns of self-identification are simply more prominent in one setting than in another, thereby underscoring the fact that individual agency is circumscribed by boundaries as well as by the differentially structured contexts in which people live. One could argue that, in light of so much emphasis on the persistent and insular nature of “police culture,” the institution of policing is a setting where such cultural patterns are especially prominent. In other words, the individual agency of a police officer is heavily circumscribed by their occupation; they hold unique powers relative to other kinds of public service, their authority within the workplace is constrained (or enabled) by rank-based classifications; and the field is historically and presently dominated by a single demographic group (white men). Indeed, boundaries are highly relevant in spaces and relationships where lines of division create power imbalance and where people have a vested interest in competing for material resources (e.g., promotion) and symbolic resources (e.g., status).

“Boundary work” is a concept that has rarely been explicitly applied to policing—an institution that has nonetheless long been associated with boundary-related metaphors in popular culture and scholarly literature. For example, the “thin blue line,” the “blue wall,” “brotherhood,” and the “us-versus-them” mentality all denote the boundaries between police and a posited ordinary public. By applying the theoretical construct of boundary work to policing, we may better grasp how officers maintain distinctions between themselves and “outsiders,” which may include the public, stakeholders in other public-sector agencies, or those within their own ranks who do not qualify to meaningfully participate in the so-called brotherhood. In each of these cases, which are examined below, these may also reflect symbolic boundaries crystallized into social boundaries.

#### *A. Boundaries between the Police and the Public*

The idea that police erect boundaries to distance themselves from members of the public is documented in some of the oldest police literature, highlighting the isolating nature of the occupation (VanMaanen 1974; Westley 1970). Skolnick (1966) described “an exceptionally strong tendency to find [the policeman’s] social identity within his occupational milieu” (52). Specifically, it is said that the coercive authority granted to officers promotes a divide between them and the people they police, friend or foe. In fact, my own field work has revealed that patrol officers even use designations like “anti-police” or “friendly” to describe certain known residents who have criminal records and include these qualifiers in their report notes to alert coworkers who will encounter them again in the future. The need to “keep the edge” over citizens prompts suspiciousness and a tendency to mistrust (Manning 1995).

Furthermore, it has been shown that officers generally do not believe that any outsider can assist them in carrying out their duties because only sworn members can truly know what it’s

like to perform their job (Campeau 2019; Sparrow et al 1990). For example, du Pleissis et al (2020) have found that police frequently invoke a metaphor of kinship to denote those who are within and without the “blue family.” It is believed that “blueness”—a colour associated with policing—can only come from knowing the burdens of wearing a police badge (Sanders et al 2022). This mentality thus leads to police officers doing “boundary work” in their personal lives, potentially leading police to prefer the company of co-workers (Karaffa et al 2015). It also spills over into their dealings with relevant others working in the public sector, including lawyers, judges, social workers, firefighters, paramedics, municipal officials (e.g., city councillors), academic researchers, and data analysts (Sanders et al 2015). Agencies in the domain of public health and safety are especially siloed; boundary work is imposed in an official capacity through directives for stringent privacy guidelines and formal barriers to intelligence-sharing.

*B. Boundaries between the Police and “Non-members” within Their Ranks*

Boundaries are also erected by officers within their own working groups. Police studies underscore several categories of demarcation (such as those discussed above in section II), including “street cops” versus “management cops” or gender-based typecasts (e.g., “POLICEwomen” versus “policeWOMEN”; “hard-charger” versus “station-queen,” etc.). However, researchers know less about how police *themselves* articulate and engage symbolic and social boundaries in their workplace. Just as Lamont has identified morality and self-reliance as “the most salient principles of classification and identification that operate behind workers’ evaluations of worth and social hierarchies” (2000: 4), the same can be done to identify those that influence police perceptions of the institutional hierarchy in the service and officers’ beliefs about why certain members violate their normative obligations.

Elsewhere, I have examined how several axes of classification come together in a unifying framework, highlighting the role of “generational boundaries” and the distinctions that come with these (Campeau 2019). For instance, “old school” officers, as referred to by study participants, lean into this qualifier and perpetuate symbolic boundaries in ways that help preserve the status quo in policing. They emphasize the importance of “traditional” police values around paramilitarism, deference, teamwork and conformity, the dangers of entitled young people, a “tough town” mentality, and the significance of sport and camaraderie. Those holding these views are also the most critical about targeted hiring policies meant to diversify the racial, ethnic, and gender composition of police personnel. “New generation” officers, in contrast, enter a field that is marked by increasing professionalism, oversight, and diversity in officer backgrounds. As such, these individuals dismiss “old school” views and demarcate themselves from “old-minded people” who did not police the public at a time when intense scrutiny, camera phones, and social media were a pervasive part of work life. These generational boundaries are not necessarily grounded in age but are rather symbolic, sustained through the routine adoption of old and new cultural scripts available for use in the occupational field of policing (Campeau 2019).

#### **4. Other Policing Applications**

Two key studies are worth noting for the connections they build between cultural sociology and the institution of policing to help us understand officer discretion and decision-making. The first is my own work (Campeau 2018), which centers on how officers engage with formal policies and standards for police protocols. The second, by Brown and van Eijk (2021), is concerned with the role of “thought styles” in routine police–public interactions. Each is discussed below. Where the two meet is in their explicit examination of the socially embedded qualities of police work:

## Culture in Police Organizations

how local and situational contexts interact with micro-level practices, interactions, and meaning systems. Moreover, a clear takeaway from each set of findings is that officials would be hard pressed to bring about institutional change through top-down policy, even though top-down directives are the primary avenue chosen to bring about such outcomes (Duxbury et al 2018). As the studies show, bureaucratic, policy-based imperatives are interpreted and engaged strategically, either to better reflect the cultural resources that are available to a particular group or community or to better suit what situational exigencies demand.

*A. Standards and Cultural Match: Policing is Locally Embedded*

In a study of the police in an Ontario city (anonymized as “Blueville”), I have shown how individual officers strategically use narratives about uniqueness to describe what they called “the Blueville way” (Campeau 2018). These narratives were employed by officers to perform, justify, and sustain a sense of nonconformity with political efforts to standardize provincial police services (Campeau 2018). The analysis does not focus on whether the organization is in fact unique (it is likely not) but rather aims to demonstrate how *perceptions* of uniqueness are powerful generators of culture when they are used to make sense of one’s work. I take standards themselves to be a cultural resource in order to account for the significance of **cultural match**, which refers to the congruence between a society’s formal institutions of social control and dominant cultural norms (Cornell & Kalt 2000; Swidler 2013). My findings support the idea that perceptions and practices are driven by meanings drawn from the social context in which an organization is rooted, thereby impeding full compliance with industry standards that are seen as locally incompatible or “mismatched.” The following are illustrative quotes from my analysis on: (1) the relationship between sociopolitical and economic context and the approach of officers

to interacting with Blueville residents; and (2) the enactment of the “Blueville Way” as a means of side-stepping legislation (Campeau 2018).

Economy wise, that has something to do with the way we are. It’s always been a blue-collar town, and people aren’t afraid to tell you what they think. I lived in Ottawa. I came here and got a big wake-up call! People had their mouth full of shit up there, only they wouldn’t say it. Here you’re going to get it! Coming from there and coming here, holy shit! Just the different cultures. You have to police your city the way the culture of the people is, and you take a different approach with a white-collar [city] than a blue-collar [town], and I think that’s got a lot to do with it. It has to! Say what’s on your mind and do what you got to do, right? I think people have that attitude here. It comes with the factories and that type of work (Sergeant Clayton,<sup>7</sup> in Campeau 2018: 619).

Blueville always had that blue-collar mentality . . . the autoworker. So, I think people in Blueville, for good or bad, expect that. It’s something I’ve adapted to being here. You talk to people like you’re from Blueville. It’s an unwritten understanding here, I guess. I didn’t get any of that growing up in Toronto. They’re more accepting of me being, “Hi how are ya,” like I would be talking to a friend or neighbor. I’ve worked in different areas of the city, and it doesn’t matter the socioeconomic . . . well whether it’s west end, east, or south, it seems you gotta approach people the same way. It’s more of a home-towny approach. That’s why I call it an unwritten thing. My sister [an officer in western Canada] always says that her experiences are completely different from mine. We compare notes. I think what works here in Blueville wouldn’t transfer in other cities and vice versa. If someone came here that was formal or stiff all the time, they wouldn’t be able to relate to the people of Blueville (Constable Cliff, in Campeau 2018: 618).

Having a Feeney Warrant before going to someone’s house to arrest them . . . the Blueville Way would be, “What do I need a Feeney Warrant for? I’m going to comb the street until the guy comes out; if he steps on the edge of his property, my report is not going to say that. It will say he was on the street.” You know? We have our strong-armed way of doing things (Sergeant Colleen, in Campeau 2018: 612).

Under the Criminal Code, section 31 is Breach of Peace, which is not a criminal charge; it’s a process. So, if I go to a scene and everybody is screaming and going crazy, rather than arrest you for causing disturbance, I may lock you up for Breach of Peace because it’s a one-page report, and I release you in the morning once you’ve sobered up. So, it’s a way to handle it. We use that often. Well, other [police] services very rarely use that section of the code. If they bring you in, it’s for a solid charge that’s going to court, and you have to face a judge . . . which requires a more detailed report—get statements, interview people. There’s much more involved. Well, Blueville—we’ve always done the shortcut. We’ve just done Breaches of Peace and away you go. It solves the

<sup>7</sup> Study participants are anonymized; names are pseudonyms.

## Culture in Police Organizations

problem to some degree, and it's been tolerated here. Other agencies, they don't tolerate that (Sergeant Lauren, in Campeau 2018: 612).

My findings show that cultural match matters. The above quotes underscore how the perceived uniqueness of the Blueville Way is informed by the cultural meaning members attach to the local milieu, which in turn reproduces a fierce belief in a mismatch between their industry's standards and their own needs as a public service institution. Culture therefore serves as "the glue that holds a society's formal and informal institutions of social control and organization together," and formal institutions are most effective when closely matched with those institutions "that emanate from cultural norms" (Cornell & Kalt 2000: 453).

*B. Thought Style, Occupational Rituals, and Vulnerability: Policing Is Situationally Embedded*

Drawing on ethnographic research in a large city in the Netherlands, Brown and van Eijk (2021) have situated officer decision-making within wider policy and political discourses that encourage proactive policing and reinforce racial and ethnic profiling, despite mounting criticism of this practice. Similar to analyses of cultural schemata, the authors have examined the role of emotions, combined with more "rational-cognitive" thought styles in policing, to show how vulnerability intertwines with discretionary power in moments of uncertainty. During a stop-and-check, vulnerabilities for frontline police officers can be "informal-interactional" and/or "formal-procedural" in nature. Informal-interactional vulnerabilities refer to interpersonal risks that tend to arise with members of the public in contentious moments. Examples include losing authority, facing heightened aggression, or even violence. Vulnerabilities that are formal-procedural, in contrast, include official accountability frameworks that can initiate disciplinary measures, rendering the officer vulnerable to sanctions or job loss (Brown & van Eijk 2021: 705).

Brown and van Eijk (2021) have found that though emotional “gut feelings” frequently prompt officers to take action, intuition is not recognized as legitimate decision-making logic within the legal system. Police therefore engage in what officers refer to as “plussing,” whereby they “back” their hunches using more “formal-rational reasoning.” Plussing is especially common in response to formal-procedural forms of vulnerability. The four categories of rationalizations during and after a stop have been identified by Brown and van Eijk as: location; appearance (age, behaviour, attire, race/ethnicity, etc.); transportation (bike, scooter, car, walking); and timing (Brown & van Eijk 2021: 701). Rationalized thought styles are then legitimized through organizational rituals that perpetuate the use of such categories and the stereotypes they inevitably reinforce. Rituals include briefing meetings, storytelling among colleagues, training, and courtroom processes of evidence testimony. The following are officer quotes from Brown and van Eijk (2021) that demonstrate (1) the shift from hunch to more reason-oriented justification (i.e., plussing) and (2) organizational rituals that support such plussing.

Well, it’s difficult. You just know when something is not right. Last week, I was working in the middle of the night. I was driving in a neighbourhood, and I see a youngster with a hoody hanging on a porch, my gut feeling is the first to respond. Why would a youngster be hanging on a porch in the middle of the night? But I try to stay objective by plussing. Maybe he is walking his dog? No, he doesn’t have a dog. Maybe his grandma is sick, and he is helping her? No, because there are no seniors living in this neighbourhood. Ok, well, maybe he is lost? No, because when you are lost, you go to a big street instead of hanging on a porch. Ok, well what kind of neighbourhood is this? Oh, there have been a lot of robberies in the last month. Check, check, check. Well, and then I just walk up to him, and I start asking him questions (Officer, “male, white-Dutch, age-30s,” in Brown and van Eijk 2021: 699).

You might want to have a look at our arrest board. In these briefings, we get endless lists of foreign names that our team manager can hardly pronounce... when you continually hear these foreign names from North-African descent, you become used to it, you just start linking that group of people to criminal activity (Woman, “white-Dutch, age-30s,” in Brown and van Eijk 2021: 704).

## Culture in Police Organizations

I always act according to the Road Traffic Act. It just saves me a lot of trouble, so it's just easier. Because when you stop someone without a specific reason, you hear: it's because I'm [Dutch] Moroccan or [Dutch] Turkish or whatever. But when you act according to the Road Traffic Act, you can just say: "No, I'm stopping you because you aren't wearing your seatbelt." It gives you the immediate right to ask for somebody's ID (Male, "white-Dutch, age-30s," in Brown and van Eijk 2021: 702)

The above studies underscore the embeddedness of police culture: how police officers use it is both locally entrenched and situationally rooted. Such findings echo Chan's (1997) earlier research on a failed attempt to bring about reform to the New South Wales Police in the early 1990s. Her work has focused specifically on attempts to change discriminatory police–minority interactions, which, despite sweeping reforms initiated by then Commissioner John Avery, had seemingly no effect. For eight years, reformers strived to cultivate professionalism, redesigned the command structure, revamped recruitment standards, and implemented a community policing model. While the reforms did alter some aspects of organizational routines and police operations, the target problem of racism in policing was largely untouched (Chan 1997). To account for this failure, Chan has described police culture as residing within a “field, that is, the social, economic, legal and political sites in which policing takes place” (1997: 92). She has argued that efforts to modify police social dispositions may influence police performance, but only if the structural condition in which it functions (i.e., the field) has also changed in a way that reinforces new dispositions. In this case, change to the health of police–minority relations in NSW could not be achieved under a government pushing a law-and-order agenda, whereby heavy political interference obscured the responsibilities of leaders, gutted or reversed some measures entirely, and continued to emphasize crime reduction above all. Chan (2007) has argued, “These messages helped frame and define the meaning of reforms; they provided the cues and labels that rank-and-file officers could draw upon for making sense of organizational changes” (334). Police actors are thus at the centre of Chan's model: they are

active interpreters of their world, using their cultural knowledge to navigate their structural condition and to produce and modify their practice.

#### **IV. Organizational Sociology**

There is significant overlap between the work of cultural sociologists and those studying culture through the lens of organizational sociology or organizational behaviour studies. However, distinction can be drawn in order to carry out more bounded analyses of specific organizational forms—associations, universities, corporations, and any other organized body of people with a common purpose. The idea that “culture trumps” in organizations is an old one. Author and management consultant Peter Drucker is famously credited for the phrase “Culture eats strategy for breakfast” (Engel 2018). While there are certainly exceptions to the rule, the key takeaway from such pronouncements is that organizations should never leave culture unattended when making plans. In 2015, the Interim Report of the US President’s Task Force on 21st Century Policing included a similar adage more suitable to a government-based institution: “Organizational culture eats policy for lunch” (President’s Task Force 2015: 10). This section reviews literature that focuses on culture in organizational environments and is particularly relevant for questions about “stasis and change” and thus about organizational reform.

Though organizations experience moments of transition or instability, organizational structures are broadly subject to strong inertial forces (Carrillo & Gromb 2007; Dimaggio & Powell 1983). This means that organizations and their members react slowly to both opportunities and threats in their environments. Furthermore, organizational structures and cultures are reproduced through institutionalization, a process that occurs when social processes, obligations, routines, or structures come to take on a “rule-like” status (Meyer & Rowan 1977; Zucker 1977). Organizational sociologists have uncovered several features of organizational life

that sustain this process, which usually promotes stasis over change. This area of research is vast, but this section reviews a few of the concepts that are closely tied to culture or that have been mobilized to make sense of organizational “culture” (in some cases, police culture specifically). These include institutional logics, institutional myths, and decoupling.

### 1. Institutional Logics

“**Institutional logics**,” first described by Friedland and Alford (1991), are a set of “material practices and symbolic constructions which constitute the organizing principles [of the institution] and which are available to organizations and individuals to elaborate” (248). They are historically patterned, offer generalized rules that dictate appropriate practices in specific circumstances, inform vocabularies, provide meaning to daily activity, and even organize time and space (Thornton et al 2012).

Institutional complexity means that it is not uncommon for a public sector organization (e.g., a university, government, or police service) to “confront incompatible prescriptions from multiple institutional logics” (Greenwood et al 2011: 317). For example, a university may honour discovery, critical thought, autonomy, and learning for learning’s sake, but its management and day-to-day functioning may also be heavily imbued with corporate language about providing quality service and experience to consumers, and it may face rising political pressure to measure outputs and meet performance indicators, to which funding and limited resources are tied. Vaughan’s case study on NASA’s Challenger launch decision is particularly useful for assessing conflicting cultural patterns around “sudden” and critical disruptions, both pre- and post-event—in this case, an avoidable space shuttle explosion that resulted in seven fatalities. Vaughan (2002) has argued that a reliable relationship exists between organizations and the material and cognitive resources in which their component actors engage. At NASA, this

means that engineers and administrators could disregard the many warning signs they encountered because “objection to launch” defied the institutional logic of the organization, which promoted the doctrine of “acceptable risk” and a “culture of productivity” (Vaughan 1996).

Terpstra et al (2019) have similarly argued that conflict between institutional logics plays a significant role in change and continuity within policing. They have used the framework of competing logics to explain the fate of “community policing” in the Netherlands, though the findings resonate too for North American policing, where community policing generally remains a “half-baked” approach to law enforcement in practice (Leighton 1991; Skogan 2004; Wood et al 2004; Zhao et al 2003). Specifically, Terpstra et al (2019) have identified the most prominent aspects of the work of community officers, which includes “knowing, and being known,” cultivating long-term rapport, and building trust. The logic of community policing thus appears fundamentally to collide with the “core business” of law enforcement, namely crime-fighting (Terpstra & Salet 2019). The philosophy of community policing is viewed as having deviated from this focal concern, redirecting officers from “real police work” in favour of a “soft” approach to crime control (Terpstra et al 2019). These findings are reminiscent of the distinction made by Herbert (2001) between “hard chargers” in policing, who prefer “chasing bad guys,” and the demeaned, feminized “station queens,” who do the work of community consultation (see section II.2.E. above). Law enforcement in its “purest” form (i.e. crime-fighting) is more consistent with the militaristic and masculine ethos of traditional police culture values. However, another more recent conflict has emerged, not just among the police but across several public sector institutions: the increasing influence of standardized and quantitative measures and targets. This shift ousts the more communicative aspects of community policing and its emphasis

on more tacit forms of knowledge, which are more difficult to appraise (Terpstra 2008). Such findings parallel the account above regarding the “Blueville Way” and the perceived cultural (mis)match brought forth by efforts to standardize policing initiatives (Campeau 2018).

Competing institutional logics within policing can also be detected since calls to “defund police” have become louder and the push to reform has strengthened. Pressure is mounting for municipal leaders to focus more on community health and wellbeing broadly over crime and law enforcement. This has prompted innovative thinking on the part of some police administrators to incorporate external stakeholders and the solutions they can marshal directly into the fold of their organizations, with the goal of combining skills and resources through a multi-agency approach. For example, Edmonton Police Chief Dale McFee announced the launch of the Community Solutions Accelerator (CSA) in 2020, a community hub that supports projects using data from a variety of sources, not just crime intelligence (Gibson & Pratap 2020). The aim is to develop solutions for several social problems (including addiction, homelessness, and mental health issues), many of which are precursors to crime. Whether the institutional logic of “traditional” law enforcement will undermine those that prevail in institutions of health, education, and social welfare remains to be seen, but this initiative is an example of multiple institutional logics being addressed directly in order to help them coalesce rather than collide. As Scott et al (2000) have argued, institutional logics do not operate in isolation and must be examined in relation to the relevant institutional actors, their relations of power, and the structures of governance around them.

## 2. Institutional Myths

A close cousin of institutional logics is the **institutional myth**. These are widespread understandings of social reality that possess an intrinsic quality of “truth” about them, even if

inaccurate or unfounded; and they are often used to justify ways of doing things, regardless of whether those ways are (objectively) the best or most efficient (Meyer & Rowan 1977).

Researchers have observed how “myths become incarnate” in organizations (Hallet 2010: 52) by examining how they are propelled by individual actors through their social interactions and articulation of interests. Institutional myths operate in both formal and informal senses. Their formal adaptation is the official blueprint of an organization’s explicit mandate, technologies, policies, procedures, as well as its network of offices, departments, and programs. These are highly rationalized, bureaucratic, public, and impersonal; and they provide sources of legitimation. Conversely, informally coordinated commitments are employed “backstage” to manage everyday routines and relationships according to preferred methods. However, a well-known truth about organizations is that formal and informal arrangements are only loosely linked to one another: rules are often violated, decisions and programs go unimplemented, and evaluation systems are compromised (Meyer & Rowan 1977). Given this gap between formal structures and actual workplace behaviours, in practice, organizations often adopt formally institutionalized myths *ceremonially*: they merely “perform” various ritual activities to validate their “social fitness” among external institutional constituents, thereby securing their legitimacy.

In the context of policing, executive leadership and senior administrators actively engage in myth-building in order to demonstrate that they indeed look like and function as a police department (Crank & Langworthy 1992). This myth-building preserves the legitimacy of their organization in the broader community of relevant actors, which, for policing, includes (among others) police associations, oversight bodies, the media, courts, and city councils. Examples of ceremonially adopted myths identified in policing research include the integration of a “community policing” model (Mastrofski & Uchida 1996), recruitment tactics that target

## Culture in Police Organizations

minority groups (e.g., “open houses”), and internal reviews for police conduct (Crank 2003). Myth-building signals their compliance with external expectations, even though studies show these are more accurately described as performed rituals (i.e., ceremony) rather than understood as entrenched, consistent practices in the day-to-day operations of the organization.

Schaap’s (2021) work has revealed that several of the police trust-building strategies implemented across Europe (England and Wales; Denmark; Netherlands) are propelled more by rationalized myths than by policy-driven imperatives based on sound evidentiary support. For example, following sweeping police reform that led to a restructured and amalgamated National Police in the Netherlands in 2013, a key trust-building strategy was the promotion of a “service model” for policing. One way that ministers secured buy-in for this model from regional police practitioners was through a rationalized myth about the nature of trust in the police–public relationship—namely, that public satisfaction is at the root of trust.<sup>8</sup> Where police studies emphasize trust through delivery of outcomes (e.g., reducing crime), or where criminology roots trust in fair police–citizen interactions (i.e., procedural justice; see Tyler 2004), the service model decenters these concerns in favour of a “customer satisfaction” logic (Cordner 2014; Eck & Rosenbaum 1994; Leighton 1991; Reisig & Giacomazzi 1998). The relationship is thereby reframed: citizens who are “satisfied” with police “services” will trust the police. According to Schaap,

Strategies are often characterised by good intentions, but also by wrong assumptions, selective blindness, and communication errors. An observed lack of public trust in the police is only one factor that shapes police trust-building strategies. Improving public trust and legitimacy, then, is not a matter of

---

<sup>8</sup> Schaap (2021) has not specified the precise mechanisms through which this myth was cultivated. However, the author has provided examples of strategies that invoke the satisfaction-is-trust rationale. These include wider use of social media and instant messaging platforms (Twitter, Facebook, WhatsApp, etc.) for crime reporting and first response, as well as a mandatory feedback policy, whereby victims or crime reporters can learn about the status of cases. These strategies assume that members of the public evaluate police service in the same way they would that of any commercial actor.

pushing the “right” buttons on a metaphorical policy dashboard. Trust-building strategies, while goal-oriented, are multi-layered practices that also carry important symbolic implications beyond trust (Schaap 2021: 317).

Again, whether such reforms are de facto trust-generating is unknown, and even disputed. For instance, Terpstra et al (2019) have matched core features of a service model in the Netherlands and Scotland with the birth of an “abstract police”—dis-embedded police organizations that are distant from the community.

Whereas Schaap (2021) has situated strategic use of myths within the context of large-scale restructuring and police reform, I have drawn on research about formal and informal institutional myths in order to account for **cultural inertia** in policing (Campeau 2019). Cultural inertia is a reluctance to adapt to shifting environmental conditions (Carrillo & Gromb 2007). Cultural inertia has remained a feature of policing despite the widespread change that has characterized North American policing over the last three decades (including changing personnel demographics, introduction of accountability mechanisms, and new hiring and promotion policies). In preserving certain institutional myths, highly ranked officers display to outsiders their “social fitness” as members of a progressive police department while simultaneously maintaining the status quo within the organizations (Campeau 2019). For instance, in discussing the demographics of their police service, officers I spoke with clearly articulated defence or criticism of the reigning myths surrounding diversity recruitment. Morally driven ideas about police officers who did not get their jobs “on their own merit” strongly endorse informally institutionalized myths about “the team” as paramount, thereby justifying practices that continue to favour white male officers:

Fortunately, I’m from the old school, where you have the best for the job. Purple, green, female, male—whatever. Over time we’ve seen that it’s backfired on them because they haven’t hired the best person for the job. They hired based on race. “Okay, we need an Indian officer, a Chinese officer,” whatever, and they aren’t the best officer on the job, and that gets exposed when they

## Culture in Police Organizations

come here because your true colours come out... Either you're meant to do this job or not... I think years ago they hired more based on: you play team sports and you get it. That always really transferred well into the police service. Now they're hiring people for the wrong reasons, and it doesn't transfer well over here... and that kind of hurts everybody. It puts my life in danger, other people's lives in danger, and it causes low morale (Constable Aiden, in Campeau 2019: 75–76).

But other officers in my study were more critical, arguing that the service is not only failing in hiring minorities but is blatantly uninterested in doing so:

Our senior guys [are] huge white men over 5'10", so when they look around the table they see their like image, orientation and history. When they go out to recruit, that tall white male is not representative of the person you're talking to in the audience. The person in the audience, if they're a visible minority or a woman, looks up and goes, "I'm not 5'10". I'm not a white male. This guy tells me he wants me. Who is around here that looks like me that's in any position at all? None. Well, I guess it's pretty clear that they don't want me, and it's window dressing," right? So that's what this place's problem is. They are not trying hard enough, and that's the bottom line. If they wanted them, they'd get them (Constable Mark, in Campeau 2019: 76).

Mark's comments highlight the ceremonial quality of formally institutionalized myths, whereby a modern police organization is expected to engage in operational strategies such as "open houses" to recruit diverse applicants (see also Cashmore 2002). However, exclusionary practices that lead to an entirely white male administration act not only as impediments to even genuine efforts to diversify but also as the impetus for old-school ideas to continue thriving.

### 3. Decoupling and Loose Coupling

What logics and myths have in common is what plagues efforts to bring about change to their dominance. Research that underscores inertial forces in organizations shows that once routines become institutionalized, arrangements come to be defended along moral and political lines rather than technical ones (Hannan & Freeman 1984). For this reason, "because we've always done it this way" can be enough justification to continue a practice, regardless of whether it complies with standard operating procedures or formal rules, and even if it is objectively inferior

to alternative approaches. This is what has come to be known as “**decoupling**”—a key term in organizational sociology. Decoupling, which is invoked by social scientists to characterize situations in which formal policies or structures are disconnected from substantive practices (Bromley & Powell 2012), is often the root cause of failure when organizations initiate sweeping change through top-down policy reform alone. For example, decoupling appears prominently in the literature on international human rights. It has become nearly impossible for countries to ignore human rights norms because they have become so highly legitimated on the global stage (Hafner-Burton et al 2008). However, what we see is that “repressive countries routinely join, but rarely implement, human rights treaties” (Cole & Ramirez 2013: 702).

Johnson and Vaughn (2016) have drawn on the concept of decoupling to understand organizational failures in policing. “Decoupling can be initiated by street-level officers ... and practical organizational members as an attempt to maintain autonomy and a differing culture. Conversely, decoupling can be initiated by the administration in an attempt at self-preservation” (Johnson & Vaughn 2016: 162) to insulate themselves from rogue sub-units or deviant members.<sup>9</sup> They suggest therefore that “police organizations function optimally in a *loosely coupled* state” (158, emphasis added), and it is when police departments slip into decoupled states that organizational crisis is most likely. “Loose coupling” is when sub-units in organizations, such as patrol in law enforcement, share similar ambitions to the parent organization (i.e., the police service) and maintain a degree of responsiveness but also retain a level of autonomy and distinctiveness to remain semi-independent to the organization at large (Orton & Weick 1990). Johnson and Vaughn (2016) have argued that this model is healthy and

---

<sup>9</sup> Punch & Gilmour (2010) have described such attempts at self-preservation through the defensive metaphor of “bad apples” in police organizations, which “conveys an image of a few reprehensible individuals who, if removed, will no longer contaminate the otherwise healthy apples” (11).

## Culture in Police Organizations

functional in criminal justice institutions because a certain amount of discretion must be delegated to line staff, and in the case of policing, there is substantial devolution of authority granted to frontline officers. Given the significant powers handed down the hierarchy to patrol divisions, including the exclusive right to apply non-negotiable coercive force and to detain individuals, a certain amount of oversight by the administration is critical. Proper oversight and a degree of responsiveness between police leaders and sub-units secures a connection to “the values of the parent organization with respect to policy, procedure and identity” (Johnson & Vaughn 2016: 164).

However, what we often see in empirical examinations of policing, like those discussed above on institutional logics and myths, is that even loose coupling leads to reform failure in policing. Others have studied this phenomenon through the case of community policing. For example, Zhao et al (2003) have documented a clear disconnect between the ideal implementation of community policing and its practical application (see also Burruss & Giblin 2014; Maguire & Katz 2002). Even when community policing became a broadly diffused innovation across North America and even though police leaders advertised their mission through the language of community policing’s principles, functional priorities and outputs remained largely unchanged in their focus on crime-fighting (Zhao et al 2003).

DeValve (2020) has also applied the concept of decoupling to the institution of policing to describe the scant reforms to come out of the “defund police” movement, despite the movement’s global reach. He has argued that police administrators prize legitimacy over authentic trust. This results in deep decoupling, as street-level officers operate counter to the interests of the communities they serve (e.g., with violence, racial and ethnic profiling), despite stated organizational goals of community service and protection:

[T]he cleaved and cratered topography of the policing environment, marked by deep decoupling in justice practice generally, the charged field of multivalent demands on police, and the enhancement of extant myths related to the purpose of police and the nature of justice have all resulted in the enemization of citizens and the fortification of organizational boundaries that have in turn resulted in violent conflicts wholly inconsistent with the continuation of the American police institution as such (DeValve 2020: 139).

#### 4. Exceptions to the Rule?

Despite strong pulls towards preserving the status quo, organizations of all kinds do experience change, particularly in response to new pressures. The extent to which the following examples relate specifically to *culture* varies, but they are useful case studies for theorizing about organizational culture reform in the field of policing.<sup>10</sup>

One way change occurs is through newcomers. Dezalay (1990) has studied legal fields and the deregulation of capital markets, concluding that the arrival of new financially savvy players can accelerate the breakdown of the “old legal order,” making both “possible and urgent the construction of new norms” (283). Espeland (1998) has also highlighted the impact of newcomers, explaining how “new guard” bureaucrats used science and environmental impact projects to decenter the “old guard” engineering ethos, ultimately resulting in the halt of construction plans for the Orme Dam in the American Southwest. Espeland’s book *The Struggle for Water* thus documents a case of *recoupling* (see also Hallet 2010), whereby once decoupled decision-making processes become recoupled as part of technical, instrumental, and rational frameworks.

In my own findings relating to newcomers, I have noted cultural inertia in organizations (Campeau 2019), though this is not the same thing as absolute stasis. Use of the term “inertia” is

---

<sup>10</sup> My attempts to uncover documented examples of police organizations that deliberately pursued reform to their “culture” in order to better align with their organizational strategy proved unsuccessful. Such cases tend to be discovered through anecdotal evidence rather than empirical investigation. One hopeful exception is a doctoral dissertation project that is currently underway at the University of Alberta.

## Culture in Police Organizations

deliberate. In physics, an object in motion will continue to move in its current direction and velocity until some force interrupts this momentum. Narratives of frustration in policing reform can mask the slow but real changes brought about by demographic shifts in police personnel (Campeau 2019). For instance, one of the most powerfully incarnate myths among officers wielding old-school cultural scripts is that solidarity (“team,” “family,” “cohesiveness”) is paramount. However, old-school officers now address this subject in a clearly defensive manner: diversity recruitment leads to “unreliable” officers, and higher education leads to entitlement and the questioning authority (Campeau 2019). In other words, their concerns showcase the myth’s vulnerability, not its durability. In an era of that demands diverse, more educated officers and a police occupation marked by increasing professionalism and accountability, the deployment of such myths can be read as a sign of cultural change (Campeau 2019). Natural generational turnover can influence such change. Establishing an organizational hierarchy structure that disrupts the distribution of power and the paramilitary lock-step path upward in police departments can also be a means for change, so that newcomers are not systematically relegated to the bottom. One possibility is to emphasize and reward expertise over pure seniority.

Another factor that can ignite organizational change is an external prompt from a governance structure. In the hospital sector, Kellogg (2009) has studied new work schedule regulations in US teaching hospitals. Though pressure to change was externally rooted in new directives for medical professionals (and thus susceptible to loose coupling), it was a strategic reallocation of human resources that secured the desired shift. Kellogg has found that a “cross-position collective” between middle managers and subordinate employees can challenge status quo defenders. When interns were paired with reform-minded chiefs and residents, views

associated with the decision to sign out shifted from “I must be the first here and last to leave” to “the rules require me to leave the hospital” (Kellogg 2009).

In the education sector, Sauder and Espeland (2009) have shown how the introduction and subsequent growth in popularity of school-ranking systems have influenced how administrators in law schools think about their institution and make decisions. They argue that rankings, as commensurate, relative, and broadly circulating measures, are more difficult to resist than are other types of external pressures, and they have thus been particularly generative in the world of education. Like in Kellogg’s (2009) study, the impetus for change stemmed from outside the institution itself but acts upon individual members’ sensemaking. Sauder and Espeland (2009) have marshalled Foucault’s insights about surveillance and the “disciplinary power” of the internalized gaze to capture the affective process that mediates how school administrators—many of whom are also educators—respond to environmental pressures. There are cognitive and normative implications with widely disseminated rankings in a competitive field: rankings produce anxiety and evoke a desire to better one’s position. Put simply, they argue that “law schools’ reactions to rankings are best understood as the evolving responses of an assortment of actors who struggle to reconcile their sense of themselves as professional educators with an imposed market-based logic of accountability” (Sauder & Espeland 2009: 66). Concerned that other schools are exercising the evaluative model to rank highly and to boost the reputation of the institution and its professional members, administrators act accordingly. The result, in this case, is that practices have been tightly coupled with formal organizational structures.

## V. Final Remarks

A review of literature in the disciplines of criminology and police studies, sociology of culture, and organizational sociology yields one clear conclusion about “police culture”: *inaugurating cultural change that sticks means focusing on people*. No matter the catalyst for change—new legislation or policy, transfer of leadership, social movements, crisis—people matter most. Ultimately, how people make sense of things, be it their work, their position relative to others, what is rewarded, what is devalued, etc., will impact how efforts toward change are absorbed, buffered, or refracted entirely.

Importantly, how people draw meaning is always anchored within particular institutional constraints, and this report conceives of culture as a “resource” that serves as the interpretive link between external social structures and subjective experiences. This approach is useful for studying policing specifically but also public-oriented institutions in general, which are particularly subject to social, political, and economic shifts. In other words, aligning the concept of police culture with the theoretical framework of culture allows researchers to embed policing socially and historically, thereby carving a space to account for a changing environment wherever such change may be impactful on institutional life. For example, Canadian police departments are adapting to calls for greater diversity in recruitment to reflect increasingly multiethnic city demographics, pursuing more community-based initiatives (Leighton 1991), adhering to more stringent training and evidentiary standards (Council of Canadian Academies 2014), and experiencing unprecedented levels of public oversight and mediatization (Campeau 2015; Goldsmith 2010; Pagliaro 2013). Some change is slow, such as the integration of women into police ranks, while some change occurs quickly or abruptly, like when legal decisions alter police procedure or when an organizational “crisis” occurs (e.g., officer death, scandal, etc.). But

no matter the pace of change, we can adopt conceptual tools like those described throughout this report to decipher how meaning is produced by police officers to make sense of occupational life. “The act of ‘making sense’ creates (‘enacts’) the environment people face” (Chan 2007: 326).

Organizations that do risky or contentious work are constantly implementing policy and taking action under conditions of uncertainty or turmoil, and the work of the Mass Casualty Commission as it relates to policing and reform sheds rigorous light on this very fact. Increased visibility and stringent mechanisms of oversight for law enforcement mean that police officer decisions—not just corruption, misconduct, and mistakes—are scrutinized more than ever. And when police do wrong, “police culture” is quickly denounced. However, a clear paradox arises when one considers the usual response to such criticism—namely reforms that focus on misconduct or error-reducing measures for individual officers and specific decision-making situations. Examples include advanced incident response training, better de-escalation techniques, less lethal weaponry, or body cameras. However, research that focuses on culture specifically suggests that if cultural change is the objective, greater concentration must be placed upon organizational systems, internal relations, and the local settings in which members do their work, because these serve as institutional constraints under which meaning is negotiated and culture is wielded by members.

With this in mind, we can recalibrate our thinking about “police culture” and ask ourselves not whether police culture is “good” or “bad” but rather “which cultural resources are wielded *most* by members *and why*?” We ought to contemplate not the “resistance” of police culture acting as a *block* to transformative change but rather its “inertial forces” that are either

suitable to (and can therefore be seized) or incompatible with proposed strategies and objectives for innovative reform.

## EXECUTIVE SUMMARY

This report first briefly describes the terrorist attack that targeted politically active youth on Utøya Island, Norway, on 22 July 2011. It then describes the national outreach program that was implemented in response to the attack to meet the health care needs of affected citizens. We also explain the methodology of the comprehensive longitudinal interview study designed by the Norwegian Centre of Violence and Traumatic Stress Studies (NKVTS) to explore the impact of this attack on survivors. Subsequently, we outline some potential consequences of being directly exposed to a terrorist attack and sum up our main findings on the impact of the Utøya Island attack on the health and functioning of the young survivors. We will also describe existing knowledge on the support needed by survivors and families of victims of mass casualty events. Finally, we share how the knowledge from this study can inform decision-makers providing health care services and follow-up in the aftermath of a mass casualty.

## RÉSUMÉ GÉNÉRAL

Ce rapport commence par décrire brièvement l'attaque terroriste qui a visé des jeunes politiquement actifs sur l'île d'Utøya, en Norvège, le 22 juillet 2011. Il décrit ensuite le programme national de sensibilisation qui a été mis en œuvre à la suite de cette attaque, afin de répondre aux besoins en soins de santé des citoyens touchés. Nous expliquons également la méthodologie utilisée pour l'étude longitudinale complète des survivants réalisée via des entretiens et conçue par le Norwegian Centre of Violence and Traumatic Stress Studies (NKVTS) en vue d'explorer les répercussions de cette attaque. Nous présentons ensuite certaines conséquences potentielles d'une exposition directe à une attaque terroriste et résumons nos principales conclusions sur les conséquences de l'attaque de l'île d'Utøya sur la santé et le fonctionnement des jeunes survivants. Nous verrons également les connaissances existantes en matière de soutien à apporter aux survivants et aux familles des victimes d'un accident de masse. Enfin, nous étudierons la manière dont les connaissances issues de cette étude peuvent informer les décideurs chargés de fournir les services de soins de santé et le suivi nécessaires après la survenue d'un accident de masse.

## I. THE TERRORIST ATTACK ON UTØYA ISLAND

On the 22nd of July 2011, a right-wing extremist conducted two consecutive terrorist attacks targeting the Labor Party in Norway. After having detonated a car bomb outside the government quarter in Oslo, killing nine people, injuring many, and causing immense material damage, the perpetrator moved to Utøya Island, 30 kilometers north of Oslo, where the Norwegian Labor Party was holding their annual youth summer camp. In total, 564 people were gathered on the island, mostly youths and young adults. For about one hour and twenty minutes, the perpetrator shot, killed, and wounded those he came across. 68 people were killed on Utøya Island, and 34 were hospitalized with extremely severe or life-threatening physical injuries from gunshots, of whom one died after admission to hospital (Bugge, Dyb, et al., 2017; Gaarder, Jorgensen, et al., 2012; Jorgensen, Naess, & Gaarder, 2016). Many more sustained injuries that did not require hospitalization (Bugge, Dyb, et al., 2015).

Numerous factors amplified the brutality of this attack. First, the youths were isolated on a small island of only 26 acres as the perpetrator hunted down and shot them. They all heard gunshots, and most hid or ran from the terrorist as they realized their lives were in danger. Their only chance to escape was to swim to the mainland across the cold fjord, with the risk of drowning. Second, the survivors saw dead bodies and witnessed others being injured or killed. Third, the perpetrator was extremely brutal. He often shot the victims several times, and the mortality rate was high. Since the participants of the summer camp had many friends and acquaintances on the island, most survivors lost friends and/or family members in the attack. Finally, the perpetrator was disguised as a police officer and claimed that he was sent to the island to secure the summer camp after the bombing of the Governmental quarter in Oslo. Due to the disguise, he was given permission to access the summer camp and successfully lured some victims from their hiding places. The disguise also confused victims, as not only the perpetrator but also rescuers were subsequently perceived as threatening (Filukova, Hafstad, & Jensen, 2016). For example, 28.7% of survivors developed a fear of boats as a result of thinking that the terrorist was using a boat to shoot swimmers, or that a new group of terrorists was approaching on boats. When they saw volunteers using binoculars to spot survivors or locate the terrorist, they thought they were seeing a gun. When police finally arrived at the island after 1.5 hours, not everyone looked at the officers with relief. Rather, 24.7% of the victims feared the police and/or thought they were seeing a new group of terrorists disguised as police officers. Due to the nature

of the chaotic and unresolved situation, the police approached them with weapons ready, which further escalated fear of police among the camp participants. This left many with extended fear, as they did not know whom to trust when rescuers came to their aid (Filukova, Hafstad, & Jensen, 2016).

## II. SUPPORT OFFERED AFTER THE 22ND OF JULY ATTACK

The following section briefly describes the health care system in Norway and the immediate, medium-term, and long-term support offered to survivors of the 22nd of July terrorist attack and to their families.

### 1. The Health Care System in Norway

The public health care system in Norway is organized at two administrative levels. The municipalities are responsible for primary health care, including primary somatic and psychological health care, emergency and crisis care, community-based institutional care, and community public health measures. The state is responsible for specialized health services provided by hospitals and outpatient clinics. Everyone living in Norway has the right to necessary, need-based health and social services. This right to receive adequate help also applies to refugees and other immigrants with legal residence in the country (Helsenorge, 2019). Health care is ensured through the National Insurance Scheme (*Folketrygden*), financed through an annual citizen fee (*Trygdeavgift*). As a result, necessary, hospital-based treatments for severe somatic or mental injury or illness is free for everyone, whilst primary health care is free for children up to 18 years of age and low-cost for everyone else. Preventive and health-promoting services are provided at the lowest effective care level (Lavest Effektive Omsorgsnivå, LEON) (Norwegian Psychological Association, 2008). The LEON principle is enshrined as a municipal and county municipal obligation through current legislation and in a number of public plans.

### 2. Acute Support Provided for Survivors and Their Families

Immediately after the terrorist attack on the 22nd of July, severely injured survivors and those who were hypothermic from swimming in the fjord in order to escape the perpetrator were transported to hospitals for treatment. In addition, municipal health authorities established a

## Survivors and the Aftermath of the Attack on Utøya Island

temporary emergency center at a hotel (Sundvolden) close to Utøya Island. Here, first responders, medical and psychosocial personnel, and volunteers from the community provided care and support for the more than four hundred survivors who had been evacuated from the island but did not require urgent, advanced medical treatment. First responders (health care personnel and police) and the crisis teams from the municipality provided psychosocial support according to well-known principles and standards (Bisson, Tavakoly, et al., 2010). The “five essential elements” of psychological first aid: safety, calming, self and community efficacy, connectedness, and hope (see Hobfoll, Watson, et al., 2007) were attended to.

In Norway, psychosocial crisis teams have been trained in Psychological First Aid following these principles (Brymer, Jacobs, et al., 2006). We do not know to what extent this protocol was systematically applied at the emergency center, but survivors and parents have reported that first responders and psychosocial teams made efforts to enhance the sense of safety, gave information, and helped to contact family members and friends. Meanwhile, the sense of security was challenged by rumors of multiple perpetrators or attacks that reached them from talking to peers or from postings on social media platforms. Also, bad news of casualties kept coming in. Efforts from responders and family members at the emergency center to enhance the feelings of safety, calming emotional reactions and getting accurate and updated information from reliable sources, may have helped survivors coping with acute stress reactions.

Survivors from Utøya were residents from 120 different municipalities across all nineteen counties in Norway (Kärki, 2015). They were transported back to their homes within the first days after evacuation from the island. One of the first messages from the national health authority, issued through the nineteen county governors of the municipalities, was that each municipality was expected to have a well-functioning psychosocial team to meet and accommodate the immediate needs of the returning survivors and the bereaved (Kärki, 2015).

### **3. Intermediate and Long-term Support: The National Outreach Program**

Under-treatment and high levels of unmet needs among survivors have been documented years after terror attacks (Brewin, Fuchkan, et al., 2010). Within days after the terrorist attack in Norway, county governors received feedback suggesting that survivors’ needs were not being met in the health care system. Norwegian health authorities therefore decided to develop a national plan for comprehensive psychosocial responses to advise affected municipalities on how

to organize health services and support for the directly affected families. The Norwegian Directorate of Health called upon trauma experts from the Norwegian Center for Violence and Traumatic Stress Studies (NKVTS) and the Center for crisis psychology in Norway to design the plan. Internationally, consensus documents have been developed to provide evidence-informed principles and recommendations for planning and providing outreach post-disaster (Bisson, Tavokoly, et al., 2010; Hobfoll, Watson, et al., 2007; National Commission on Children and Disasters, 2010). These documents, general trauma knowledge, and experiences in Norway with an outreach program for families directly affected by the tsunami in Southeast Asia in 2004 (Dyb, Jensen, & Nygaard, 2011) guided the planning. In particular, we based our recommended plan on the principles of early and proactive outreach to all survivors of mass trauma (American Psychiatric Association, 2006); contact with affected families over time; and provision of more targeted responses for individuals in need of more extensive help (O'Donnell, Lau, et al., 2012; Zatzick, Roy-Byrne, et al., 2004)

The suggested outreach plan was reviewed by other health professionals and researchers and was approved as the Governmental strategy on 28 July 2011 and implemented in the 120 affected municipalities (Kärki, 2015). The nineteen County Governors were responsible for the implementation process, as they are the state's representative in local counties and are responsible for monitoring the decisions, objectives, and guidelines set out by the government,<sup>1</sup> providing an important link between municipalities and central government authorities. The Norwegian Directorate of Health also established a cooperation body that included County Governors,<sup>2</sup> the Norwegian Association of Local and Regional Authorities, and other stakeholders to ensure a smooth implementation of the strategy.

In accordance with the LEON principle, and since survivors and their families lived in municipalities across the entire country, the outreach plan was anchored in the existing health services in the municipalities across the nineteen counties (Jensen, Stene, et al., 2019). The outreach program was based on three main principles:

### **1. Proactive, early outreach:**

<sup>1</sup> See the website of the County Governors - Statsforvalteren.no., <https://www.statsforvalteren.no/en/> (accessed 25 March 2022).

<sup>2</sup> See the website of the Kommunenes Sentralforbund, <https://www.ks.no/om-ks/ks-in-english/> (accessed 25 March 2022).

## Survivors and the Aftermath of the Attack on Utøya Island

The crisis teams in the municipalities were required to establish early contact with the survivors and their families, provide acute crisis interventions, and give information about the outreach program within days after the attack.

**2. Continuity:**

The municipalities each appointed a designated professional as the “contact person” for survivors and their families for at least the first year. The contact person was most often a medical professional (i.e., general practitioner, psychologist, nurse), or a social worker. The contact person was to make direct contact with the affected families, offer a personal meeting, and provide information about available help measures in the municipality and in the specialist health care services. The role of the contact person was to ensure a good and regular assessment of the victims’ function levels, their access to social support, and any need for help. The contact person was also responsible for communicating with relevant primary care and mental health services if needed. To aid the contact person in identifying individuals with clinical needs, a simple screening instrument was developed (Norwegian Directorate of Health, 2011). It was recommended that basic screening was to be performed at 5–6 weeks, 3 months, and 6 months after the attack.

**3. Targeted interventions for individuals in need:**

A referral to specialists was recommended if a survivor or their family expressed a need for treatment, if the clinical evaluations indicated such a need, or if the survivor scored above the clinical cut-off on a screening instrument mapping posttraumatic stress reactions, depression, sleep problems, social support, social isolation, level of functioning, difficulty coping with important transitions (e.g., returning to school or work after summer vacation) excessive use of alcohol or drugs, and reluctance to engage in daily activities. The screening instrument (in Norwegian) was developed by NKVTS and reviewed by other researchers and professionals before being provided to all affected municipalities.

The aim of the national outreach program was to ensure that the needs for services of all the directly affected survivors and close family members were identified and met (Dyb, Jensen, Glad, et al., 2014; Norwegian Directorate of Health, 2012). No specific recommendations were provided for specialized mental health services, as it was expected that psychiatrists and psychologists were sufficiently trained to provide customized treatments.

### III. THE UTØYA AFTERMATH STUDY

#### 1. Formation and Design of the Study

The Utøya Study at the Norwegian Center for Violence and Traumatic Stress Studies (NKVTS) in Oslo, Norway is a comprehensive longitudinal study of the impact of the 2011 Norway terrorist attack. NKVTS is funded by the Norwegian state through the Ministry of Health and Care Services, the Ministry of Justice and Public Security, and the Ministry of Children and

## Survivors and the Aftermath of the Attack on Utøya Island

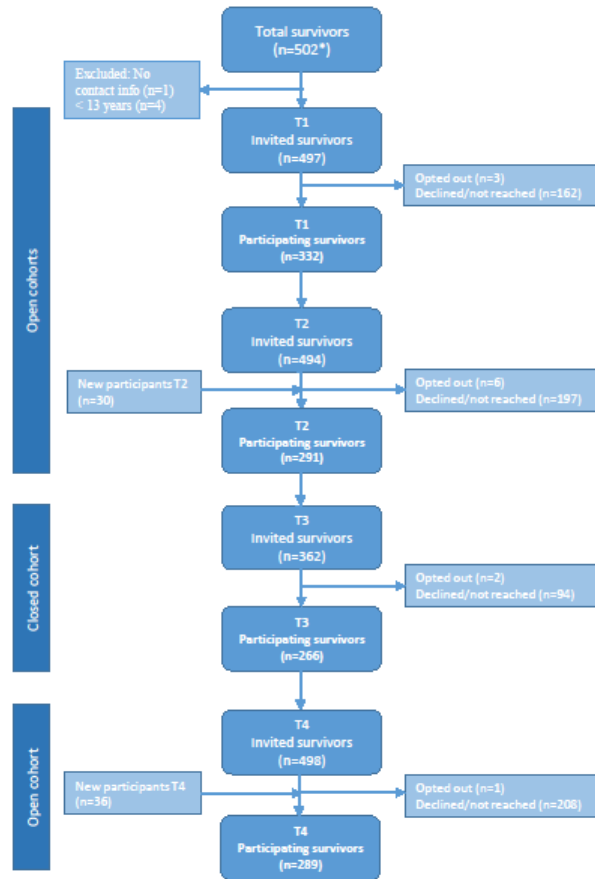

Families. The Utøya project was established in August 2011 with Professor Grete Dyb, MD, PhD, as the Principal Investigator, and it is currently comprised of an additional ten members, including the authors of this Report. The study is funded by the Norwegian Directorate of Health and has consisted of four data collection waves, conducted at 4–5 months (T1), 14–15 months (T2), 30–32 months (T3), and 8 years (T4) post-terror. The data and findings have led to approximately 60 peer-reviewed research papers in national and international journals, which seek to disseminate new knowledge on the impact of terrorist attacks to the public and to decision-makers.

## 2. Study Participants

According to police records, 495 persons survived the massacre on Utøya Island. Five survivors were not invited to the study at T1 due to age (<13 years) or lack of contact information. Additionally, seven members of the Utøya Island summer camp who were absent on the day of the attack self-recruited to the study. See flow chart in **Figure 1** for details.

Survivors and the Aftermath of the Attack on Utøya Island

Figure 1: Breakdown of the Survivors (n = 398) who Participated in the Utøya Study

\* 495 were on the island during the attack; 7 were on the mainland

In total, 398 (79%) of the survivors participated in one or more of the four data collections in the study. Their mean age at the time of the terrorist attack was 19.2 years (SD=4.3, range 13.1–56.7, 94.0% < 26 years of age), and 49.0% were female. The vast majority (88.9%) were of Norwegian origin. One in five (22.2%) reported that they perceived themselves as financially disadvantaged (i.e., much or somewhat poorer than others). There were no significant differences between participants and nonparticipants with respect to age or sex (Stene & Dyb, 2016).

The survivors' caregivers were invited to participate at all four data collections. Caregivers of survivors who were nineteen years or younger were interviewed, whereas caregivers of older survivors (and those who were not available for an interview) participated through postal questionnaires. In total, 541 caregivers participated in the study at one or more point(s) (T1=453, T2 = 426, T3=367, T4 = 302). They were largely of Norwegian origin (92%) and typically reported an average or above average economic status (80.9%) (Haga, Thoresen, et al., 2017).

### 3. Study Procedures

We decided to interview the directly affected in person. Our participants were heavily exposed to the attack, and we expected that many were traumatized. We therefore needed to recruit and train health professionals to do the research interviews and to assess and identify participants who were struggling with unmet needs related to their experience in order to restore contact with GP for transferral to appropriate public health services.

Participants were interviewed face to face at 4–5 months (T1), 14–15 months (T2), 30–32 months (T3), and 8 years (T4) post-terror. At T4, we also included the youngest survivors, who were younger than thirteen years of age at the time of the attack. In each data wave, postal invitations informing about the study were sent to potential participants. Interviews were performed in the participants' homes by health care personnel (mostly psychologists, medical doctors, and nurses), specially trained for the task. The interviews were audiotaped and lasted approximately an hour and a half, with topics ranging from mental and physical health pre- and post-trauma, to personal experiences with the media, the judicial proceedings, and post-trauma school performance.

To measure the participants' reactions to the attack, we used several validated measures. For example, to assess their level of PTSD symptoms, we used the 20-item UCLA PTSD Reaction Index (PTSD-RI) (Pynoos, Rodriguez, et al., 1998; Steinberg, Brymer, et al., 2004). Following the PTSD-RI, responses to interview questions were recorded on a 5-point Likert-scale, ranging from 0 ("never") to 4 ("most of the time"), and possible total scores ranged from 0–68. A threshold score of 38 is used to determine likelihood of meeting the criteria for a PTSD diagnosis (Steinberg, Brymer, et al., 2004). All measures used in the study have been thoroughly described in the relevant publications (see References list). Because the fourth data collection

## Survivors and the Aftermath of the Attack on Utøya Island

was just recently completed, most of the results presented here are based on data from and publications regarding the first three interview waves; however, some preliminary descriptive results from the fourth wave (which have been summarized in a report sent to the study participants) are also included in the present report.

#### 4. Study Objectives

The main aim of the Utøya Study is to provide increased knowledge about how people exposed to terrorism react in the immediate aftermath and to identify important predictors for their short- and long-term needs. This is imperative for preparedness planning and for the development and provision of efficient, evidence-based services after a mass casualty.

#### 5. Research Ethics, Data Protection, and Privacy

The study was approved by the Regional Committee for Medical and Health Research Ethics in Norway (REK 2011/1625 and REK 2014/246). Data collected in the Utøya Study is stored with the Services for Sensitive Data (Tjenester for sensitive data, TSD), an access-limited data repository for collecting, storing, and analyzing sensitive data at the University of Oslo. To protect the privacy and confidentiality of our participants, identification of individual participants is not possible in any published work from the study.

### IV. FINDINGS ABOUT THE IMPACTS ON SURVIVORS AND THEIR CAREGIVERS

The Utøya Island study has provided new knowledge on survivors' and caregivers' mental and somatic health outcomes (including posttraumatic stress reactions, complicated grief, migraines, other headache, pain, and somatic symptomatology), school functioning, experiences with the media, and experiences with the national outreach model (see NKVTS, n.d.). In the following, we first summarize the existing literature on some of the potential consequences of a terrorist attack on survivors and then describe the main findings from the Utøya Study, with a focus on the most relevant health measures in the trauma field.

### **1. Impact on Survivors' and their Caregivers' Mental Health**

The most studied mental disorder that can develop after exposure to a traumatic event such as a terrorist attack is posttraumatic stress disorder (PTSD). Characteristic symptoms of PTSD include: (1) re-experiencing the traumatic event as if it is happening again, including intrusive thoughts and images of the traumatic event, nightmares, and flashbacks; (2) avoiding stimuli associated with the trauma, including places or thoughts reminding of the traumatic event; (3) increased arousal or reactivity, which often results in sleep disturbances, poor concentration, an exaggerated startle response, and irritability; and (4) negative changes in thoughts and feelings, including thoughts about the self (e.g., “I’m weak”) or the world (e.g., “Nowhere is safe”) (American Psychiatric Association, 2013). In a recent systematic review of the literature on PTSD among terrorist attack survivors, García-Vera, Sanz, & Gutiérrez (2016) have found that as many as 33–39% of those directly exposed to threat-to-life during a terrorist attack develop PTSD within the first year. Furthermore, they found that 6–7 years after an attack, 15–26% still have PTSD. These findings demonstrate that many people are at risk of experiencing severe psychological reactions in the aftermath of a terrorist attack and that, for a substantial proportion, these reactions last for many years post-trauma. However, the large individual variation in post-trauma reactions raises important and difficult questions, including “Why do we respond so differently to trauma?” and “What are the main factors that determine how we respond?” (Glad, Stensland, & Dyb, 2021).

Extensive research on potential predictors for PTSD during the last 30 years has led to marked advances in our understanding of factors associated with elevated risk of this disorder. Such factors include personal characteristics (e.g., female sex, ethnic minority status, low socioeconomic status, and history of psychiatric illness), particularities of exposure to the traumatic event (e.g., exposure intensity, bereavement, injury, perceived life threat), and post-trauma factors (e.g., level of social support) (for a review, see Tortella-Feliu, Fullana, et al., 2019). It has also been suggested that exposure to trauma reminders (i.e., cues that resemble the traumatic event and elicit distressing reactions) may play a superordinate role in PTSD because it can trigger symptoms in all the PTSD symptom categories (Pynoos, Steinberg, et al., 2009). Furthermore, highly public disasters such as terrorist attacks can lead to considerable media attention directed towards the survivors, which can be experienced as an extra strain (see Doohan & Saveman, 2013).

## Survivors and the Aftermath of the Attack on Utøya Island

Other well-known forms of psychopathology that terrorist attack survivors may experience are anxiety and depression (Thabet, Thabet, & Vostains, 2016). For example, in a systematic review of the literature on major depressive disorder after terrorist attacks, Salguero, Fernández-Berrocal, et al. (2011) have found that the risk of developing this disorder in the first few months post-attack ranges between 20% and 30% among those directly exposed.

In the Utøya Study, we found that 47% of the survivors reported clinical levels of PTSD in the first wave (4–5 months post-terror): 11% fulfilled the diagnostic criteria for PTSD and 36% for partial PTSD (i.e., meeting criteria for only two out of three PTSD symptom subcategories) (Dyb, Jensen, Nygaard, et al., 2014). Survivors' PTSD levels were more than six times higher when compared to youth in the general population (Dyb, Jensen, Nygaard, et al., 2014). Furthermore, the number of Utøya survivors with clinical levels of anxiety and depression was roughly 45% in the first wave and about 30% and 25% in the second and third waves respectively (14–15 months and 30–32 months post-terror) (Stene, Wentzel-Larsen, & Dyb, 2016). In the fourth wave (8 years post-terror), more than one third of the survivors met/partly met the symptom criteria for PTSD, and almost half (45%) reported that they were struggling with high levels of anxiety and depression symptoms (Dyb, et al., forthcoming).

In line with previous studies in the field, we found that significant predictors for the survivors' level of PTSD were female sex, minority ethnic status, a high level of trauma exposure, current physical pain, the loss of someone close, and low levels of social support (Dyb, Jensen, Nygaard, et al., 2014). Girls and women were more likely to suffer from severe PTSD, as were those of immigrant background. Survivors who had high levels of exposure to the traumatic event, who experienced the loss of someone close, or who had low levels of social support were also more likely to exhibit severe PTSD. Furthermore, physically injured survivors had increased risk for later PTSD symptoms compared to non-injured peers (Bugge, Dyb, et al., 2017). The observed levels of PTSD were higher both among severely injured and among those with less severe injuries, such as fractures, sprains, abrasions or bruises, as opposed to their non-injured peers. Also, feelings of shame and guilt among the survivors were positively associated with PTSD symptom levels (Aakvaag, Thoresen, et al., 2014).

In the second and third interview waves, we asked how often the survivors had experienced various trauma reminders (sounds, visual experiences, emotions, bodily reactions, touch, smells, and situational reminders) during the last month, and which one they perceived to

be the worst (Glad, Jensen, et al., 2016; Glad, Hafstad, et al., 2017). At both sets of interviews, auditory reminders, especially loud and sudden noises, were the type of trauma reminder that the survivors reported experiencing most often, as well as the one they found to be the most distressing. One survivor described it like this:

Sounds and bangs are uncomfortable, for example if I'm sitting in the library and I hear a bang in the cafeteria, I become very alert. That's something that I really cannot control. Then the whole day... then I'm down the rest of the day, it affects my schoolwork and stuff like that (Glad, Jensen, et al., 2016: 148).

Of the 261 survivors who participated in the third interview wave (approximately 2.5 years post-attack), we found that almost 90% had experienced one or more reminder(s) during the past month, and about 20% said that they had experienced strong emotional reactions when they experienced their worst reminder (Glad, Hafstad, et al., 2017). Survivors who met the diagnostic criteria for PTSD reported significantly higher frequency of exposure to trauma reminders compared to survivors who did not meet the criteria for this disorder. These findings suggest that many survivors struggled with mental health reactions for a long time post-attack, that trauma reminders were common for years post-attack, and that PTSD is strongly related to frequency of exposure to reminders.

Of note, we also found that the parents of survivors experienced high levels of emotional distress post-terror, including symptoms of posttraumatic stress, anxiety, and depression (Thoresen, Jensen, et al., 2016). Eight years post-attack, a substantial minority of caregivers still reported high levels of PTSD symptoms (Dyb, et al., forthcoming). These findings are in line with the limited literature in the field on reactions among people in the immediate social network of survivors (Salguero, Fernandez-Berrocal, et al., 2011; Scrimin, Axia, et al., 2006) and illustrate how caregivers may suffer severe emotional traumatization from learning of life threat to their children (Haga, 2019).

## 2. Traumatic Loss

Given the brutal nature of terrorist attacks, levels of mortality can be high. Whereas grief is a normal response to the loss of someone close, traumatic loss (e.g., by a terrorist attack) can lead to severe and persistent psychological reactions, including symptoms of complicated grief. The hallmark of complicated grief is “persistent, intense yearning, longing and sadness, usually accompanied by insistent thoughts or images of the deceased and a sense of disbelief or an

## Survivors and the Aftermath of the Attack on Utøya Island

inability to accept the painful reality of the person's death" (Shear, 2015: 154). While the dual burden of direct traumatization and traumatic loss is characteristic of terrorist attacks, few have explored the combined psychological consequences (Neria & Litz, 2003).

In the Utøya Study, 275 survivors had lost someone close (a family member, partner, and/or close friend) in the attack. We explored the longitudinal association between symptoms of PTSD and complicated grief reactions among these bereaved survivors (Glad, Stensland, Czajkowski, et al., 2021). As hypothesized, we found that participants who reported higher levels of complicated grief also reported higher levels of PTSD symptoms. From analyses of our longitudinal data, we found that posttraumatic stress symptoms predicted complicated grief reactions, but not vice versa. This supports the hypothesis in the field that PTSD reactions may disrupt the mourning process and affect to the severity of complicated grief symptoms (Nakajima, Ito, et al., 2012; Schaal, Jacob, et al., 2010).

### 3. Somatic Health

Through infliction of death, injury, and destruction of physical and social environments, mass casualties may violate all aspects of survivors' health, including their physical, mental, and social well-being. Although these aspects of health are heavily entangled post-trauma (Asmundson & Katz, 2009), symptoms originating from or relating to the body, or *soma*, are commonly differentiated from those previously described, which relate to the mind, soul, spirit, or *psyche*. In the aftermath of mass casualties, somatic symptomatology in survivors may result directly from inflicted injuries from gunshots, explosions, falling objects, falls, or exposure to a range of other physical, chemical or biological hazards (i.e., entrapment in cold water potentially causing severe hypothermia or (near-)drowning) (Lippmann, Cohen, & Chen, 2015; Lucchini, Hashim, et al., 2017; Neria, Wickramaratne, et al., 2013). Among survivors of the Utøya Island shooting, the most severe injuries were caused by gunshots (Gaarder, Jorgensen, et al., 2012; Sollid, Rimstad, et al., 2012), whilst survivors' less severe injuries were largely related to falls incurred during flight (Bugge, Dyb, et al., 2017).

In the early aftermath of exposure to traumatic events, survivors commonly experience frequent headaches, pain, palpitations, insomnia, or fatigue (Kizilhan & Noll-Hussong, 2017). Such symptomatology has largely been understood as *transient*, fear-related, physiological or somatic reactions to exposure to life-threatening events. As these early somatic symptoms to a

large extent have been expected to go away on their own, they have mostly been overlooked in the early phase post-trauma, with no recommendation of systematic mapping or follow-up (Bisson, Berliner, et al., 2019; Goldmann & Galea, 2014; Koenen, Sumner, et al., 2017).

However, over the last decades, results from retrospective studies have provided evidence that survivors of trauma more commonly experience long-term somatic health problems and illness compared to non-exposed peers. Whilst these adverse long-term somatic health outcomes have predominantly been seen as sequelae of persistent posttraumatic stress or PTSD (Koenen, Sumner, et al., 2017; Pacella, Hruska, & Delahanty, 2013; Schnurr & Jankowski, 1999), there is a possibility that early somatic symptomatology could play an important role as early predictors of long-term complaints. For example, high levels of somatic symptoms and related functional impairment in the early phase post-trauma could compromise survivors' capability to take on everyday tasks, such as preparing and eating healthy meals, ensuring good sleep routines, and avoiding overreliance on pain medication or alcohol, and thereby hinder recovery. This hypothesis is supported by results from large epidemiological studies, which indicate that frequent headache, pain, and other somatic symptoms contribute to considerable functional impairment (Bilevicius, Sommer, et al., 2018; Mokdad, Forouzanfar, et al., 2016). Importantly, however, the role of somatic symptoms potentially impeding recovery in the early posttraumatic phase is not systematically accounted for in current guidelines (Bisson, Berliner, et al., 2019) or in clinical practice.

Among the Utøya survivors, headaches, fatigue, and lumbar pain were the most frequently reported somatic symptoms in the early post-trauma phase (Stensland, Thoresen, et al., 2020). As headaches were the most frequent, early complaint and are known to cause considerable disability (Vos, Flaxman, et al., 2012), Stensland, Zwart, et al. (2018) explored the effect of terror on risk of headache in a case control study of the adolescent survivors as compared to matched population-based controls. Their findings clearly show that survivors of the terrorist attack on Utøya Island had a four times higher risk of weekly and daily migraines and tension-type headaches compared to controls. Further, Stensland, Thoresen, et al. (2020) investigated how somatic symptomatology, such as headache, stomachache, other musculoskeletal pain, palpitation, faintness, and fatigue, relates to posttraumatic stress symptoms over time. Unexpectedly, Utøya survivors' early somatic symptoms predicted later posttraumatic stress reactions. This finding is at odds with current theory and practice that assumes symptoms

## Survivors and the Aftermath of the Attack on Utøya Island

of PTSD precede the development of adverse somatic health outcomes after trauma (Andreski, Chilcoat, & Breslau, 1998; McLaughlin, Basu, et al., 2016; Pacella, Hruska, & Delahanty, 2013; Schnurr & Jankowski, 1999). The findings of Stensland, Zwart, et al. (2018) and Stensland, Thoresen, et al. (2020) thus suggest that early identification of survivor's somatic symptoms and provision of adequate related services may improve and increase the efficiency of post-trauma interventions.

#### 4. Sleep Problems

The disruption of normal sleeping patterns can impact on everyday functioning as well as impair physical and mental health (de Zambotti, Goldstone, et al., 2018; Sivertsen, Harvey, et al., 2014). Adolescence and early adulthood are particularly vulnerable times for sleep disruption, as is the period following a traumatic event. In the first months and years post-trauma, high rates of sleep disturbance have been reported in children and adolescents: for example, following a 1984 shooting in an elementary school playground in Los Angeles, 77% of the school children (n=159) reported sleep disturbances 1 month (Pynoos, Nader, et al., 1987), and 58% 14 months after witnessing the sniper attack (Nader, Pynoos, et al., 1990). A recent analysis assessing sleep disturbance 1, 1.5, 2, and 2.5 years after the 2008 Wenchuan earthquake identified five trajectories in a trauma-exposed adolescent population (Zhou, Zhen, & Wu, 2019). The majority of survivors showed stable sleep disturbance over this 2.5-year span, with 68% having little sleep disturbance throughout and 10.8% consistently having high levels of sleep disturbance. Of note, in all existing studies where the association between sleep and posttraumatic symptomatology has been directly assessed, insomnia or sleep disturbance was associated with higher rates of PTSD or PTSD symptomatology (Grønli, Melinder, et al., 2017; Geng, Liang, et al., 2019; Fan, Zhou, & Liu, 2017). In most cases of longitudinal analysis, insomnia has correlated with later PTSD (Zhang, Zhang, et al., 2020; Geng, Liang, et al., 2019; Fan, Zhou, & Liu, 2017).

The Utøya Study assessed insomnia among 336 survivors at 2.5 years (T3) and 8.5 years (T4) after the attack (Porcheret, Stensland, et al., 2022). Almost a decade after the terrorist attack, nearly a half of the young survivors still reported insomnia. This rate was almost double what is reported in the general population (20–30%), indicating a high level of unmet need among the Utøya survivors. The implications of such sleep disruption among young people during a critical time for physical, mental, social, and cognitive development are far-reaching.

### 5. Impaired Daily Functioning

Given the major impact that exposure to a terrorist attack may have on survivors' mental and somatic health, it is not surprising that it also can affect their daily functioning, such as their ability to do household chores, to take part in personal interests and activities, and to get along with family and friends. Terror exposure can also impair the academic performance of survivors and their well-being in school. In a recent review of the literature on school-related outcomes of trauma, Perfect, Turley, et al. (2016) reported that many studies have found significant associations between trauma exposure and related PTSD symptoms among youth and impaired cognitive functioning, lower academic performance, and social-emotional-behavioral problems. Clearly, such outcomes may have detrimental, long-lasting impact on young trauma survivors' lives, for example, in terms of their future careers.

Almost half of the Utøya Study survivors reported that they found it very difficult to perform their everyday tasks, and approximately 25% said they were less interested in the things they used to do before the attack (Glad, Aadnanes, & Dyb, 2012). Furthermore, about 10% said that it had become much more difficult to get along with their family and friends (Glad, Aadnanes, & Dyb, 2012). Many of the survivors were part-time or full-time students, and we found that 61% reported impaired academic performance, and 29% reported impaired school well-being (Stene, Schultz, & Dyb, 2018). In a qualitative interview of 65 students in the Utøya Study (aged 16–29 years), a majority of students (69%, n=45) reported negative changes in their academic performance, particularly difficulty concentrating and a failure to remember what they had just read (Schultz & Skarstein, 2020). For example, one girl in her final year of high school said:

Everything fell apart! It used to take me one minute to read a page, maybe half a minute. But now I had to read the page over and over again. I spent 20 to 30 minutes on a page – I'm not kidding. I just sat there staring at it, reading over and over, trying to make it stick. And in math ... well, I simply couldn't concentrate [...] Everything went so slow. I used to have top grades, and then I ended up with Cs. My plans for university were blown ... just like that (Schultz & Skarstein, 2020: 5).

These findings demonstrate both how exposure to a terrorist attack can negatively affect young survivors' academic performance and well-being at school and the potential long-lasting impact on careers and life paths. When asked to what extent they were back to normal functioning in various life areas eight years after the attack, two thirds of the survivors answered that they were back in relation to school, studies, and work and/or in relation to family (Dyb, et

## Survivors and the Aftermath of the Attack on Utøya Island

al., forthcoming). About 50% said they were completely back in normal function in their spare time and in relation to friends. The fact that so many reported that they were *not* back to normal functioning almost a decade post-terror shows how long-lasting such impairment can be.

## 6. Media Attention, Compensation, and the Trial

### *A. The Impact of Media Attention on Survivors*

The Utøya survivors received considerable media attention after the attack. In fact, almost everyone who participated in our study said that journalists had contacted them, and 88% had given interviews about their experiences on Utøya Island (Thoresen, Jensen, & Dyb, 2014). The third-wave interviews of the Utøya Study (30–32 months after the attack) asked about survivors' personal experiences with the media in more detail, and the written descriptions of media experiences of 235 survivors were analyzed (Glad, Thoresen, et al., 2018). Of the 261 youths who participated, 192 (73.6%) described an experience with the media's approach, the interview, or the coverage. As many as 90% described negative experiences with the journalists' approach. A recurring theme was that, in approaching the survivors, the journalists had neither shown respect nor been considerate but rather invasive. For example, one survivor stated:

My first encounter with the media was pretty negative. There was a meeting that day when the entire press corps was outside, and the camera flashes were going like crazy in the room where we were trying to take care of each other and grieve. It annoyed me so much. [...] Basically, it was rough that we didn't even get 12 hours to process what had just happened (Glad, Thoresen, et al., 2018: 7).

In relation to interviews, journalists were mostly described as both caring and considerate, while the survivors' accounts of their experiences with the media's coverage of their stories were more mixed. Positive experiences included being pleased with the angle of a story or being given opportunity to read articles before publication. Others reported negative experiences, e.g., that the angle of their story had been excessively negative or overly dramatic, or that their story or photo had been published without their consent. For some, it had been a burden to be recognized in the public as a result of the media attention (Glad, Thoresen, et al., 2018).

### *B. Compensation for Victims of Violent Crime*

According to Norwegian law, a person who is victim to a criminal act that violates life, health, or liberty may be entitled to compensation from the state. This compensation covers three areas:

## Survivors and the Aftermath of the Attack on Utøya Island

compensation for permanent and significant injury, compensation for financial loss, and damages for non-economic loss. We interviewed survivors about receiving the latter (Nilsen, Langballe, & Dyb, 2016). Everyone who was on Utøya during the terrorist attack was eligible to apply for compensation, and approximately three years after the attack (T3), 99% reported that they had applied. Due to the high number of victims, the settlement after the terrorist attack was based on an appraisal of pilot cases that were meant to represent different groups of affected individuals. Based on these cases, survivors from Utøya were divided into three groups, which received different amounts based on their level of physical injury.

In the Utøya Study, we wanted to investigate how Utøya survivors experienced receiving such state compensation. More specifically, we were interested in learning more about how the survivors understood the state compensation scheme and what significance it had for them to receive damages for violence. We found that receiving damages for violence was significant for many of the Utøya survivors (Nilsen, Langballe, & Dyb, 2016). At the same time, our results also resonated with previous studies that have suggested that victims of violent crimes have uncertainties regarding why they receive damages for violence (Dahlstrand, 2012). For this reason, we saw that it is important that victims of violent crime receive clear information about why they are receiving monetary compensation. This information should be unambiguous and be presented to all the offended. We also know from previous studies that in order for individual victims to experience a sense of justice, it is central that everyone's stories are seen and heard (Wemmers, 2010). Administrative justice arrangements, such as the crime compensation scheme, can appear impersonal and objective. It is therefore also important that individual victims receive customized information and personalized answers to their questions, for instance from a counsellor or a contact person. In our study, we found that for some, it was helpful to learn more about the principles behind the state compensation scheme and how specific monetary amounts are calculated for damages for violence (Nilsen, Langballe, & Dyb, 2016). Such steps may ease negative feelings, such as shame or ambivalence about receiving compensation. For others, advice about financially managing the compensation allocation may be more useful. For them, this could mean that the compensation is perceived as support rather than becoming an additional concern on the top of other problems (Nilsen, Langballe, & Dyb, 2016).

## Survivors and the Aftermath of the Attack on Utøya Island

*C. The Trial and Testifying in Court*

In the Norwegian legal system, victims have a range of participatory rights. Most of these rights were implemented in 2008, when the authorities proposed changes to the legal status of victims (Ot.prp. nr. 11 2007-2008). The amendments included the right to have a legal representative in all cases in which the victim has suffered serious injury to body or health caused by a criminal act. The legal representative is to safeguard the victim's interests during both the investigation and the trial. This means that the victim's lawyer must inform the victim of developments in the case, prepare the victim for the trial (particularly in relation to legal testimony), and support the victim during trial by speaking on behalf of the victim and participating in the cross-examination of the victim, the accused, and other witnesses (NOU2006:10).

The number of victims and survivors involved in the court case after the Utøya Island attack was of a size never seen before in Norway (Langballe, Nilsen, & Schultz, 2019). Oslo District Court began the extensive work of preparing for the trial immediately after the attack. The trial started on 16 April 2012 and lasted for ten weeks. Due to the large scale of the case, survivors were selectively called to testify in person. In total, 45 survivors gave testimony: 12 who had witnessed murders on Utøya Island; and another 33 who had themselves been shot, injured, or otherwise survived direct attempts on their lives (Langballe, Nilsen, & Schultz, 2019). In this particular case, in addition to receiving a legal representative, the court also facilitated visits so that the survivors could familiarize themselves with the courthouse before the trial and arranged meetings between the prosecution and the survivors.

As part of the Utøya Study, we interviewed 31 of the survivors who testified in the trial. The main impressions provided by their stories were that it was important to them to testify and that they seemed to be satisfied with the support they had received (Laugerud & Langballe, 2017). They voiced the importance of having the opportunity to actively participate in the legal trial by giving testimony (Laugerud & Langballe, 2017). Although they described the courtroom as an intimidating arena, they also described how the court case gave them opportunities to regain control and exercise power over the perpetrator as a match they could win (Laugerud & Langballe, 2017). Laugerud and Langballe (2017) found that the following five general themes emerged from the young people's accounts of their experiences testifying in court:

- They did not want to reveal to the perpetrator how the injuries he had inflicted on them affected their lives.

## Survivors and the Aftermath of the Attack on Utøya Island

- They were unsure of how to word their testimony so as not to offend other victims.
- They were afraid of making formal mistakes and needed a lot of assistance from their legal representatives.
- They felt that the trial gave them an opportunity to regain control and take power back from the perpetrator.
- They developed strategies for communicating indirectly, on a symbolic level. For example, some survivors deliberately dressed in clothing that made their scars visible, rather than wearing clothes that were more in line with the courts' formal dress code. These summer outfits (t-shirts, shorts, and sundresses) stood in sharp contrast to what the scars on their bodies told of the horror that had unfolded on the island. This again was a way for the youth to show the perpetrator that they were standing there, upright, despite their wounds.

Apart from collecting these stories, the study did not explore whether the process of testifying affected the survivors' recovery.

## V. IMPACT ON FIRST RESPONDERS

Terrorist attacks clearly affect the directly exposed victims and their families, but in addition, first responders often witness atrocities. This can result in psychopathology, including PTSD. In a meta-analysis of PTSD, Berger, Coutinho, et al. (2012) found that first responders experience traumatic events repeatedly and report more current PTSD (10%) than the general population (3.5%). Several potential risk factors for PTSD among first responders have been identified, including losing someone or knowing someone injured, number of pre-trauma stressors, and shortage of supplies and resources (Declercq, Meganck, et al., 2011; Pietrzak, Schechter, et al., 2012). Other risk factors include subjective experience of intense fear, helplessness, or horror during the traumatic event (Declercq, Meganck, et al., 2011). On the other hand, union membership and greater family support while working on site has been found to play a protective role (Pietrzak, Schechter, et al., 2012).

After the attacks in Oslo and on Utøya on 22 July 2011, 1790 first responders, including health care personnel, police officers, firefighters, and affiliated and unaffiliated volunteers responded to a self-reported questionnaire (Bogstrand, Skogstad, & Ekeberg, 2016). The researchers found that firefighters and unaffiliated volunteers reported more perceived threat compared with the other groups. Among the professional personnel, the prevalence of sub-threshold PTSD was 2% and possible PTSD 0.3%, while figures among the unaffiliated

## Survivors and the Aftermath of the Attack on Utøya Island

volunteers were 24% and 15% respectively. The results indicate that professional rescue workers are more protected from post-traumatic stress reactions than unaffiliated volunteers. The same study found low levels of alcohol and medicinal drug use among the rescue workers after the terror attacks, but notably, a strong association was found between both medicinal drug and alcohol use and elevated levels of posttraumatic stress reactions (Bogstrand, Skogstad, & Ekeberg, 2016).

## VI. IMPACT ON THE WIDER COMMUNITY

Terrorism may create fear and provoke stress reactions not only in the direct victims but also in the general population. Thoresen, Aakvaag, et al. (2012) have investigated the emotional responses in the Norwegian population following the 22 July terrorist attacks. Representative samples were drawn from the Norwegian Population Registry, and telephone interviews were conducted 4–5 months after the attacks. We found that the terrorist attacks seem to have had a significant effect on the Norwegian population, creating grief and insecurity, at least in the short term. Proximity to the terrorist attacks was strongly associated with distress in the population, and early distress was strongly related to later post-traumatic stress reactions. Thoresen, Aakvaag, et al. (2012) found that psychological proximity (e.g., being worried about the safety of close ones, knowing someone at a site of attack, or knowing first responders at a site of attack) was even more strongly associated with post-traumatic stress reactions than geographical proximity to the terror attack sites, underscoring the importance of differentiated measurements of various aspects of early distress. This study also mapped participation in ceremonies for the terrorist attack victims, such as if the respondent had: (1) lit candles/laid flowers; (2) taken part in a flower march/torch march; (3) taken part in gatherings at churches or mosques; (4) sent/signed condolence messages; (5) taken part in memorial services; or (6) taken part in other ceremonies or rituals. The vast majority of the respondents, both in and outside Oslo, had taken part in various ceremonies in honour of the terror victims. The Prime Minister, the King and his family, other ministers, religious leaders, and authorities at state, county, and municipality levels also took part in numerous ceremonies around the country to honour the victims and their families and strengthen resilience in the society.

Another Norwegian study analyzed register data on different negative health outcomes in the Norwegian population (Strand, Mukamal, et al., 2016). This study found an increase in

adverse health outcomes (schizophrenia/psychosis hospitalizations, suicides, acute myocardial infarctions) in the first four weeks after the terror attack, indicating that adverse health outcomes may accompany national stressors.

## VII. STUDY FOLLOW-UP AND IDENTIFIED GAPS

For participants in our study, the national outreach program seemed to have worked well in the first phase after the Utøya attack (Nilsen, Stene, et al., 2017). For example, at 4–5 months post-terror, 87% of participants reported that they had received early and proactive outreach from their municipalities, and 84% reported that they had been contacted by their contact person (Dyb, Jensen, Glad, et al., 2014). In addition, in a qualitative study in which we explored how the caregivers of the survivors had experienced the follow-up, the majority reported that their children had been proactively contacted by health services (Glad, Jensen, & Dyb, 2014). That said, the most salient theme across the interviews with caregivers was a wish for a more active and enduring follow-up, especially for siblings and the family as a whole (Glad, Jensen, & Dyb, 2014). For example, one mother stated:

I have missed help from the municipal crisis team beyond a single conversation. We have not received follow-up locally—no one has contacted us as a family after the first week. We had to get help ourselves and feel forgotten by the municipality! (Glad, Jensen, & Dyb, 2014: 541)

Similarly, in a qualitative study on how the directly affected survivors themselves assessed the outreach from the public health care services, many expressed that the outreach disappeared too quickly and that the follow-up had not been proactive enough (Nilsen, Stene, et al., 2017). At 4–5 months post-terror, 14% of the survivors reported unmet need for services (Dyb, Jensen, Glad, et al., 2014). At the third interview wave (approximately 2.5 years post-terror), one in five survivors reported unmet needs for their psychological reactions, and one in seven for attack-related somatic health problems (Stene, Wentzel-Larsen, & Dyb, 2016). Unmet healthcare needs were associated with higher levels of posttraumatic stress, depression/anxiety, somatic symptoms, and low social support. Survivors with non-Norwegian origin reported more unmet needs for attack-related physical health problems and were less satisfied with post-terror healthcare (Stene, Wentzel-Larsen, & Dyb, 2016). At the fourth interview wave (approximately eight years post-terror), about one in three survivors reported that they needed follow-up from new help services or reinforcement of existing measures (Dyb, et al., forthcoming).

## Survivors and the Aftermath of the Attack on Utøya Island

Of note, Haga, Thoresen, et al. (2017) found that the parents of Utøya survivors experienced a wide range of healthcare needs after the attack. In terms of healthcare consumption among the caregivers, the frequency of primary healthcare service consumption increased significantly for the caregivers of the directly affected in the early aftermath of the attack (0–6 months) and remained significantly elevated through the following 30 months (Haga, Thoresen, et al., 2017). The increase in consumption of primary healthcare services, both in the early and delayed aftermath, largely entailed psychological health complaints, particularly depressive symptoms and PTSD, as recorded by primary healthcare providers (Haga, Thoresen, et al., 2017).

On 21 August 2011, a National Support Group was established to promote the interests of those directly affected by the 22 July terrorist attacks.<sup>3</sup> In October 2019, this group conducted a survey to find out how the directly affected were doing (Støttegruppen 22.juli, 2019). The report uncovered shortcomings in the follow-up and considerable unmet needs. As a response, a regional support program (Los-funksjonen) was established in 2019 (RVTS vest, 2021). The five already existing Regional Resource Centers for Violence, Traumatic Stress and Suicide Prevention (RVTS) in Norway were given the responsibility for implementing this support function regionally, with the aim of contributing to psycho-social support and care for the directly affected when needed. As part of this program, the RVTSs are responsible for helping the National Support Group in making the regional support program known among the directly affected, informing them about relevant services and offering assistance for follow-up (e.g., helping to establish contact with relevant services) (RVTS vest, 2021).

## VIII. SUPPORT NEEDED BY SURVIVORS AND FAMILIES OF VICTIMS OF A MASS CASUALTY

An important factor associated with how survivors cope after a mass casualty such as a terrorist attack is the support and help they receive, not just from their familial and social networks but also from the healthcare system and social services. In a society targeted by a mass casualty, questions immediately arise as to how it will affect the bereaved, the survivors, their families, and the community, and how authorities should respond. Unfortunately, findings from

---

<sup>3</sup> See the website of the support group, Støttegruppen 22.juli, <https://22juli.info/english/> (accessed 25 March 2022).

international studies on disasters such as 9/11 suggest that many people directly and indirectly affected by mass casualties do not receive the help they subsequently need from the healthcare system (e.g., DeLisi, Maurizio, et al., 2003; Norris, Friedman, & Watson, 2002; Stuber, Galea, et al., 2006). We also know that many who are affected do not seek help when they need it (Schwartz & Kowalski, 1992; Stuber, Galea, et al., 2006; Weiseth, 2001). As such, proactive follow-up support is recommended after large-scale disasters (Brewin, Scragg, et al., 2008). Early outreach may reduce future unmet needs by providing initial psychosocial and practical support, monitoring healthcare needs, and facilitating access to healthcare services (Call & Pfefferbaum, 1999; Stuber, Galea, et al., 2006).

In contrast to regular healthcare, the idea of outreach is to engage proactively and universally with the population of target, regardless of medical history and apparent levels of distress (Haga, Stene, et al., 2015). In the following, we briefly describe some recommendations for support and follow-up for people affected by large-scale disasters, based on a post-trauma timeframe that includes immediate (acute), medium-term (intermediate), and long-term phases.

### 1. The Acute Phase

Psychosocial responses should be tailored for each specific disaster, taking into account the type of disaster, the impact on the population, and the structure of existing health care systems (Reifels, Pietrantonio, et al., 2013). Also, response plans must be flexible, and resources should be provided according to demands. To date, we have little empirical evidence for useful interventions in the first hours and days after the incident, often referred to as the *acute phase*.

Recommendations are mostly based on theories, consensus documents, and clinical experiences (Fox, Burkle, et al., 2012; Hobfoll et al., 2007). Several models have been used in outreach programs after disasters (for overviews, see Michel, 2014; Shultz & Forbes, 2013).

Psychological First Aid, for example, is a modular form of treatment (Brymer, Jacobs, et al., 2006) widely used for acute intervention after crises and disasters (Forbes, Fletcher, et al., 2010). This evidence-informed modular approach was developed to help people in the immediate aftermath of disaster and terrorism. The aim is both to reduce initial distress responses and to foster short- and long-term adaptive functioning and coping (Brymer, Jacobs, et al., 2006). Major organizations have endorsed this intervention, including the American Psychological Association (American Psychological Association, 2019) and the World Health Organization (WHO, 2011).

Survivors and the Aftermath of the Attack on Utøya Island

Psychological first aid is summarized on the National Child Traumatic Stress Network (NCTSN) website as the following eight core actions:<sup>4</sup>

**1. Contact and engagement**

Goal: To respond to contacts initiated by survivors, or to initiate contacts in a non-intrusive, compassionate, and helpful manner

**2. Safety and comfort**

Goal: To enhance immediate and ongoing safety and to provide physical and emotional comfort

**3. Stabilization (if needed)**

Goal: To calm and orient emotionally overwhelmed or disoriented survivors

**4. Information gathering: Current needs and concerns**

Goal: To identify immediate needs and concerns, gather additional information, and tailor Psychological First Aid interventions

**5. Practical assistance**

Goal: To offer practical help to survivors in addressing immediate needs and concerns

**6. Connection with social supports**

Goal: To help establish brief or ongoing contacts with primary support persons and other sources of support, including family members, friends, and community helping resources

**7. Information on coping**

Goal: To provide information about stress reactions and coping to reduce distress and promote adaptive functioning

**8. Linkage with collaborative services**

Goal: To link survivors with available services needed at the time or in the future

**2. The Intermediate Phase**

Many survivors and families of victims will need help beyond the acute phase. In the weeks after the traumatic event (often called the intermediate phase), the overall goal is to help those affected acquire skills to reduce stress, solve problems, and prevent symptoms from developing. It is recommended that interventions in this phase are directed towards the following three areas in particular (Kassam-Adams, 2014).

<sup>4</sup> See the NCTSN webpage, <https://www.nctsn.org/treatments-and-practices/psychological-first-aid-and-skills-for-psychological-recovery/about-pfa> (accessed 27 January 2022).

### *A. Preventing Negative and Maladaptive Thoughts*

First, it is important to prevent those affected from developing negative thoughts, such as thinking that the world is dangerous or that other people wish them ill (Jensen, Stene, et al., 2019). Many such thoughts can be more or less erroneous interpretations of reality, and they have been shown to maintain post-traumatic stress (Diehle, Schmitt, et al., 2014; Jensen, Holt, Ormhaug, Fjermestad, & Wentzel-Larsen, 2018; Meiser-Stedman, McKinnon, et al., 2019).

### *B. Avoiding Poor Coping Strategies*

Many traumatized people have re-experiences or flashbacks (i.e., they experience something as if the traumatic event is happening again, here and now); they may sleep poorly; they may have headaches or muscle tension (Jensen, Stene, et al., 2019). The ways some survivors try to deal with such painful and frightening responses can themselves be problematic and in fact exacerbate their difficulties, for example, when people use sedatives or sleep-aid drugs to calm down or fall asleep. Learning positive and alternative coping strategies, such as muscle relaxation techniques, breathing exercises, positive self-talk, etc., can help the mind become less troublesome and prevent unhealthy coping strategies from creating new difficulties (Jensen, Stene, et al., 2019).

### *C. Maintaining Social Relationships*

Finally, it is important that those affected by a mass casualty event do not isolate themselves and are helped to maintain positive social relationships. Good social support has proven to be important for healing after trauma (see, e.g., Charuvastra & Cloitre, 2008), but many are reluctant to accept support even when it is there; moreover, friends and family may be unsure of how to provide support. Some survivors also experience negative reactions from their surroundings and shield themselves from social contact (Arnberg, Hultman, et al., 2013). Therefore, it is important to explore reasons for isolation and lack of social support, so that later difficulties can be prevented (Jensen, Stene, et al., 2019).

## **3. Long-term Phase**

For individuals in need of more extensive help, targeted responses should be provided (O'Donnell, Lau, et al., 2012; Zatzick, Roy-Byrne, et al., 2004). Specialized health care services

## Survivors and the Aftermath of the Attack on Utøya Island

need to be involved if victims develop PTSD or other health care or social problems (such as long-term sleep problems, a reduction in functioning level, social isolation, excessive use of alcohol or drugs, or a reluctance to engage in daily activities). Specialized treatment protocols are recommended in up-to-date guidelines (see International Society for Traumatic Stress Studies (ISTSS), n.d.); National Institute for Health Care Excellence (NICE), 2022). Survivors and families exposed to mass casualties may need specialized health care services years after the incident, as documented in the Utøya Study and outlined above (see also Haga, Thoresen, et al., 2017; Stene, Wentzel-Larsen, & Dyb, 2016).

## IX. RECOMMENDATIONS

The terrorist attack on Utøya Island had long-term health implications for those directly affected, including high levels of PTSD reactions, anxiety, depression, complicated grief, headaches, and other pain and somatic symptoms. It also impacted the daily functioning of survivors, including their ability to study and their interpersonal relationships. These impacts on functioning may be caused by the psychological and physical consequences of the trauma, but they can also be related to insufficient outreach from health and social services and inadequate support and awareness from schools, workplaces, families, and friends (Glad, Stensland, & Dyb, 2021).

The recommendation to municipalities and specialized health care services in the national outreach plan from the health authorities after the terrorist attack was that proactive follow-up should last for one year. However, our findings clearly show that many survivors struggled for several years post-terror, and the need for help extended well beyond the first year. This is in line with findings from a recent systematic study on PTSD post-terror (García-Vera, Saz, & Gutiérrez, 2016). As such, we recommend that a core principle for follow-up after future major terrorist attacks should be long-term assistance and aid. The Utøya Study also revealed that many survivors, even those who were not physically injured, experienced somatic complaints that required treatment. Current recommendations for preparedness planning focus primarily on assessment and interventions targeting psychological symptoms (e.g., Bisson, Berliner, et al., 2019). These should be revised to encompass identification and accommodation of survivors' psychological *and* somatic reactions and needs (Stensland, Thoresen, et al., 2020).

After the 22 July 2011 terrorist attack, most outreach concentrated on helping those who survived. However, importantly, and in line with a recent systematic review on traumatic

reactions post-terror (García-Vera, Saz, & Gutiérrez, 2016), we found that the people close to those directly affected, such as their caregivers, can themselves be traumatized and develop post-trauma health problems (Haga, Thoresen, et al., 2017; Thoresen, Jensen, et al., 2016). As such, people in the immediate social network of survivors should be considered “affected” in their own right and receive follow-up (Haga, 2019). In Norway, primary healthcare is the entry point to specialized healthcare, as well as to social benefits and public welfare services. Our figures suggest an important role for general practitioners (GPs) in managing parents’ post-disaster distress. GPs need to be aware that high number of parents may turn to primary healthcare with psychological health complaints in the wake of a terrorist attack or other mass casualty event, which may facilitate appropriate preparation (Haga, Thoresen, et al., 2017).

We also found that survivors with non-Norwegian origins were more likely to report unmet needs for attack-related physical health problems and to be less satisfied with their follow-up experiences (Stene, Wentzel-Larsen, & Dyb., 2016). In the literature, it has been hypothesized that ethnic minorities tend to somatise distress, but findings are inconsistent. Whereas some have not found any difference in somatization by ethnicity (Bekker & Schepman, 2009), others have indicated that somatization is either less common (Bauer, Chen, & Algeria, 2012) or more common (Aragona, Tarsitani, et al., 2005) in ethnic minorities. Other possible explanations for our finding could be cultural or language-related barriers to satisfactory healthcare (Stene, Wentzel-Larsen, & Dyb, 2016). Either way, after future attacks, we recommend that particular attention should be paid to survivors with minority backgrounds. For example, an effort should be made to provide easily accessible information about both the general healthcare system and (if applicable) the services and follow-up that have been made available of the directly affected. Also, to the extent that there may be language barriers, access to interpreters is important.

Exposure to a terrorist attack can be particularly detrimental for young survivors, as it may disrupt their psychosocial development and education, with potential long-term adversity, including impaired academic performance, affecting future career opportunities. Given the long-term disruption and impairment we found in the survivors’ academic performance after Utøya (Schultz & Skarstein, 2020; Stene, Schultz, & Dyb, 2018), it is important that appropriate school support is provided after future attacks. Greater educational follow-up on the part of teachers may offer a good point of intervention with traumatized students (Schultz & Skarstein, 2020). For example, we would recommend that educational psychologists provide counseling for

## Survivors and the Aftermath of the Attack on Utøya Island

teachers, so that they can give psycho-education and help students in exploring their functional study skills to improve their self-efficacy in order eventually to recover their academic functioning (Schultz & Skarstein, 2020).

The media coverage of a terrorist attack can be extensive and long-lasting, but few researchers have explored how media attention may affect survivors. Our results suggest that media exposure can be an extra strain for survivors of mass casualties, particularly for those who are struggling post-terror. As such, journalists need to be careful and considerate when they approach, interview, and report on people exposed to trauma. In addition, we recommend that in the early phase after an attack, survivors should be warned about the media attention they may receive and be briefed on how to handle it. Such information could, for example, be integrated into an outreach program for the directly affected.

## X. CONCLUSION

Mass casualties such as terrorist attacks violate security and feelings of safety. The prevalence of post-traumatic stress reactions, other mental and somatic health problems, and negative social consequences is often substantial among survivors. The results from the NKVTS Utøya Study underline the challenges that survivors and their families face after terrorist attacks. As described in this report, 47% of the survivors had posttraumatic stress reactions on a clinical level 4–5 months after the event. For many, these reactions and other psychological problems lasted for many years. The need for mental health services was substantial, and about 70% required specialized mental health services during the first years. Grief about the loss of friends was complicated by their posttraumatic reactions and interfered with their own healing process. Pain and other somatic symptoms were common and appeared to also complicate recovery from psychological problems. This insight calls for action from decision-makers in providing adequate outreach programs in health and social services. To successfully improve readiness and respond adequately to victims' needs after terrorist attacks, disaster guidelines and future outreach programs must integrate the findings of empirical research. In other words, a systematic, needs-based response to terrorist attacks and other disasters requires the integration of real-time research in preparedness planning. Post-terror outreach should be proactive, long-lasting, and consider the diverse needs and characteristics of the affected individuals, including, for example,

minority background status. Furthermore, the outreach should be broad, targeting people in the immediate social networks, schools, and workplaces of survivors.

## I. Introduction

“Community safety” has moved to the centre of crime prevention discourse and policy worldwide. In part this shift is because the criminological theories that are dominant today draw attention to how community contexts—including built environments, social networks and relations, and structural factors like social inequality—influence crime. The movement toward community safety also reflects the fact that community engagement and bottom-up approaches have become the norm across policy and governance domains, from health to economic development. Unlike crime responses of decades gone by, which prioritized punishing criminals, the community safety approach prioritizes prevention, and not just “situational” prevention but rather the creation of the general conditions known to enhance community safety.

This report examines the extant research on community safety with an eye to drawing insights relevant to rural Nova Scotia. There is ample scholarship on this topic, including empirical studies identifying best practices in community safety and crime prevention, but unfortunately, very little of it takes place in rural communities. Nevertheless, some general lessons from urban research and theory are likely transferable to rural communities, and at the very least, they point toward the need for more rural research, adaptable pilot programs, a comprehensive community safety strategy, and long-term, sustainable investment in locally relevant initiatives.

## Crime Prevention and Community Safety in Rural Communities

## II. Methodology

This report presents the results of three scoping reviews of rural crime prevention and community safety literature, supplemented with more targeted literature reviews to answer questions raised during the process. First, the database *Sociological Abstracts* was searched for the keywords “rural,” “community safety,” and “crime prevention.” This yielded 34 results, 13 of which were removed for being irrelevant (e.g., only focused on urban settings with no utility for rural situations), and the remaining 21 were analyzed. A second search on *Sociological Abstracts* was conducted, this time for only the keywords “rural” and “community safety” in the title or abstract, and limited to peer-reviewed journal articles. This yielded 38,194 results, so the first four pages of results (approximately 100 sources) were scanned for relevance. By the end of the fourth page, relevant articles were few and far between. A third search in *Sociological Abstracts* for the keywords “rural,” “crime,” and “safety” yielded only 43 results, 34 of which were removed immediately for a narrow focus on, for example, food or all-terrain vehicle safety. Once the results of these three searches were analyzed, additional, more targeted searches were performed to answer questions arising and to provide additional details about the Nova Scotia context. These supplementary searches and sources are identified in the text below where relevant, and the bibliography is divided into four sections: one for each set of search terms and one for the supplementary material.

## III. Findings

### 1. The “Community Turn” in Crime Prevention and Safety

Scholars and practitioners reflecting on how crime is understood and addressed across much of the world have noted that from approximately the 1990s to the present, there have been several interrelated shifts in thought and practice that together constitute a “community turn.” The

## Crime Prevention and Community Safety in Rural Communities

primary shift has been toward an emphasis on *community* in criminology, policing, and policy. On one side, this shift has entailed a turn away from offenders (i.e., their traits) toward their environments, both physical (i.e., the built environment, notably in the Crime Prevention Through Environmental Design or CPTED approach) and social (i.e., relationships and social organization). At the same time, criminology has increasingly questioned the utility of punitive approaches—reactive responses to crime, such as criminal prosecution and imprisonment—and instead considered preventative approaches, which seek to identify and mitigate risk factors for crime.

This is not to say that criminology paid no attention to communities before the 1990s. Indeed, the “roots” of two of the most influential environmental criminology theories of the past several decades, social disorganisation and collective efficacy, “go back, in part, to the theorising of Durkheim and Tonnies” in the late 1800s and early 1900s (Donnermeyer 2015: 161). Those two theorists were fundamentally focused on the structures and relationships within communities and how those shape individual behaviour.

The shift toward community after the 1990s, however, has entailed a recognition that communities should be engaged in defining and working on crime, requiring a movement away from centralized, top-down crime responses toward localized, bottom-up ones (Gilling et al. 2013: 335). This approach, along with the more generic recognition of community factors and the emphasis on prevention rather than (or in addition to) punishment, come together under the umbrella of “community safety.” The term seems straightforward, but it connotes something very important and actually quite complex about the way crime is understood and about assumptions regarding how it should be dealt with. Where once the norm may have been for police alone to deal with crime through “situational crime prevention” (Gilling 2001: 381)—using intelligence and surveillance to intervene to stop a specific crime from happening—the community safety

## Crime Prevention and Community Safety in Rural Communities

approach involves a broader range of stakeholders working together at the community level to identify and mitigate risk factors for crime, toward goals that run the gamut from criminal justice and risk management to restorative and social justice (Gilling et al. 2013: 337). As Gilling has noted, “community safety” is still a “preventionist discourse,” but it targets more general “risk factors” like “unemployment, bad housing and low educational attainment” (2001: 382), as well as more intangible things like “‘quality of life,’ which derives from [community members’] personal safety and their sense of security in everyday life” (Hope 2005: 375). Even the focus of the community safety approach on socioeconomic factors has evidently intensified in practice over time: Menichelli (2020) examined UK community safety plans and found, from the 2000s onward, a decreased emphasis on antisocial behaviour and enforcement (except in such things as violence against women and sexual offences) and an increased emphasis on “safeguarding,” supporting (and educating) vulnerable populations (47). *Why* enforcement still plays “an important role” with regard to domestic violence and sexual offences, the authors do not discuss any further.

With its 2002 “Guidelines for the Prevention of Crime,” the United Nations endorsed and influenced the shift toward community safety internationally, including in Canada (Leonard et al. 2005). Updated in 2014, the UN document defines crime prevention as “encompass[ing] a wide range of approaches” from “social, economic, health and educational measures” that “promote the well-being of people and encourage pro-social behaviour” to changing “neighbourhood conditions” that facilitate crime, preventing situational crime through, for example, better environmental design, supporting victims, and working with offenders to prevent recidivism (United Nations 2014: 4–5). Common to all of these varied approaches is the “active participation of communities and other segments of civil society.” The document insists that “communities, in particular, should play an important part in identifying crime prevention

## Crime Prevention and Community Safety in Rural Communities

priorities, in implementation and evaluation, and in helping to identify a sustainable resource base” (6).

Despite the apparent international consensus on community safety, it remains the subject of debate in criminology. The first key critique is that “safety” and “prevention” entail assumptions about who or what is risky, and efforts to prevent risk from materializing can be stigmatizing and marginalizing to certain places, activities, or social groups (Denney 2003; Feenan 2000). The second is a “powerful critique of most, if not all, things ‘communitarian’” (Hughes 2004: 431), which calls into question “moralising accounts of community” and urges that they be replaced with more “progressive” ones (431–32). The problem with appeals to community is that they may be conservative. In other words, they may lament a loss of a former kind of community (e.g., where social cohesion came from rigid gender roles and ethnic and religious similarity) and fail to appreciate the ways in which community is simply evolving. They may also draw attention disproportionately to the way individuals in a community interact with one another and thereby downplay more structural issues such as poverty and inequality. As Crawford has argued, the “community safety” approach draws on

the presupposition that the contemporary crime problem is in part associated with the decline of community as the mainstay of social life. As such, [proponents] seek to encourage a stronger and more participatory civil society... However, in this article I wish to cast a critical eye over some of the (often ignored) assumptions which underlie recent appeals to community in crime prevention and control and their potential implications for future social relations... I identify and review the implications of three particular areas of special attention: first, the increasing social and spatial polarisation and concentration of poverty and wealth; secondly, the commodification of security; and thirdly, policy debates concerning a growing “underclass.” Finally, I question the extent to which crime is an appropriate vehicle around which to (re)construct open and tolerant communities (Crawford 1999: 512).

A third and most prominent critique of the community safety approach is that it devolves responsibility for crime prevention down to the level of communities, or worse, to individuals, without adequately resourcing them to take on this work. Moreover, this “responsibilization”, according to its critics, “enables the development of a wider net for governing so that ‘the state is

## Crime Prevention and Community Safety in Rural Communities

not, and cannot effectively be, responsible for preventing and controlling crime” (Garland 1996: 453, quoted in Sanders & Langan 2019). The critique of responsabilization is found throughout the community safety literature (Mols & Pridmore 2019; Super 2016). For example, Hope (2005) has noted that the community turn in crime prevention has gone hand in hand with a responsabilization of communities for their own safety. Feenan (2000) has also noted a turn toward “community” in crime prevention, which in Britain has meant downloading authority for crime to local actors and has accompanied a shift toward “risk management” rather than crime prevention. In Canada, Sanders and Langan (2019) have found an example of responsabilization in the form of Ontario’s “Situation Tables.” The initiative, created in an effort to get at the “roots” of crime (566), convenes regular meetings between community agencies, human services professionals, and police. The community agencies report on clients whose risk level—their risk of committing a crime or being the victim of one—is “elevated” to the point that the agency cannot manage it alone (570). The possible risks are entailed in a list of 26 categories, ranging from substance abuse and mental illness to anti-social behaviour. In response, the Situation Table develops a plan to provide multi-agency, “wrap-around supports” to the individual or family in question (570). For Sanders and Langan, this program to engage community stakeholders in the definition and management of crime looks cooperative on surface, but ultimately “extends the reach of the police by attempting to ‘responsibilise’ and shape the perspectives and practices of individuals and organisations,” and disperses responsibility for crime such that the police are no longer the primary means of crime prevention or response (Sanders and Langan 2019: 567).

Thus, if the objective is to strengthen community safety in rural Nova Scotia, it must be done without stigmatizing and marginalizing certain groups or activities that are not inherently criminal; without reinforcing an exclusionary, individualistic, nostalgic idea of community; and without downloading responsibilities that exceed community resources. There are lessons to be

found about how to do this, but a strong urban bias in community safety and policy research means that finding such lessons requires sifting through and considering the applicability of theories, empirical evidence, and best practices developed in and for urban areas.

## **2. Urban Bias in Community Safety Policy and Research**

The “community” in scholarship on community safety, including the critiques listed above, is typically urban, and most often the scale is the urban neighbourhood. Thus there is without a doubt an urban bias in crime and community safety research (Ceccato 2015: 157; DeKeseredy 2015: 180; Deller & Deller 2011; Gilling 2007; Owen & Carrington 2015: 231; Panelli et al. 2004; Scorzafave, Justus & Shikida 2015; Wooff 2015: 287).

What “little research” does exist on rural community safety (Gilling 2007:8) tends to test dominant theories that are developed using data from cities in order to see if they hold up in rural areas (e.g., Wilhelmson & Ceccato 2015; Deller & Deller 2011; Donnermeyer 2015). In numerous studies unearthed during this review, the theory in focus was some form of “social disorganisation theory” or its close cousin, “the theory of collective efficacy” (Donnermeyer 2015: 161). Both of these theories “emphasise the intersectionality of such factors as poverty and unemployment, population change or turnover, single parent families, and race/ethnic heterogeneity as breaking down social control within urban neighbourhoods and, by extension, increasing crime” (Donnermeyer 2015: 161). While they have been widely used to explain variation in urban crime rates for over fifty years and are influential in community safety research and practice (Ren, Zhao & He 2019; Vigne 2019), social disorganization and collective efficacy theories are not reliable for explaining crime nor designing community safety initiatives in the “nuanced context” of rural communities (Donnermeyer 2015: 162; *cf.* Deller & Deller 2011).

## Crime Prevention and Community Safety in Rural Communities

Likewise, the “broken windows” theory of crime, which has been highly influential in criminology generally, stipulates that “neglecting incivilities such as graffiti-covered walls, underage smoking, and bad manners will weaken informal control” (Matsukawa & Tatsuki 2018: 91). In other words, if the environment is being neglected, people will lose interest in keeping it safe and feel powerless to do so. Conversely, if an area looks well-maintained and cared for, it probably means that local residents are invested in it, and criminals will be deterred by the impression that people care about and are watching what is going on in their community. This thesis is one of the core assumptions of the “Crime Prevention Through Environmental Design” (CPTED) approach, which seeks to improve the design of physical space to deter crime, by enabling “natural surveillance” and “access control”, that is, gates and fences (Reynald 2011). There is little to no research testing either the broken windows theory nor CPTED principles in rural communities, although some Canadian rural communities have adopted and endorsed CPTED anyway, for example urging their residents to consider crime prevention in their landscaping decisions.<sup>1</sup>

The neglect of rural communities in these dominant theories may seem like an academic problem, but it affects the kinds of crime prevention initiatives designed in rural areas (Lindström 2015: 275), such that the latter “tend to prioritize urban problems’ such as youth crime and drug abuse” (275). In part, rural communities are ignored in scholarship and policy because they are peripheral; they tend not to have universities (Nova Scotia is an exception), and they tend to be governed by provincial or territorial institutions located in cities, with policy developed in cities by urban dwellers. But when it comes to crime scholarship and policy, there is another factor at

---

<sup>1</sup> See, for example, the website of the Alberta Provincial Rural Crime Watch Association: <https://www.ruralcrimewatch.ab.ca/news-events/bulletin-board/crime-prevention-through-environmental-design-cpted>.

play: the “rural idyll” that characterizes rural life as simple, slow, peaceful, and friendly. As Donnermeyer has concluded, “rural was ignored as a location for serious criminological scholarship and in its place a kind of rural idyll (Halfacree 1993) was constructed in which the heterogeneity of the city was contrasted to an assumed homogeneity of the rural” (Donnermeyer 2015: 161). The next section considers the rural idyll and attempts to lay out some general and less controversial, albeit never universal, qualities of rural communities.

### **3. What Is Different about Rural Places?**

The literature in rural studies has been and continues to be preoccupied with defining its object. The “rural idyll” is broadly recognized as misleading or at best a half-truth. “Rural” does not necessarily mean simplistic, tranquil, and cohesive; it is not all rolling hills and coastlines, wide horizons and unspoiled wilderness. The children there do not all run in fields and climb trees; the adults are not all farmers and fishers. The pastimes and tastes are not all “traditional” (Bell 2006: 149). Not everybody knows one another, nor does everyone get along. That is the idyllic version of the rural, and as a social construction of rural life, it has some truth to it, but it is not the whole picture. Rural places can also be complicated and noisy; their landscapes can be industrial, with landfills, mills spewing acrid smoke, and factories on sprawling parking lots. Children’s experiences vary, with many struggling to find a place to be a kid, away from the judgment of adults but without putting themselves in danger. The adult experience varies too, from wealthy retirees to small-town service-sector workers and the seasonally employed. Like any place, rural communities can have tense relations between different people and groups; they have insiders and outsiders, wealth and poverty, and personal rivalries. But if rural cannot be defined in idyllic terms, what is it?

## Crime Prevention and Community Safety in Rural Communities

In rural community safety literature and across rural studies, one definition has gained traction: Halfacree's (2006) "three-fold model [...] based on Lefebvre's understanding of spatiality, where spatial practices, representations of space and spaces of representations combine to form a three-part dialectic where space is perceived, conceived and lived" (Halfacree 2006 in Wooff 2015: 288; *cf.* Mawby 2015; Wilhelmson & Ceccato 2015). In other words, rural can be defined by what it more or less objectively *is*, in terms of how it shapes lived realities and possibilities—more sparsely populated and less built up than cities, often more agrarian, often a considerable distance away from an urban area (i.e., not close enough to be a suburb). In Canada, Bollman (2022) has conceptualized rurality as a function of "density" and "distance to density" that can be quantified and used to measure the remoteness of any place. Density is how populated an area is, in a ratio of people to geographical size; and distance to density is the distance, measured in driving time, between a place and the nearest Census Metropolitan Area. This standardized measurement can produce very good indicators of how far a person might have to travel for healthcare, how long schoolchildren might spend on the bus to school, and how costly a centralized government might believe it is to deliver some public services. Remoteness is thus part of defining rural.

But rural is also defined by how it is perceived; rural is an identity, such that a community that finds itself in quite close proximity to a sprawling city, with access to all of its amenities, possibly even amalgamated into that city, may retain a rural identity in the declarations and self-perceptions of the people who live there. Rurality is also something that is *done*, or *practiced*, governed by tacit norms of behaviour that are often defined explicitly or implicitly in opposition to perceived urban norms. Hence, in a rural community, it might be deemed abnormal to honk a car horn in traffic, and normal to wave hello to everyone on the road and leave doors unlocked. There may also be different social structures in rural communities. Many rural communities "are

high in what is now often referred to in the literature as social capital” (Scott & Hogg 2015: 171)—that is, people know each other, and social networks are strong and enduring. Many rural communities have “big” families that are well-known, well-respected, and active and influential in community and economic life (Owen & Carrington 2015: 234). But even this has an underbelly, insofar as some people are marginalized from the dominant social networks, and even those within the networks can be constrained by them in unpleasant ways. Rural communities have been found to be “predominantly patriarchal and masculine” (Somerville et al. 2015: 222), often because of the centrality of male-dominated industries such as resource extraction. Yet there are examples of rural communities where arts and culture are among the dominant industries—such as Lunenburg, Nova Scotia or Stratford, Ontario—and the gender relations there can be decidedly different.

Thus, rural places have some defining characteristics—they typically are a considerable distance from urban amenities, the people who live there consider them to be rural, and there are certain cultural norms and characteristics that are perceived to be rural—but these are not universal or uncontested. The Canadian Rural Revitalization Foundation has a saying about this: if you have been to one rural community... then you have been to one rural community (CRRF 2015: 2). Nevertheless, pertinent to the issue of rural community safety, one component of the “idyllization of rural life” (Scott & Hogg 2015: 173; Somerville et al. 2015: 221) is the assumption that rural places are safe and friendly. But “rural areas can be frightening” too (Panelli et al. 2004: 448), and they are by no means free of danger or crime.

#### **4. What Is Different about Rural Crime and Victimization?**

As mentioned above, much of the work in rural crime research attempts to test whether urban theories apply in rural areas the same way. But it is not just that the dominant theories do not fit;

## Crime Prevention and Community Safety in Rural Communities

there are also blind spots in understandings of what kinds of crime matter in rural communities. There are offences that are highly relevant in rural places but not in urban, such as environmental crime on farms, and these are underexamined (but *cf.* Barclay and Bartel 2015). There are different dominant crimes in different communities—for example, in a study of policing in small communities in Oklahoma, Shukla et al. (2019) were informed that much of the property crime is actually linked to drugs (207). Additionally, there are kinds of crime that would seem *unlikely* in rural areas but are actually common. As DeKeseredy (2015) has noted, “a sizeable portion of corporate/white collar crimes, such as the dumping of toxic waste and the exploitation and victimization of farm labor [...] occur in rural communities” (184). Likewise, Somerville et al. (2015) has found plenty of evidence of niche illegal and illicit activities, including “cattle and sheep rustling, tax evasion, [and] EU subsidy fraud...” (223).

Canadian statistics point to some definite rural-urban differences at the aggregate level. For instance, rural residents are actually more likely to experience crime when rates are compared to urban on a per capita basis (Perreault 2019). And certain kinds of crimes are more common in rural areas: the rates of physical assaults, firearms offences, sexual assaults, and sexual violations against children, for example, are higher in rural areas in Canada (Perreault 2019). But the aggregate view obscures some important provincial variation. When the statistics are broken down by province, it becomes clear that rural crime rates are only higher than urban in Newfoundland and Labrador, Manitoba, Saskatchewan and Alberta (Perreault 2019). The rates of specific types of crime in rural communities also vary widely depending on the province.<sup>2</sup> Moreover, when rural communities are compared to each other, there is significant variation in crime rates (whereas urban crime rates are less variable) (Perreault 2019).

<sup>2</sup> See the following table for provincial rates of specific criminal code violations in rural areas: <https://www150.statcan.gc.ca/n1/pub/85-002-x/2019001/article/00009/tbl/tbl05-eng.htm>

## Crime Prevention and Community Safety in Rural Communities

Thus, it is difficult to pin down exactly what characterizes rural crime in a universal way.

As Somerville et al. (2015) have explained,

It is not just that the various versions of the rural idyll conspire to distort people's perceptions of rural crime; it is also that the different interpretations of rurality imply different understandings of rural crime. In particular, the concept of a "differentiated countryside" (Murdoch et al., 2003) suggests that the types of crime committed may vary and may be viewed differently from one rural area to another. It also suggests that rural crime, like rurality, is to be understood in terms of the localities in which it occurs, how it is socially represented, and the everyday circumstances in which it is committed, experienced and interpreted (221).

Overall, interest in rural crime and in understanding its causes is warranted. A considerable amount of crime happens in rural communities, including violent crime. However, the oft cited statistic showing that the rural crime rate is higher than the urban rate in Canada (Griffiths 2019: 247; Mawby 2015: 262), upon closer reading, is driven by a few outliers. As Statistics Canada's report on rural crime makes clear, "the higher crime rate in rural areas was driven by a small number of police services that reported very high crime rates. In fact, most police services serving a predominantly rural population recorded relatively low rates of crime" (Perreault 2019: 3).

Still, no matter how low the aggregate crime rate is in rural communities, it matters. And efforts to understand, prevent, and respond to it will not be well served by transplanting theories and initiatives developed in, by, and for urban communities. The research that exists on rural crime suggests that what it is, how, when, and where it happens, whether or how it is reported, and how it is dealt with, are all strongly shaped by two characteristics of rural communities, and each has the potential to enable crime as well as to constrain it. These two characteristics are isolation (that is, the distance between homes, as well as the distance between communities and rural and urban areas) and social cohesion (that is, the strength and types of ties between people in the community).

## Crime Prevention and Community Safety in Rural Communities

*A. Isolation*

Two of the least controversial characteristics that define rural places are the lower population density—which means that households are more spaced out—and the longer distances from more populous areas. These two characteristics are forms of isolation: people in rural communities are more physically isolated from one another, and communities themselves are more physically isolated from other communities.

In rural community safety literature, both of these forms of isolation have been found to have the potential to be protective *and/or* endangering. According to Ceccato (2015), “geographical and social isolation are part of the dynamic of crime in rural areas,” insofar as they make crime detection difficult (158). Isolation can also affect the reporting of crime: Panelli et al., in their study of domestic violence in Australia, have written that “physical isolation has been associated with a number of different factors including distance from local centres, poor roads and seasonal conditions (Alder 1996)”, and “some studies of domestic violence have noted that these attributes can also result in social isolation (Fletcher & Lunn 1996),” making people less likely to report domestic violence (Panelli et al. 2004: 448). Statistics on crime in Canada support this hypothesis; self-reported victimization is lower in rural Canada compared to urban (Perreault 2019). But at the same time, “some authors have noted what we call the ‘insulating effect’ of distance that can result in feelings of safety...” (Panelli et al. 2004: 448). Lower population density also makes crimes of convenience more difficult to pull off; things like burglaries or theft might require more coordination. The efficiency of straightforward theft—from unlocked cars or homes, or from pockets—is lowered when there are fewer of those targets around.

However, when it comes to accessing services after a crime has happened, there is little doubt that isolation makes things more difficult. In communities where there is limited local law enforcement, there is a greater potential for “vigilantism or at least banishment [of criminals] as a

solution to crime that locals might find reassuring” (Panelli et al. 2004: 462). Looking at domestic violence, Owen & Carrington (2015) have also described the “tyranny of distance”—a common concept across rural studies—which results in “victims of DV [...encountering] considerable difficulty in accessing appropriate services, as this and other studies have found” (235).

### *B. Social Cohesion*

As mentioned earlier, rural communities have generally been found to be more cohesive than cities and higher in social capital (the enduring, generative, and often beneficial bonds between people), and in this way, they reflect some of the assumptions entailed in the rural idyll.

Accordingly,

much of what has passed as rural criminology has been content to look at these networks in terms of their social control effects, the idea being that tighter social integration in rural places helps to prevent crime. Indeed, for a very long time it could be said that insofar as criminology focused on rural crime at all it was not to explain crime in rural settings, but rather to offer rural social order as an explanation for the relative absence of crime (Scott & Hogg 2015: 171).

But many scholars studying rural crime have pointed out that, like isolation, social cohesion—“the so-called ‘cohesive community values’ [that] strengthen rural communities”—“may also have the unintended effect of ‘enabling’ crime” (Ceccato 2015: 159; *cf.* Somerville et al. 2015). For example, in rural communities where everybody seems to know everybody else, residents have been found “to keep community problems to themselves by viewing crime as a personal matter and not seek the help of law enforcement agencies” (Deller & Deller 2011: np). The constraining effect of social cohesion is especially concerning in cases of domestic violence. In interviews with rural domestic violence service providers, Owen and Carrington (2015) have found that “the impact of personal shame and embarrassment was a constant theme” (233), as the “stigma” of domestic violence in small, tight-knit communities deterred women from reporting abuse. The authors concurred with previous research that “in small towns with high levels of

## Crime Prevention and Community Safety in Rural Communities

mutual recognition and active local gossip networks, shame and embarrassment can act as major deterrents to reporting violent crimes” (Owen & Carrington 2015: 233). In rural Australia, research suggests “the cultural importance of family and the conservative and traditional beliefs” are a more specific manifestation of social cohesion that “ensure that women experiencing violence have great difficulty reporting abuse” (Alston 1997: 16, cited in Panelli et al. 2004: 448).

The everyone-knows-everyone character of many rural communities also affects police. As Griffiths (2019) has found in northern Canada, “police officers in rural communities face challenges in insulating their family and private lives from the scrutiny of community residents, always being on duty, and in meeting community expectations that officers will be closely integrated into community life and activities” (248; *cf.* Shukla et al 2019).

### *C. Gender*

Crime and safety are always gendered (Kruttschnitt 2013), and rural crime is no exception. However, the research in urban areas (e.g., the gender and public safety research of Angeles & Robertson 2020) is difficult to extend to rural communities. Much of the research on rural crime that deals explicitly with gender is focused on domestic violence. And all of it, taken together, “demonstrates that rural women are at higher risk of experiencing intimate male intimate violence than those in more densely populated areas. The key risk factors identified include [...] isolation, male peer support, [and the] “ol’ boys network”), but our knowledge about private violence in the lives of rural women is incomplete” (DeKeseredy 2015: 182).

Owen and Carrington (2015) have explained that rural women face additional, or at least different, barriers to leaving violent relationships and seeking support compared to women living in cities, as they are

## Crime Prevention and Community Safety in Rural Communities

faced with making a calculated risk of reaching out to limited services to deal with the abuse and increase their likelihood of losing personal resources and supports in the process. If they want to leave or end violent relationships, for many in rural areas, this means having to face the tyranny of distance [...] and travel long distances to seek DV services [...]. Rural women who leave abusive relationships face the prospect of only being able to access limited support services (Owen and Carrington 2015: 235).

Women with very limited resources (for example, women who do not have access to a car) are even more disadvantaged in this situation (unable to drive to access services but also unable to view apartments to rent). In communities with few formal amenities and tight bonds, as one of Owen and Carrington's research interviewees explained, "there's a whole economy of favours," and women who draw on their friends and family to help them out of domestic violence situations risk using up all their favours and having their private lives exposed to the entire community (Owen & Carrington 2015: 235).

More women than imagined may also be affected by limited resources. Owen and Carrington have found that many "farm women" did not qualify for low-income targeted support because on paper their families appeared to have money. But they personally could not access it (Owen & Carrington 2015: 236). Thus, many women in their study site were "unable to access personal resources or access formal public services as a result of not meeting the income test criteria" (237).

The gendering of rural crime is pertinent largely but not only to domestic violence. In the United States, DesKeseredy (2015) has found that "gender plays a key role in the development of rural hate groups, which consist primarily of 'emasculated white men,'" and "a disproportionate share of all hate groups [are] located in rural areas" (184). Very little research exists that explores gender, rurality and crime beyond a binary view of gender or with reference to sexuality, although calls for such research have been made (Dwyer et al. 2015).

## Crime Prevention and Community Safety in Rural Communities

*D. Insider/Outsider Relations*

The characterization of rural communities as peaceful by default glosses over many dangers, including the increased risk of domestic violence facing rural women. It also combines with tighter social bonds to feed into a perception that when rural crime *does* happen, it is because some outsider has infiltrated a community's boundaries (Halfacree 1996). Both Panelli et al. (2004) and Somerville et al. (2015) have noted that "it is easier (and safer) for residents of small rural communities to erroneously attribute crime to outsiders than accuse neighbours within the confines of small groups" (Somerville et al. 2015: 222). The result is "narrow and exclusionist" "constructions of rural community" (Panelli et al. 2004: 464).

Rural residents are not solely responsible for perpetuating this myth. Scott and Hogg (2015) have noted that "rural media, for example, do much to highlight difference, diversity and fragmentation as problematic features of the lived countryside, especially when focused on crime problems" (173). Moreover:

An American study of urban press reporting of crimes in small towns has shown how such accounts often serve to confirm the image of them as places where bad things do not happen even as the reports might seem to suggest the opposite. They do so by constructing a sense of dissonance between the place and the bad event occurring within it (Scott & Hogg 2015: 173).

When crime and danger are associated with outsiders, anyone who looks different from the norm is subject to being "register[ed] as a disturbance of the rural, a discordant presence" (Scott & Hogg 2015: 173; see also Yanay 1994). Mols & Pridmore (2019) have found, for example, that neighbourhood watch groups tend to become suspicious of anyone who looks different, even when no crime has happened. While their research is urban, it is reasonable to assume that the insider/outsider dynamic in perceptions of rural crime is problematic because it likely hinders efforts to address the real sources of crime, and it also undoubtedly serves to make rural places more dangerous for marginalized groups within them (cf. Loftus 2009).

*E. Policing*

Isolation and social cohesion in rural communities also shapes policing in interesting ways. In a scan of the literature, Wooff (2015) has pointed out that extant studies find that officers in rural areas have to work to build respect and trust while they also enforce the law. Previous research also found a greater use of “discretion” in policing (290), an emphasis on “crime prevention over enforcement,” and “a wider range of tasks” among rural officers compared to “their urban based colleagues” (Wooff 2015: 291; cf. Shukla et al., 2019). Wooff’s research has also found that rural policing is highly context dependent, with discretion woven into the unique fabric of each community (Wooff 2015). Several studies have noted the higher visibility of police in rural communities: they stick out and are more easily scrutinized by their communities, and officers often feel as if they have no private life (Shukla et al. 2019; Griffiths 2019).

There is mixed evidence around the issue of trust in police in rural communities. As mentioned earlier, rural residents might be less likely to report certain kinds of crime because they worry about the effect it would have on community relations. However, the evidence to support this hypothesis is mixed. There is plenty of qualitative evidence (e.g., Owen & Carrington 2015) showing that women are less likely to report domestic violence in rural areas. But Kaylen and Pridemore (2015) have found that police notification and emergency medical treatment following *violent* victimization are no lower in rural areas compared to urban or suburban. Lindstrom (2015) has noted that trust in police is found to be higher in rural communities, but even this is inconsistent (275). At the same time, Griffiths (2019) has pointed to previous studies that show that rural communities “populated by large numbers of Indigenous persons whose contact with the police historically and in contemporary times may have resulted in suspicion and distrust of the police, with a corresponding lack of confidence in, and legitimacy of, the police” (248). In Canada, studies have shown that rural households are *more* likely to

## Crime Prevention and Community Safety in Rural Communities

report property crimes than urban, but about as likely to report violent crimes (Perreault, 2019: 9). Regardless of the ambiguous findings on levels of reporting and trust in police, it remains true that police are part of any crime prevention strategy, and rural policing is highly context dependent, involves more officer discretion, and benefits from officers who know and live in the area (although the close ties between officers and population do present some unique risks, detailed further below). As Griffiths (2019) has argued on the basis of his own research and that of others, “effective crime prevention programs require relationships between the police and the community based on public confidence in, and the legitimacy of, the police” (252).

**5. What Do Safe Rural Communities Look Like?**

As the previous sections have emphasized in different ways, there is no simple binary of “safe” versus “unsafe” community characteristics. Some of the community attributes that work to prevent crime can also work to conceal or perpetuate crime (Panelli et. al. 2004: 454). Moreover, there is insufficient research to test whether lessons from “safe” urban locales can be transferred to rural ones.

This is true of “collective efficacy” (Deller & Deller 2011; Donnermeyer 2015: 161)—that is, the willingness and ability of residents to engage in crime prevention and their belief that their actions can make a difference. As noted earlier, the theory of collective efficacy holds that communities where residents feel empowered to control crime are safer because of it (Ren et al. 2019; Vigne 2019). This theory has been tested extensively in cities, but there is less empirical research on how it works in rural communities. As a closely related concept to social cohesion, in rural areas collective efficacy has been theorised to enable or conceal certain kinds of crime as much as it prevents other kinds (Donnermeyer 2015: 161). The flipside of high collective efficacy, “social disorganization,” is the theory that low rates of “residential mobility, cultural

## Crime Prevention and Community Safety in Rural Communities

heterogeneity, family instability, etc.” are correlated with lower rates of crime (Donnermeyer 2015: 174). This mostly holds true in urban research, but again, rural studies show that in some cases, low social disorganization—low residential turnover, homogeneous populations, and strong influential families—can work to hide and facilitate crime. Domestic violence, as mentioned above, is a good example of the type of crime that a static, patriarchal, homogeneous community may collectively ignore (Panelli et al. 2004; Owen & Carrington 2015). While these findings are contradictory and confusing, it is nevertheless a reasonable assumption that safe rural communities will be those that channel the strong social ties among their relatively stable populations toward crime prevention and support for victims. Communities that treat victims’ safety as more important than community interpersonal relations and residents’ reputations are inherently safer (Panelli et al. 2004: 450). More research and experimentation with community safety initiatives is needed to determine how this can be achieved.

Less controversial or uncertain is the role of social inequality in shaping community safety. While the precise relationship between inequality, poverty, and crime is not fully understood, it is generally accepted that communities with lower levels of poverty and social inequality are safer (Donnermeyer 2015; Gilling 2001; Pease 2001; *cf.* Crawford 1999: 152). Safe communities tend to be those that work against social, economic, and political marginalization and toward inclusion of all people in these aspects of community life.

The wider literature on crime prevention also emphasizes the importance of social capital, which entails networks, generalized trust, and shared norms within a society. Higher social capital is linked to lower crime rates, but inconsistently—that is, some aspects of social capital seem to matter, while others do not. Moreover, the causal direction is unclear—that is, we do not know whether higher crime rates diminish social capital or vice versa (Buonanno et al. 2009). The evidence to support the social-capital–crime link in rural communities is limited (Scott &

## Crime Prevention and Community Safety in Rural Communities

Hogg 2015), and like social cohesion, social capital seems to work in two directions—to conceal and facilitate crime as much as it prevents it. However, the trust that people have in each other, in law enforcement (Griffiths 2019), and in institutions such as schools, courts, and government, is a reasonable place to look for ways to strengthen community safety. Communities where trust among diverse groups of residents *and* between residents and institutions is high are likely safer, but care must be taken to mitigate the crime-facilitating potential of social capital.

### **6. How Does Rural Nova Scotia Compare?**

In Nova Scotia, where 43% of the population lives in rural areas, the rural crime rate is just slightly higher than the urban (Perreault 2019). Interestingly, this is “mainly the result of a high number of frauds” (Perreault 2019), but the rates of other kinds of crime are still high enough to put to rest the notion that rural is inherently peaceful and safe.

Rural Nova Scotia is a good example of how “rural” is not a homogeneous category. Its population is older and ageing and has a higher rate of disability than its cities (NS Accessibility Directorate 2020). Like many rural communities, the province’s rural areas are generally less diverse than its cities, but recent survey research has shown that rural Nova Scotians are not much less open to immigration than their urban counterparts (McLay & Ramos 2021). But immigration is not the main source of the province’s racial, ethnic, or cultural diversity. Nova Scotia is unique in Canada in that it has a rural Black population—African Nova Scotians—who have lived throughout the province since the 1800s and call several rural communities home. There is limited research on the experience of rural African Nova Scotians, but what does exist points to the importance of the intersection of race and rurality. Historically, African Nova Scotians were settled on “land in impossible-to-farm districts, which were practically reserves, from which [they] filed mornings to work as cheap labour in white homes and in white-controlled

## Crime Prevention and Community Safety in Rural Communities

cities and towns,” in the words of African Nova Scotian poet, George Elliot Clarke (2012). Their marginalization, economically, politically, and socially, continues today, although their culture is strong and proudly protected, and the global *Black Lives Matter* movement has brought new awareness to police practices such as “street checks”, which are disproportionately used on Black people in Nova Scotia (Wortley 2019). One Master’s thesis project carried out at Acadia University in 2017 found that African Nova Scotians living in Digby, a small coastal town and surrounding rural area in the province’s Valley region, experienced everyday, widespread racism they considered to be more characteristic of the “50s” than the present day (Bundy 2017: 83). This experience extended to interactions with police and the justice system, whether interviewees and their friends and family were the victims of crimes not being taken seriously or the target of unsubstantiated accusations motivated by racism. The researcher concluded that “African Nova Scotians in Digby are believed to be seen as the dangerous ‘other’ and are associated with crime” (Bundy 2017: 88). Her research also showed how gender intersected with race and rurality to shape the experiences of rural African Nova Scotian women with regard to the police (Bundy 2019). Bundy’s research participants in these studies felt targeted, not protected, by the police and did not trust them, just as they felt ostracized by the rest of the community in Digby.

Rural Nova Scotia is also the ancestral and current home of several First Nations and Indigenous peoples, who are marginalized in everyday life and particularly in the justice system, in similar but distinct ways compared to African Nova Scotians. Recently, tensions have flared over Indigenous peoples’ exercise of “moderate livelihood” fishing rights in rural Nova Scotia, with non-Indigenous fishers allegedly setting fire to the storehouses of Indigenous fishers (Hogan 2020). Interestingly, the rights in question can be traced back to a Supreme Court decision involving Donald Marshall Jr., who caught and sold fish without a license but fought the resulting charges in what became “a six-year legal battle over First Nations treaty rights” (Butts

## Crime Prevention and Community Safety in Rural Communities

2020). Decades before the case, Marshall had also been wrongly accused of and imprisoned for a murder he did not commit. His eventual acquittal triggered a Royal Commission into racism in the criminal justice system. While that Commission focused on Marshall's wrongful conviction, the murder victim was an African Nova Scotian named Sandy Seale. The murder itself and the lack of serious effort to identify, arrest, and prosecute the actual murderers (who were white) has been attributed to anti-Black racism as well (Metallic 2019). Thus, there is ample historical and contemporary evidence that racism affects community safety in rural Nova Scotia, such that African Nova Scotians and Indigenous people are often marginalized in social and economic life and targeted by punitive and crime prevention initiatives. Although tense and distrustful relationships within communities and between communities and police can exist anywhere, in rural Nova Scotia it is important to attend to the ways in which such relationships are shaped by racism and colonialism.

When asked what they love about their communities, rural residents of Nova Scotia have emphasized safety, quiet, and nature (more so than their urban counterparts) (Foster et al. 2020). They are less likely than urban Nova Scotians to say they like being close to good jobs and amenities (Foster et al. 2020). Indeed, there are fewer amenities in rural Nova Scotia, but none of the province's communities are extremely remote. A 2019 survey of Nova Scotians asked respondents to indicate if their community had, within it or within a very short drive, the following amenities: emergency room, doctor's clinic, bank, college or university, full-sized grocery store, convenience store, gas station, library, recreation facility (pool, skating rink, gym), pharmacy, fast food restaurant(s), sit-down restaurant(s), and pub(s) or bar(s) where alcohol is served. 92–98% of respondents said they had each of these amenities close by, with two exceptions: only 72% said they had a college or university in or very near their community, and 88% said they had an emergency room (Foster et al. 2020). Importantly, however, the presence of

## Crime Prevention and Community Safety in Rural Communities

an amenity within driving distance does not necessarily connote access; across rural Nova Scotia, one of the primary concerns is access to healthcare, including primary care, emergency rooms, and specialists (Foster et al. 2020).

Unlike the sites of most rural crime case studies examined here, Nova Scotia's rural areas are not dominated by farming. In fact, many of the province's rural areas are fishing communities. Fishing operations are qualitatively different than farms: the structure of the workforce, how families work together, the money involved, and, importantly for this report, the way vessels and fleets can be networked into global trade routes that can be used for smuggling illicit drugs (Pottie 2021). While there are works of investigative journalism (e.g., Silver Donald Cameron's *Blood in the Water*) and fiction (Frank Parker Day's *Rockbound*) that deal with the darker underbelly of fishing in Nova Scotia, no academic research was unearthed in these searches, even with more targeted keywords.

Where farming is heavily concentrated, the rural crime literature assembled here may be more applicable, but even that literature has little to say about some of the relevant structural features of farming in Nova Scotia: for example, the highly seasonal character of the work due to relatively short growing seasons, or the considerable reliance on temporary foreign workers to cultivate and process farm products (Horgan & Liinamaa 2017). The connections drawn between rural perceptions of and reactions to crime, and the insider-outsider dynamics, most certainly has relevance in communities where temporary workers come and go. Moreover, agriculture's increasing reliance on precarious forms of labour and citizenship (Weiler et al. 2016) might shape community experiences of crime and safety, but this is not addressed in the existing literature on rural crime or literature on farm labour.

Yet despite the best efforts of some tourism campaigns, not all of Nova Scotia's rural areas are organized around fishing or farming. Some of the province's rural and small-town

## Crime Prevention and Community Safety in Rural Communities

communities have strong manufacturing sectors (e.g., Michelin in Bridgewater), while others are driven by farming (e.g., the Annapolis Valley). Some rural communities are growing (e.g., Hants and Colchester County), and others, like Cumberland County, are shrinking (NS Finance and Treasury Board 2022). Since 2020, the province experienced record in-migration, with many new residents settling in rural areas. Across the entire province, house prices have increased dramatically, with out-of-province buyers cashing in on more expensive markets elsewhere and paying cash for less expensive homes in Nova Scotia (Foster et al. 2021). Not every buyer actually moves into their new home; short-term rentals, such as Airbnbs, are growing at a higher rate in rural and small-town communities across Canada, taking homes off the market and dramatically shrinking the stock of long-term rental options (Combs et al. 2020). In some rural communities, the result of high in-migration and short-term rentals is a housing crisis (Foster et al. 2021).

Turning to crime prevention, Nova Scotia has nine small-town municipal police agencies and over forty RCMP detachments outside the Halifax Regional Municipality. It does not have an overarching crime prevention strategy or plan. This dispersed and ad hoc crime prevention approach can be situated in the context of a larger federal government reallocation of resources toward the “local or municipal level” for the “creation of crime prevention and community safety councils” since around the 1990s (Leonard et al. 2005: 234). Specifically:

In 1994, the government of Canada established the National Strategy on Community Safety and Crime Prevention. [...] The broader vision was to encourage federal, provincial, and territorial cooperation and emphasize the mobilization of citizens to take action at the local level to work toward safer communities (Leonard et al. 2005: 234).

One component of this initiative is the “Crime Prevention Investment Fund” (CPIF) fund, which supports crime prevention pilot projects and evaluates them.

## Crime Prevention and Community Safety in Rural Communities

At least one CPIF-funded project took place in Nova Scotia: a Restorative Justice project with 6000 participants. It appears to have been successful, with 78% of participants not reoffending 26 months after the program’s end, compared to only 49% of nonparticipants (Leonard et al. 2005: 239). But like most of these short-term, grant-dependent projects, it ended. Other rural studies scholars have pointed out that the social and economic development of small communities is stymied and exhausted by the endless cycle of grant applications and reporting that are characteristic of the “proposal economy”: “a system that empowers [communities] to imagine, engage, and propose but not to count on the state to provide certain services” (Stern & Hall 2015: np). In the proposal economy, “proposal-making and applying for grants have become normalized activities,” and small communities and the civic groups and institutions within them have become accustomed to short funding cycles of several years or less, in which they must create, implement, operate, and evaluate programs and projects to solve pressing community problems, only to run out of funding and begin the process over again. This is arguably what has happened in Nova Scotia’s bottom-up community safety activities: over the last thirty years, the province has, like other Canadian provinces, run numerous “crime prevention strategies with a focus on community and social development” (Leonard et al. 2005: 233), but a look at the provincial government’s website reveals that most are now stale—deadlines and announcements associated with most (if not all) are from years ago.<sup>3</sup>

Outside the initiatives funded by the CPIF and formed under the National Crime Prevention Strategy, it is worth noting that Nova Scotia has a “Diversity and Community Capacity Fund” that aims to support community-led “capacity-building efforts of organizations

---

<sup>3</sup> See the Nova Scotia Crime Prevention webpage: <https://novascotia.ca/just/Prevention/>.

## Crime Prevention and Community Safety in Rural Communities

that represent traditionally marginalized communities and promote diversity and social equity.”<sup>4</sup>

While not explicitly a crime prevention initiative, the Diversity and Community Capacity Fund targets the social capital attributes that have generally been found, albeit inconsistently, to improve community safety. Without doubt, more could be done to improve rural community safety in Nova Scotia and across Canada.

Indeed, a more recent 2019 parliamentary report shone a spotlight on rural crime in Canada. In response to criticism from opposition parties, the Liberal government ordered the Standing Committee on Public Safety and National Security to conduct a study of rural crime in Canada. In 2019, the committee released a brief report that found that long police response times were “the core of the crime problem in rural areas [...] causing an erosion of public confidence” (Standing Committee 2019: 2). It recommended that the provinces and territories “increase investments in policing and innovative solutions, including emergency response and dispatch centres” and that “the RCMP should consider ways to partner with other policing agencies and make greater use of the auxiliary and reserve programs in rural areas” (3). Overall, the Committee argued that “effective crime reduction measures should have at least four components: adequate police resources, partnerships with the community, robust victim support and a justice system that inspires public confidence” (3).

When it was presented in Parliament, the opposition parties critiqued the brevity of the report and its contents. They pointed out several important issues that it ignored. First, rural Opposition Members of Parliament noted that the RCMP sends new recruits to rural areas, and many of them do not know the local contexts (Standing Committee 2019: 11). Relatedly, they

---

<sup>4</sup> See the Nova Scotia Communities, Culture, Tourism and Heritage webpage: <https://cch.novascotia.ca/investing-in-our-future/diversity-and-community-capacity-fund>.

observed that there are not enough Indigenous RCMP officers or cultural awareness among officers. They raised the issue of rural suicide and urged for more investment in rural suicide prevention and mental health services. Echoing the focus of the international literature examined here, they underscored the need for domestic violence prevention and support for victims. Many said their communities had reduced 911 service (Standing Committee 2019: 11–15).

## 7. What Works?

A search for clear examples of effective community-level safety initiatives is fraught with the same problem that makes such initiatives difficult to carry out: a lack of long-term investment resulting in a lack of long-term programs with evaluations showing their efficacy. Nevertheless, robust synthesis of empirical research on community safety has underscored the same basic principles again and again. For instance, Griffiths (2019) and Leonard et al. (2005), both writing in Canada, converged on similar factors known to be important in crime prevention.

### *A. Collaborative Approaches: Potential and Pitfalls*

The first of several “attributes of an effective crime prevention model” is “ongoing collaboration and communication with the community and with specific groups within the community” (Griffiths 2019: 247). As Leonard et al. (2005) have detailed, this involves “broad-based” engagement with a “cross-section of the community” (235) represented by “multiple partners” and “various groups” in all aspects of community safety, from a “comprehensive needs assessment,” which might itself help in “raising awareness in the community about the issues and the need for collective action” to “recruiting workers or volunteers from the community” to carry out safety initiatives (243). This insistence on community partnerships and bottom-up definitions of priorities and appropriate and effective responses reflects the new “norm” (Harkin 2018: 125) in community safety (*cf.* Gilling et al. 2013). Indeed, as Leonard et al. (2005) have found,

## Crime Prevention and Community Safety in Rural Communities

“experiences in many countries illustrate the mainstreaming of local governance and partnership in crime prevention and community safety” (235).

Yet researchers have also pointed out that the insistence on community involvement is “premised on research studies largely conducted in urban centers where police and community resources can be mobilized. Less is known about the challenges and opportunities for crime prevention in sparsely populated rural and northern communities” (Leonard et al. 2005: 247; *cf.* Choi & Lee 2016). Moreover, the literature abounds with cautionary tales and critiques of community engagement. Gilling et al. (2013) have noted that the “local” in local community is in practice a negotiated term among different stakeholders and may be a point of tension in deciding who is to be involved and consulted in planning and carrying out community safety initiatives (336). Additionally, recalling the earlier discussion of the double edge of social cohesion, many studies in this scoping review found that communities construct crime and differentiation in ways that sometimes marginalize certain groups or activities, or are based on discrimination (Panelli et al. 2004: 457). Many rural communities have an “establishment” group—people who have been there longer and wield more social, economic, and political power. These “established groups not only treat others as inferior, but also make them feel inferior, which can have a paralyzing effect on groups with less power and cohesion” (Scott & Hogg 2015: 176). In Scott and Hogg’s research site in Australia, for example, Indigenous peoples have been “repeatedly characterized as a discordant presence” (177). Other studies referenced by the authors found that “concern about crime may actually be concern about unwanted social change—a threat to ‘how the place used to be’, and thus a further confirmation of an idealized rural” (Scott & Hogg 2015: 175). Through the act of “claim-making,” particularly by dominant groups in communities, “some activities are highlighted as socially problematic in rural places and others are ignored. This, in

turn, influences the allocation of crime control resources and, notably, impacts upon how police do their work” (Scott & Hogg 2015: 175).

While there is scant research on such processes of defining crime in Nova Scotia, the link between how crimes and social problems are defined and the marginalization of particular groups is, without a doubt, relevant to the local context. Indeed, the CPIF is still active, and it is worth noting that many of the projects across Canada are child-focused, early intervention approaches that work on teaching pro-social behaviours and conflict resolution to children and their families (Leonard et al. 2005: 239–40). The same focus is found in Finland (Savolainen 2005: 176)—that “the most common variant [of community crime intervention] entails efforts to reduce crime and violence among juveniles; typically by addressing risk behaviors (e.g., drinking and drug use) and/or risk groups, such as children of immigrants. More than one third of the local projects that have received government funding [in Finland] belong to this general category” (176). While there is a good scientific reason to target youth in crime prevention activities, it also has the unintended consequence of linking youth with crime in general, and with casting suspicion on what are usually innocent pastimes—loitering or skateboarding, for example. In rural communities where there may be few structured opportunities for teenagers to socialize, hanging around in groups is a usually harmless activity that is often punished or prevented, pushing young people out of community spaces and into more risky situations (Foster & Main 2018: 39–41). The example of youth highlights the importance of listening to communities about what is troubling them, criminally, while also remaining cognizant of how the social construction of crime can go hand in hand with xenophobia and the marginalization of certain groups (Scott & Hogg 2015: 175; *cf.* Mols & Pridmore 2019; Super 2016).

In any case, Harkin (2018) has argued that not all problems are possible to address collaboratively. “Crimes with serious, violent implications” such as the “punishment beatings” he

## Crime Prevention and Community Safety in Rural Communities

asked respondents about, “are probably less amenable to community approaches” (see **Figure 1**), and residents in Harkin’s study were less willing to be involved in such matters anyway, sending “the clear message [that] there are certain safety issues which are strictly the ‘job of the police’” (Harkin 2018: 130). Accordingly, extant research points to the importance of “the integration of crime prevention initiatives at all levels of the police organization; (4) the support of patrol and investigative unit officers; [and] (5) crime prevention as a core component of police organizational and operational performance” (Griffiths 2019: 247).

*Figure 1: Collaboration within Community Safety Partnerships, as Studied by Harkin (2018: 134)*

*B. Research, Evaluation and Sustainability: A Challenge for Community Capacity*

Even if a community succeeds in mobilizing residents and law enforcement around a safety initiative or around an overarching community safety plan, the community faces the additional problem of keeping that momentum going. This is particularly challenging given some of the other best practices put forward by community safety literature. Griffiths (2019) has found that that any crime prevention and community safety initiative should be “evidence-based and best practice-informed,” should employ “performance metrics to assess the impact and outcomes,” and, importantly in light of the above discussion about short funding cycles, needs to be sustainable (247). Leonard et al. (2005) have further emphasized the critical need for program evaluation to identify what works and to help direct limited resources to the most promising actions. But such best practices—conducting research and evaluations, ensuring long-term

## Crime Prevention and Community Safety in Rural Communities

program sustainability, etc.—are stymied by what is fashionably referred to as “community capacity.” As Leonard (2005: 244) has asserted, the only way for a national strategy to “support research-based community action” is to “build community capacity,” which can be “hardest in the high-crime areas where it is most needed” but they “have the most to gain” (246).

Interest in community capacity has grown dramatically since the late 1990s, and in that time some important critiques have surfaced as well. The term has generally been used to refer to a collection of attributes and resources akin to social capital: capacity is theorized as a bundle of community relationships, skills, and political engagement, and communities are presumed to need healthy amounts of these traits to be able to help plan, operate, and support community safety initiatives. According to Craig (2007), this term is now used around the world in social and community development, but echoing the critiques of responsabilization outlined earlier, he has argued:

Its widespread use represents a continuing failure of governments properly to engage in “bottom-up” development, is built on a “deficit” model of communities which fails to engage properly with their own skills, knowledge and interests, and helps to obscure structural reasons for poverty and inequality (Craig 2007: abstract).

He has also noted that community capacity is difficult to operationalize and in practice can be indistinguishable from earlier community development frameworks and practices. However, there are positive models of community capacity that lay out the activities and initiatives that build capacity, as well as the indicators that show where capacity is actively being built. The Aspen Institute, for example, has developed an approach to measuring and increasing community capacity that is available for any community group to use (Aspen Institute 2009). Importantly, their metrics move beyond the narrowly economic.

### *C. Inclusive Social and Economic Development*

Where earlier “environmental criminology” theories “tended to focus on the physical aspects of environment,” newer theories and resulting practices have focused on “connections among

## Crime Prevention and Community Safety in Rural Communities

individuals—social networks and the norms of reciprocity and trustworthiness that arise from them” (Matsukawa & Tatsuki 2018: 91–92). These aspects of community life have in some cases completely displaced more tangible economic indicators in actual crime prevention activities. As Matsukawa and Tatsuki (2018) have summarized:

Other similar studies have concluded that social capital has a significant effect on homicide rates with no effect from variables such as unemployment rate or population age composition (Rosenfeld et al., 2001), that cohesion and shared expectations of the wider community lower the rate of crime and disorder (Sampson et al., 1997), and that strong community networks reduce the potential for violent crime by helping young people to acquire a sense of status and self-esteem (Kawachi et al. 1999) (Matsukawa & Tatsuki 2018: 92).

Similarly, other research has found that “organizations that foster collective efficacy and social cohesion can contribute to decreased levels of crime (Wo 2014)” independently (Vigne 2019: 255). Additionally, rural criminology has demonstrated that the impact of social factors on crime—and specifically the presence of “personal, face-to-face, stable interaction around a familiar and shared set of norms”—is *greater* in rural areas. That is, social factors have greater explanatory power in making sense of crime in rural communities, compared to urban areas, where economic indicators are better predictors of crime (Donnermeyer et al. 2006: 206).

However, the weaker power of economic indicators in explaining rural crime does not mean they do not matter, just that the relationship between economics and crime in rural communities is complex and not fully understood. As Donnermeyer et al. (2006) have made clear, poverty is one of the most important factors shaping social cohesion and collective efficacy in any given community. Yet it can work in different, counterintuitive ways, such that high poverty rates, especially in communities with high inequality, might correlate with higher crime *or* poverty. On the other hand, widespread poverty in a single community might help draw people together around shared goals and values, thereby reducing crime (Donnermeyer et al. 2006:

## Crime Prevention and Community Safety in Rural Communities

208). Nevertheless, the limited evidence that exists suggests that poverty, more often than not, increases the incidence of crime in rural communities (Barnett & Mencken 2002).

This theory, evidence and experience connecting poverty reduction, inclusion, social cohesion and community safety provides support for an “inclusive social development” approach to community safety. As a broad approach, inclusive social development entails a rejection of the laissez-faire idea that economic development is inherently good for everyone—that a rising tide lifts all boats—and a commitment to putting in place the policies and programs that help the most marginalized people benefit from economic growth and change. Pulling this approach into its 2014 Guidelines for the Prevention of Crime, under the heading of “Social Development,” the United Nations has stated:

Governments should address the risk factors of crime and victimization by:

- (a) Promoting protective factors through comprehensive and non-stigmatizing social and economic development programmes, including health, education, housing and employment;
- (b) Promoting activities that redress marginalization and exclusion;
- (c) Promoting positive conflict resolution;
- (d) Using education and public awareness strategies to foster a culture of lawfulness and tolerance while respecting cultural identities (UN 2014: 9).

This influential set of guidelines points toward the kind of social cohesion that actually works to prevent crime and keep communities safe for all residents. It is not the social cohesion that can “naturally” occur in rural communities—the tight bonds based on strict, protected differentiation of insiders from outsiders or set by influential families. It is a kind of social cohesion that, in theory, underpins greater social capital and community capacity, insofar as it is premised on inclusion and the prevention of stigma and marginalization. While the urban bias of the research on which these guidelines are based must be borne in mind, it stands to reason that these generic principles work, perhaps with some local modifications, in rural communities.

## Crime Prevention and Community Safety in Rural Communities

The rural crime and safety research collected for this report underscores the relevance of the guidelines above. Scott and Hogg’s research has noted the role that “small town gossip” plays in “the construction of stereotypes and categorization of people in the community and determines who is, and who is not, accepted” (2015: 175). Young rural residents are especially affected by these stereotypes and “feel alienated in rural communities” (175). Nova Scotian communities are already worried about the effect that alienation has on youth outmigration from rural communities (Foster & Main 2018), but the same factors can lead to criminal and other negative behaviours (Scott & Hogg 2015: 175). Urban research, as mentioned earlier, has found that neighbourhood watch-type initiatives invariably lead to neighbours monitoring one another and targeting specific groups, such as youth, immigrants, or people experiencing poverty (Mols & Pridmore 2019: 285; *cf.* Yanay 1994). While these studies were conducted in cities, they point to a crime preventative factor that is already considered an aspect of social capital and might be key to building community capacity, fostering the “right” kind of social cohesion, and making communities safer: trust. This point will be returned to in the section below on recommendations.

The importance of reducing inequalities and mitigating poverty as part of a crime prevention plan is less prominent in the UN guidelines, but not entirely absent. The guidelines encourage nations to consider the impacts poverty and unemployment have on crime and work to redress them (UN 2014: 12), and the broader inclusive social development approach endorsed in the guidelines puts inequalities and poverty in the crosshairs of any economic or social development program.

*D. Policing: Relationships, Trust, and Local Knowledge*

Policing rural communities is distinct from urban law enforcement. Numerous studies have found that rural policing entails more “discretionary practices”—that is, police using contextual

## Crime Prevention and Community Safety in Rural Communities

knowledge to decide, in the moment, how to handle any given problem (Wooff 2015: 295; Griffiths 2019). Environmental conditions in rural communities—“notably a lack of nearby back-up [and] bureaucratic challenges associated with part-time working”—shape the experiences of police officers and residents (Wooff 2015: 295). Police in Wooff’s study emphasized the more acute need for “situated knowledge of the community” in rural policing (2015: 295). This kind of knowledge is difficult to glean from a book; there seems to be an agreement in this literature that situated knowledge is possible only for officers who have spent considerable time in or, better yet, are from rural communities. In a study of policing in Nunavut, Griffith’s observed a lesson that is probably applicable to most rural locales:

Officers previously posted to Inuit communities in Nunavut noted that those officers who were raised in farming communities and small towns tended to be more “people smart” and to have skill sets that translated to remote environments than officers from urban centers. In the words of one officer, “Those people who were raised in a small town have a greater appreciation for knowing their neighbors, being a little bit more compassionate, being easy to talk to” (Griffiths 2019: 256).

These traits make officers’ jobs easier because they are found to build trust between communities and law enforcement. Like Wooff (2015), Griffiths (2019) has found that “effective crime prevention programs require relationships between the police and the community based on public confidence in, and the legitimacy of, the police” (252). Accordingly, Lindstrom (2015) has found that even if, in theory, police can be dispatched from further away in as much time, the closure of local police stations entails a crucial loss of rural policing skills (and contextual knowledge of the locale) (Lindstrom 2015: 276), which may lead to less effective crime prevention and diminish community safety.

However, there are different ways to “localize” policing, and not all of them are good. In the United Kingdom, beginning in the late 1990s and early 2000s, the centralized police service was replaced with elected “police and crime commissioners” (Joyce 2011). The goal was “to restore a degree of local control over police affairs” among “a whole range of community affairs”

## Crime Prevention and Community Safety in Rural Communities

that were transformed around the same time (Joyce 2011: 8). But the police commissioner system has been roundly criticized for investing one person with unchecked power (9). The risk of corruption with the police and crime commissioners is very high, but that risk and the dire need for transparency in rural policing is present no matter how local law enforcement are organized. Shukla et al. (2019: 206) have noted that rural police may be more prone to corruption given the potentially strong ties between them and the populations they are policing. Thus, like most crime preventative factors at the local level, even localized policing has a double edge that must be carefully blunted.

*E. Evaluation: Finding and Supporting What Works*

One part of establishing and maintaining transparency in any community endeavor is evaluation. Rural community safety research reveals both the challenge of robust program evaluation and the need for it. Leonard et al. (2005: 236–37) have urged community safety and crime prevention initiatives to incorporate methods such as randomized controlled trials as well as qualitative in-depth methods, with the latter being potentially more “realistic in some settings, particularly in at-risk, high-need community settings” (240). The CPIF was designed to make evaluation a mandatory part of funded programs, but scanning the results of completed projects shows that most evaluations were not long enough to measure meaningful results. For example, a follow-up of 12–24 months after an early-intervention program with young children cannot possibly tell us whether it is helpful in preventing crime later in life. This problem is not unique to Canada. Savolainen (2005) found that that evaluations of Finland’s crime prevention programs showed no impact on crime rates and noted that lack of adequate evaluation has been one of the main criticisms made of similar strategies across the world (188). The primary problem is that the community groups leading crime prevention or community safety initiatives do not have the

expertise or the resources to actually undertake evaluations, and funding cycles are too short to support longitudinal evaluations.

#### **IV. Recommendations**

Bearing in mind the urban bias of extant community safety research, the heterogeneity of rural communities, and the inconsistent support for even the most dominant criminological theories in rural areas, it can nevertheless be said that rural Nova Scotia needs community safety programming that can be tailored to the unique needs of specific rural communities, that works to mitigate marginalization and stigmatization, that emphasizes social development, and that have the resources, infrastructure, and operational support to facilitate community engagement and ongoing evaluation. There are several more specific steps that would make progress toward this goal.

##### **1. Nova Scotia Needs a Provincial Rural Development Strategy**

Only some of Canada's provinces have a rural development strategy, and even fewer have a body dedicated to province-wide rural social and economic development (Hayes and Krawchenko 2022). Combining the critical insights from the foregoing research about community capacity and responsabilization with the widespread consensus that community safety stems from inclusive social development, it is clear that even a localized, bottom-up approach needs stable, sustainable funding; reliable and standardized (albeit customizable) approaches; supplementary expertise, which might not reside in community; and access to research and evaluation services. These conditions are not realistically going to arise from a small rural community alone, and history shows that structuring support in the form of short-term project-based grants just creates a churning, choppy community safety approach. A dedicated rural development strategy, along with the operational and monetary resources to support it, as well as, ideally, an office of

## Crime Prevention and Community Safety in Rural Communities

government responsible for stewarding it, is arguably the best way to improve the social and economic conditions in rural communities. Based on the crime prevention and community research examined here, it is clear that inclusive, tolerant communities where people trust each other and where resources are more equitably distributed are also safer communities. Thus, a carefully coordinated and sustainable rural development strategy is, by default, a rural community safety strategy.

## **2. Social Development Should Build Trust and Community Capacity**

Whether they are nested in a comprehensive rural development strategy or not, efforts to improve community safety will be well served by an emphasis on the interrelated factors of trust and community capacity. Thankfully, there are models to guide the development of both. The Aspen Institute, as mentioned above, has developed a “Workbook” for communities looking to build capacity and then measure their progress. The workbook aims to:

Improve the ability of individuals, organizations, businesses and government in their community to come together, learn, make well-reasoned decisions about the community’s present and future, and work together to carry out those decisions—that is, to build their community’s capacity (Aspen Institute 2009: 1).

It contains, essentially, a crash course in community development and evaluation. The risk entailed in such a resource is that it further facilitates the responsabilization of communities that lack the resources to mount a sustainable safety strategy. Thus, it would be better used as a guideline for a larger provincial government strategy that mobilizes the necessary resources and provides an overarching framework for communities to tap into. While every rural community needs a plan tailored to its specific context and resources, it is also silly for every community to have to reinvent the wheel alone. As the basis for a larger framework, capacity-building helps justify allocating resources to programs and initiatives without requiring them to promise an economic return. This would be a shift for Nova Scotia: Krawchenko (2016: abstract) has found

## Crime Prevention and Community Safety in Rural Communities

that “governmental funders” in Atlantic Canada “prioritize economic and business development objectives above social, cultural, and community-oriented ones. These preferences shape the types of projects that are funded and the community groups that propel them, undermining the adoption of truly neoendogenous, community-driven practices.”

One component of capacity-building that emerges as especially important, particularly given the tendency of social cohesion to devolve into marginalizing and stigmatizing crime responses, is community trust-building. The University of Minnesota Extension department has a resource on trust-building that lays out different kinds of trust, ways to build trust, how trust features as a component of social capital, and links to further research and resources. The entire resource is tailored to rural communities.<sup>5</sup> It is worth noting that Nova Scotia has relatively recent data on trust that could serve as a baseline for any evaluation: Engage Nova Scotia’s Quality of Life Initiative collected surveys from over 12,000 residents in 2019, including a suite of questions pertinent to social trust.<sup>6</sup> The newness of this data means analysis is scant, but one team of researchers has examined Nova Scotians’ trust in institutions—NGOs and businesses seem to be at the top, and federal and provincial governments at the bottom in most regions—and advocate for “trust-based” community wellness programming. If trust is the basis for wellbeing programming, it may offer lessons for crime prevention too (Flood & Laurent 2021).

### **3. Nova Scotia Should Dedicate Resources to Strengthen Community and Family Responses to Domestic Violence**

Given the connections that appear from media reports to be present between the events in Portapique in April 2020 and domestic violence, and on the basis of rural research on domestic

<sup>6</sup> See the Quality of Life Initiative webpage at the Engage Nova Scotia website: <https://engagenovascotia.ca/about-qol>.

## Crime Prevention and Community Safety in Rural Communities

violence, it seems imperative that any broad social development or narrower community safety strategy should entail a significant effort to address domestic violence. The research examined here finds that rural women are at increased risk of domestic violence, and their efforts to get to safety are stymied by communities that seek to conceal or diminish their experiences and by service providers that are inaccessible to anyone with limited resources (for example, without access to a personal vehicle). More community consultation is needed to determine exactly what should be done, but it may include education about what domestic violence looks like, supporting satellite domestic violence services in rural communities, and carefully considering the conditions of eligibility for such services.

#### **4. Nova Scotia Should Localize Frontline Law Enforcement Services**

The research on rural policing examined here points to the need for officers who know their communities but have oversight to ensure transparency and equity. As Wooff has noted, rural policing should not be considered “an appendage of urban policing” (2015: 294). Griffiths (2019) has found great

potential to develop a model of policing of community policing that is more personalized and less anonymous than is found in urban centers and that is appropriate for the needs of individual communities. This model includes a destructuring of centralized “command and control” hierarchies and the empowerment of line-level officers to work with communities to identify local policing priorities and to fashion community and culturally appropriate initiatives (Griffiths 2019: 259).

Where Nova Scotia’s rural communities are currently served by a mix of RCMP and local municipal detachments, in many cases staffed by officers rotating through short-term rural placements, there is a need to consider how to recruit law enforcement with local, situated knowledge, particularly in communities with higher populations of Indigenous peoples and African Nova Scotians. Relatedly, greater racial and gender diversity in local police services should be the goal.

## V. Conclusion

Despite a relative paucity of rural research on community safety, this report has found some general, sensible, and very likely transferable (with some evidence-based and context-driven modification) lessons from the broader, urban-dominated literature on community safety. At the heart of community safety approaches, no matter where they are implemented, is the goal of meaningful, inclusive community involvement in identifying risks, imagining ways to mitigate them, and carrying out crime prevention initiatives. There are pitfalls in community engagement, and in community safety it is particularly important to understand and work to overcome the crime-facilitating effects of tight social bonds, as well as the socially constructed nature of crime and the attendant risk that crime prevention will feed into pre-existing suspicions about marginalized and stigmatized groups in any given community.

Crime and safety also need to be understood as deeply enmeshed in the larger fabric of society. They are shaped by structural factors, most notably social inequalities, and thus any community safety policy or initiative needs to be grounded in a much deeper effort to nurture inclusivity and equity across social domains. It is impossible to build safe communities on foundations shaken by poverty, racism, xenophobia, and gender-based violence. These interrelated issues require the commitment and cooperation of rural residents, elected officials, law enforcement, and other public or social services.

It is also critical to acknowledge that most rural communities do not have the capacity to handle community safety on their own; they need financial resources, expertise, and labour, and they need this to be coordinated and assured by a body with more capacity, such as a provincial government. There is great potential for community safety approaches to be efficient and integrated, for example if they are funded, supported, and evaluated as part of a larger rural development strategy.

## Executive Summary

This report addresses the issues of intimate partner violence (IPV), coercive control, and responses from law enforcement to these phenomena. The literature circumscribes different phenomena of violence such as IPV, gender-based violence, family violence, domestic violence, and coercive control, which are distinguished in the first section of the report. The distinction helps refine the focus of the report mainly towards intimate partner violence and patterns of violence (coercive control). A detailed discussion of intimate partner violence, inclusive of both physical and non-physical violence is included, along with tactics and impacts of coercive control behaviours.

Coercive control is the central thread of the report and is perceptible in each section presented as well as in the overall issue of violence against women in intimate relationships. Recent research has demonstrated that women in Canada continue to be more likely than men to be victims of intimate partner violence (Conroy 2021a; Conroy 2021b). This report therefore focuses on women in abusive relationships, with attendant discussion of coercive control, theories on violence in relationships, barriers to leaving an abuser, challenges in reporting intimate partner violence to the police, as well as police officer perceptions of intimate partner violence.

Intimate partner violence comes to the attention of the criminal justice system through law enforcement. Police officers therefore have an important role to play in recognizing the prevalence of the issue and in determining potentially criminal behaviour. Section V of the report looks at police understandings and perceptions of intimate partner violence before examining police assessments of intimate partner violence, once again including considerations of coercive control. Various risk assessment tools in use by police in Canada and the United Kingdom (including B-SAFER, SARA, ODARA, and DASH) are critically examined for their inability to address and recognize patterns of violence.

## **I. Introduction**

The issue of violence in relationships is complex and can encompass various forms of violence and abuse and involve different actors. The distinct but sometimes overlapping phenomena of gender-based violence (GBV), intimate partner violence (IPV), coercive control, and family violence have their own specificities and require diverse responses. In this report we address the distinctions between those different types of violence, then focus on intimate partner violence, as it is “one of the most common forms of violence against women and includes physical, sexual, and emotional abuse and controlling behaviours by an intimate partner” (WHO 2012: 1).

There is vast literature covering gender-based violence, intimate partner violence, coercive control, and family violence, and we define them in order to highlight their differences as well as to refine the discussion specifically towards intimate partner violence and coercive control. Throughout this report, the pattern of violence, namely coercive control, is brought to the forefront, as it is one aspect of intimate partner violence not well understood, despite the fact it is omnipresent in abusive relationships (Johnson 2008; Stark 2007). We define intimate partner violence and coercive control and discuss how they are issues of gender. We also elaborate on the tactics of coercive control and its impact on victims, which leads into our subsequent discussion on barriers that prevent victims from leaving abusive partners and the police response to violence in intimate relationships. In this report, “violence” is considered to include both physical and non-physical tactics and patterns of behaviour. This is supported by the WHO (2014) definition of intimate partner violence, which includes “physical, sexual or psychological harm, including physical aggression, sexual coercion, psychological abuse and controlling behaviours,” and Stark’s (2007) emphasis on non-physical dynamics of power and control against a victim that include threats, humiliation, and intimidation to elicit fear and harm.

After examining the prevalence of the issue in Canada, we discuss the difficulties in leaving an abusive relationship. It can be difficult to understand how people engage in violent relationships, and it can be hard to comprehend the challenges faced by victims trapped in abusive relationships. Barriers take multiple forms and can inhibit a victim from leaving a relationship. We also discuss coping strategies adopted by victims and the reluctance to report situations to law enforcement. We acknowledge the fact that it is difficult to report due to the pattern of violence that victims are caught in, which generates fear. The thread of coercive control as a pattern of violence is central to understanding both police perceptions of intimate partner violence and the limitations of police officers' use of IPV risk assessment. Despite the criminalization of physical violence and harassment in relationships, police tasked with responding to intimate partner violence still regularly fail to recognize its severity and extent. One factor that contributes to this failure is the fact that coercive control is not yet captured in the Criminal Code, making it difficult to define, study, and respond to this phenomenon.

## **II. Defining Forms and Patterns of Violence**

### **1. Definitions**

There is no universally agreed upon terminology or definition to summarize events of violence within relationships. Vast amounts of research cite “gender-based violence,” “family violence,” and “intimate partner/domestic violence” to describe forms of violence and abuse that are consistently highlighted as predominantly inflicted against and experienced by women. Recently, the term “coercive control” has also gained traction and recognition. This term emphasizes the long-term nature of harm that results from continued experiences of abuse as opposed to one-time or periodic incidents of physical violence. While these terms often include overlapping criteria, resulting in the frequent interchanging of terminology, we also consider that they encompass

## Understanding Violence in Relationships

unique specificities and capture various contexts, rates of perpetration, and tactics of violence. Current definitions of each are provided here, along with discussions of their differences and limitations.

The most inclusive term is that of “gender-based violence” (GBV). Gender-based violence is defined as violence experienced due to a person’s gender or how they express it (Perreault 2020). In addition to physical violence, gender-based violence may also include more covert behaviours that are not criminal yet still cause victims to feel unsafe and threatened and can have long-term physical and emotional impacts (Cotter & Savage 2019; Perreault 2020). As a result, women, especially those who identify as Indigenous, 2SLGBTQ+, live with disabilities, and/or reside in rural or remote locations, are at much higher risk of experiencing gender-based violence (Cotter & Savage 2019). While this definition of gender-based violence highlights that women – especially those experiencing increased vulnerabilities and marginalization – are often the primary targets, the term does not refer specifically to violence that occurs within a relationship. Victims of gender-based violence may be targeted by individuals or groups outside of their circle of intimate relationships, families, or known persons.

In contrast, “family violence” is frequently used to denote any violence or abuse committed against someone who shares a familial relationship, including current or former intimate partners as well as extended family such as parents, children, grandparents, cousins, or in-laws (Conroy 2021a; Johnson & Dawson 2011). While this term incorporates and recognizes abuse perpetrated between intimate partners, it also includes the harm, control, and neglect that may be carried out amongst family members, that is, in relationships where there is an additional expectation of trust and caregiving. Canadian statistics of family violence in 2019 determined that 31% of police-reported family violence was perpetrated by a spouse, 13% by a former spouse, 20% by a parent,

11% by a sibling and 11% by a child (Conroy 2021a: 4). The remaining 14% of police-reported family violence was not specified; however, may include violence perpetrated by extended family members (i.e., grandparent, uncle) as this relationship category was also included in the definition of family violence, but no specific data included<sup>1</sup>. Gendered differences were noted insofar as within these categories, women were more frequently the victims of spousal violence, whereas men experienced higher rates of abuse perpetrated against them by a relative (Conroy 2021a). The dynamic of a relationship between non-spousal relatives is different to that of an intimate partner, resulting in abuse that occurs for alternative motives and is perpetrated under different circumstances (Johnson & Dawson 2011).

“Intimate partner violence” (IPV) is defined as behaviours occurring solely between current or former intimate partners, whether or not currently living together (Cotter 2021). It may include physical violence as well as sexual, psychological, or emotional harm (Johnson & Dawson 2011; WHO 2014). The term “domestic violence” is also commonly used interchangeably within literature to refer to this scenario; however, it can lead to assumptions that such violence takes place only within single home/family contexts. Considering the wide range of relationship dynamics that contain various degrees of sexual intimacy or geographical proximity, the term “intimate partner violence” more fully encapsulates all affected individuals and does not restrict our perceptions to only considering those who are legal spouses and/or residing in the same household (Johnson & Dawson 2011).<sup>2</sup>

---

<sup>1</sup> The Family Violence in Canada (2019) report also encompasses data on police-reported violence against seniors and children that are more frequently perpetrated by non-intimate partners such as casual acquaintances, neighbours, strangers, or roommates.

<sup>2</sup> Throughout this report we occasionally refer to “domestic violence,” as researchers continue to use this term interchangeably with intimate partner violence.

## Understanding Violence in Relationships

When concentrating on intimate partner violence, research suggests that women consistently experience more severe forms of violence compared to men, are more likely to receive injuries, and more often report feelings of fear and being controlled by their male partner (Cotter 2021). Statistics also identify that women report far greater incidents of name-calling, being prevented from speaking to others, and increased supervision, such as a male partner demanding to always know their whereabouts (Cotter 2021). These non-physical forms of abuse are not criminalized *per se* in Canada; but they reflect tactics that can be summarized as “coercive control.” In this report, coercive control is defined as an ongoing pattern of behaviour used by perpetrators to gain power and control by diminishing a partner’s autonomy and self-esteem (Stark 2007). While gender-based violence and coercive control share similarities in that their effects result in the violation of an individual’s human rights, coercive control is an ongoing pattern of abuse targeted at a specific intimate partner that can result in the long-term consequence of loss of freedom, confidence, and self-esteem (Stark 2007; Wiener 2017).

## **2. Intimate Partner Violence and Coercive Control**

Coercive control better conceptualizes the ongoing patterns of abuse and accumulation of harm that occurs through both time and space as opposed to the incident-specific and injury-inducing violence that predominates in current definitions and law enforcement responses towards intimate partner violence (Patafio et al. 2022; Robinson & Myhill 2021). In his seminal book on coercive control, Evan Stark (2007), a sociologist and forensic social worker drawing from experiences working with and advocating for hundreds of victimized women, described it as a “liberty crime,” as it denies a woman’s autonomy, undermines her dignity, and deprives her a sense of freedom and safety, ultimately trapping her within an abusive relationship. Speaking from the perspective of a “battered women’s activist,” Arnold (2009) has considered Stark’s definitions to reflect the

## Understanding Violence in Relationships

most severe end of the spectrum of control, where a victim is completely dominated, has lost all autonomy, self-esteem, and ability to make her own decisions. While various research understandings exist as to what constitutes “coercive control,” three commonalities emerge: 1) perpetrators have intent to gain and exert control over their partners; 2) victims also view the behaviour as negative; and 3) perpetrators are able to make credible threats towards their victims (Hamberger et al. 2017). Overall, Stark (2007) has suggested a pattern of coercive control may employ threats, intimidation, stalking, degradation, isolation, humiliation, shaming, and the micro-regulation of daily activities.

The association of violence with coercive control differs from traditional understandings of physical violence and intimate partner violence. Research into coercive control suggests that non-physical abuse may result in more cumulative harm than sporadic events of physical violence and injury (Robinson & Myhill 2021). Whereas physical violence may be the primary tactic used to dominate a partner in a “typical” intimate partner violence scenario, coercive control presents as an overall dynamic of a relationship, with physical violence used as a means to maintain this control and show that threats are credible (Hamberger et al. 2017; Patafio et al. 2022). Additionally, physical violence may never occur in a relationship until the perpetrator’s control is challenged. Such scenarios of a single explosive use of violence may result in homicide (Arnold 2009), and research shows that coercive control is a risk factor for intimate partner homicide (Johnson et al. 2019; Monckton Smith 2020). However, physical and sexual violence are high on conventional hierarchies of violence, while non-physical violence, such as that which often characterizes coercive control, is minimized. Monckton Smith (2020) has emphasized, “when we cannot see any violence and we cannot hear any threats, when all that is left is the control, it is the perfect undetectable storm” (118), and we should not just look for or expect to see bruises and

broken bones to justify serious abuse taking place; doing so results in missing many situations that are equally as severe. Understanding coercive control in the context of intimate partner violence requires a shift in how these situations are viewed.

### **3. Gender and Coercive Control**

Research has persistently identified gendered patterns of intimate partner violence, with perpetrators of coercive control being predominantly male and victims being predominantly female (Robinson & Myhill 2021; Stark 2007). Even though women have gained increased autonomy and freedoms in many societies in recent decades, men continue to hold positions of dominance (Robinson & Myhill 2021), and women's subordination persists in both the public and private spheres (Anderson 2009; Arnold 2009). Women collectively continue to experience a "glass ceiling" in employment, economic inequality, and fewer disposable resources, making it much more difficult to leave relationships (Arnold 2009).

Heterosexual relationships, in which coercive control predominantly manifests, tend to adhere more closely to stereotypical understandings of masculinity and femininity, and coercive control is sometimes employed to enforce such roles within relationships. Traditional gender roles encourage women to be – or to be viewed as – submissive and dependent, whereas men are expected to be dominant and assertive (Anderson 2009; Myhill 2015). Within the context of a relationship, this can translate to expectations that the male will pursue a female partner, make decisions, and take control, resulting in many instances of coercive control going unrecognized, as they are masked by normal gender performances (Anderson 2009). Gender norms also relegate women to household tasks such as cooking and cleaning, as well as raising children (Arnold 2009). The micro-regulation of daily activities, a form of coercive control highlighted above, centers around these traditional roles of what it means to be feminine and masculine (Anderson 2009). It

reinforces patriarchy (Arnold 2009) and reflects historical gender norms, resulting in women being at greater risks of victimization. It also explains why it is an exceptional circumstance when coercive control is successfully inflicted by a woman against her male partner (Myhill 2015; Stark 2007).

#### **4. Tactics of Coercive Control**

Coercive control begins small. Intimate relationships rarely begin with overt abuse; instead, victims are groomed (Wiener 2017). Leslie Morgan Steiner (2012), a survivor of intimate partner violence, has outlined how she became a victim through a gradual process of manipulation from her spouse. Initial behaviours on the part of a potentially coercive partner such as displays of infatuation, close attention, and care can easily be interpreted as romantic gestures. Wiener's (2017) interviews and focus groups with female survivors of intimate partner violence also reveal such grooming strategies. These women, many of whom had experienced abuse from more than one intimate partner, described how they were overcome with the initial intensity of the relationship, quickly giving their abuser access to their homes, families, and deepest secrets (Wiener 2017). The perpetrator is then able to concentrate his actions and expectations on these extremely personal areas that will be known to have the greatest impact (Stark 2007).

Ongoing tactics take many forms and vary from relationship to relationship. Examples described here are not exhaustive and instead merely provide a sample of behaviours of coercive control. A perpetrator may stalk or closely monitor the victim's whereabouts, embarrassing her in front of family, friends, or colleagues (Arnold 2009). Emotional abuse may be inflicted through put-downs, name-calling, and constant criticism, as well as by removing the victim's access to support networks by isolating her (Wiener 2017). More specific tactics may be exhibited through denying or limiting access to transportation, denying household utilities such as heat or water,

## Understanding Violence in Relationships

controlling food consumption, removing or breaking telephones so the victim is unable to speak to anyone or call for assistance, preventing attendance at work or school, and making her request or beg for money (Sharp-Jeffs 2017). Stark's interviews with female victims of coercive control (2007) resulted in descriptions and experiences similar to those suffered by prisoners, hostages, and kidnap victims. The women reported humiliating physical examinations, interrogations, lockdowns, denial of access to hygiene routines, being kept on strict eating or sleeping schedules, being talked about in the third person as if they did not exist, and forced silences (Stark 2007).

While in the past, a perpetrator's absence from the home may have allowed moments of reprieve for the victim, recent developments in technology mean that some perpetrators now have the ability to control and monitor victims without being physically present. Technology-facilitated coercive control can take many forms, such as installing spyware on the victim's phone, enabling GPS tracking devices onto vehicles, and sending persistent and/or threatening messages through various portals such as text messages, social media accounts, or email (Cuomo & Dolci 2021). Dragiewicz et al. (2018) have described harassment through social media accounts either to the victim and/or her close friends and family, impersonating the victim online, distributing private information, and sending and uploading personal and private content designed to humiliate or embarrass the victim. Combinations of these tactics, especially with the presence of technology, make it even more difficult for a victim to make attempts to leave without alerting the perpetrator. Even in a situation where a victim feels she has successfully terminated the relationship, a perpetrator of coercive control may continue to have the means by which to monitor and harass his target. This reality results in many victims feeling as though they can never escape the abuse.

### **5. Impacts of Coercive Control**

The overall impacts of experiencing and living with coercive control pervade multiple aspects of a victim's life, including her behaviours and actions, health, appearance, employment, education, and relationships with family and friends (Hamberger et al. 2017). Wiener (2017) has emphasized that living with coercive control chips away at a victim's sense of autonomy and self-worth, referencing narratives from survivors who described being trained to blame themselves for their partner's behaviours and losing their confidence to make their own decisions about their life (Wiener 2017). As an activist, Arnold (2009) has supported Stark's (2007) conclusions about coercive control, confirming that survivors are conditioned to believe that the perpetrator is always present and knows their every move, resulting in continued feelings of being trapped and unable to make their own decisions. As Williamson (2010) has described, "the impact of living within an unreality of someone else's making is that you become paralyzed. This woman cannot do anything because whatever she does is wrong" (1415). With developments in technology, this constant fear and surveillance may not end even upon physical separation, resulting in exhaustion and feelings of hopelessness (Cuomo & Dolci 2021).

A victim of coercive control is conditioned to respond in certain ways towards her abuser. She is not selected or victimized because she is already vulnerable, an easy target, or "weak," even though to outside observers her responses to coercive control may appear as compliance or dependence. This can result in criticism for not being a "true" victim, suspicion of mental illness, or accusations of exaggeration because there is no obvious evidence of physical abuse (Stark 2007; Wiener 2017). It has been recorded that many victims of coercive control suffer from poor mental health, including depression, anxiety, and post-traumatic stress disorder (Crossman et al. 2016). However, these conditions are usually the effects of living in an abusive relationship rather than the cause. In a study by Williamson (2010), none of the women had had a history of mental health

disorders until their experiences living in an abusive relationship, and some symptoms persisted even following the termination of the relationship, such that the women suffered from fear, anxiety, and triggering experiences for years to come.

### **III. The Prevalence of Intimate Partner Violence**

It is difficult to measure the prevalence of intimate partner violence, as not all situations are disclosed or reported, and some victims may attempt to disclose or indicate a problem but are ignored or dismissed (Leisenring 2011; Wolf et al. 2003; Wydall & Zerk 2021). This means that we have no comprehensive data about those who experience violence in their relationships. Therefore, it is important to be cognizant of the difficulty in reporting when considering the pervasiveness of intimate partner violence in Canada. We depend on police reports and self-reported surveys to capture how widespread the issue is. In this section, we provide a broad picture of the specificities of intimate partner violence in Canada, examining who the victims are, the forms of abuse they encounter, and the impacts of such violence. We also provide a description of intimate partner homicide, the ultimate form of violence in relationships, as it gives a clear picture of which individuals are more at risk of being killed in an intimate relationship.

The most recent report of intimate partner violence by Statistics Canada was released in October 2021 (Conroy 2021b). Analysis was based on self-reported data from the 2019 General Social Survey (GSS) on Canadians' safety (victimization). It did not consider police-reported cases but instead concentrated on disclosures from a sample of the general population (22,412 respondents) who were married or living with a common-law partner, as well as a sample of those who were separated or divorced but had contact with their former partner in the previous five years. The terminology used was "spousal violence," a narrower term than our preferred definition of intimate partner violence, which also encompasses dating relationships. The 2019 GSS marked the

twenty-year period for which Statistics Canada has compiled data on victimization and shows that “Spousal violence is significantly lower in the provinces in 2019 than 20 years prior (19% in 2019 versus 28% in 1999)” (Conroy 2021b: 4, 5), and “the large majority (80%) of spousal victims said the violence they experienced was not reported to police” (Conroy 2021b: 11). Considering that the analysis was based on self-reporting, it is possible that fewer people simply reported intimate partner violence in 2019. What remains unchanged is that women continue to be more likely victims of spousal violence than men “1.5% versus 0.8%” (Conroy 2021b: 7). The report also highlights that violence is more common in former spousal relationships compared to current relationships: “Almost half (45%) of victims of a former spouse said they experienced violence after separation and, of these, nearly four in ten (38%) said the violence occurred more than six months after their separation” (Conroy 2021b: 7). This is corroborated by additional research that shows that actual or pending separation is a risk factor for intimate partner violence and intimate partner homicide (Dawson & Piscitelli 2021).

The report by Statistics Canada highlights differences between forms of violence used by men and women. Severe forms of violence are experienced by women, such as “to be pushed, grabbed or shoved (72% of women versus 52% of men), sexually assaulted (17% versus 7.4%) or choked (14% versus 3.4%) by their spouse” (Conroy 2021b: 8). In comparison, men are commonly victims of their spouse “throwing something that could hurt them (60% versus 39% of women), kicking, biting, or hitting them (43% versus 18%) or slapping them (37% versus 17%)” (Conroy 2021b: 8).

Gendered differences are also apparent when considering impacts of abuse. Women are more likely than men to experience negative emotional impacts after an episode of violence, such as feeling upset, hurt, disappointed, angry, annoyed, fearful, isolated, or lowered self-esteem, to

## Understanding Violence in Relationships

name a few, “while men were more likely than women to say they felt no emotional impact” (Conroy 2021b: 9). A previous report by Gabora et al. (2007) also highlighted studies that assessed emotional impact. Women who committed violence against their male intimate partners were more likely to report feelings of continued fear in the relationship, whereas men were more likely to consider that their female partners’ attempts at violence against them were humorous or insignificant (Gabora et al. 2007).

Statistics Canada has also recently published a statistical overview of police-reported family violence (Conroy 2021a). It covers various forms of violence encountered within the family, including violence against children, youth, and older adults, as well as intimate partner violence. In 2019, 107,810 victims reported an incident of intimate partner violence to the police in Canada (Conroy 2021a: 29). These reported incidents were most often perpetrated by “a current boyfriend or girlfriend (36%) or a spouse (29%)” (Conroy 2021a: 29). While just over half (53%) of victims of violence were female, the vast majority (79%) of victims of intimate partner violence specifically were women (Conroy 2021a: 29), and there was no difference whether they lived with the perpetrator or not. The most common form of violence was recorded as physical assault, followed by other offences such as threats of violence and sexual assault. These specific forms of violence are criminalized in Canada. The Criminal Code does not include an offence of intimate partner violence or coercive control. Crime statistics are shaped by what is defined as criminal conduct, and this report about the relative frequency of these forms of violence should be interpreted in a manner that does not overlook these limitations of data collection.

In terms of the rates of intimate partner violence per 100,000 people across Canada, Saskatchewan (724) and Manitoba (607) appear to be the provinces with the highest rates of intimate partner violence, while Ontario (251) and Prince Edward Island (270) had the lowest in

## Understanding Violence in Relationships

2019 (Conroy 2021a: 31). The rate of police-reported intimate partner violence per 100,000 in Nova Scotia was reported to be 354 (Conroy 2021a: 40) and had increased by 14.3% in 2019 compared to 2016 (NS Advisory Council 2021). Each of the territories had far greater rates compared to the rest of Canada, with Nunavut reporting the highest overall (5,249), followed by the Northwest Territories (4,083) and Yukon (1,365) (Conroy 2021a: 31). Additionally, there was a significantly higher rate in rural areas compared to urban areas (548 versus 300 per 100,000 population). Women victimized in rural areas experienced “a rate of intimate partner violence that was 3.5 times higher than men (860 versus 246),” and “Indigenous people are twice as likely to experience spousal violence compared to non-Indigenous people” (Conroy 2021a: 31).

Women are overrepresented in the most dangerous form of violence: homicide. Eight in ten (80%) of the 497 victims of intimate partner homicide in Canada that occurred between 2014 and 2019 were female, and a majority (75%) were killed by their current or former spouse or common-law partner (Conroy 2021a: 30). It appears that increased rates of homicide occur when partners live or have lived together, as there were far lower rates of homicide (25%) among relationships that were classified as “dating” (Conroy 2021a: 30). According to the Canadian Women Foundation (2021), approximately every six days, a woman in Canada is killed by her intimate partner. Similar to the increased likelihood of experiencing spousal violence overall, Indigenous women represented 26% (125 victims) of “intimate partner homicide victims between 2014 and 2019” (Conroy 2021a: 30). The Canadian Domestic Homicide Prevention Initiative (CDHPI) documented trends and patterns of domestic homicides in Canada for the period 2010–2019 and found that “the majority of adult Indigenous domestic homicide victims were female (73%)” (Dawson et al. 2021: 18): “Research suggests that colonization, poor socio-economic

status, systemic and interpersonal racism, and intergenerational violence largely contribute to the heightened risk faced by Indigenous populations” (Dawson et al. 2021: 6).

#### **IV. Barriers to Leaving and/or Disclosing an Abusive Relationship**

Why do victims stay in abusive relationships? Why don't victims report their situations? For many people, what happens in the home is considered a private matter and should be dealt with only by the parties involved. Many of the characteristics of coercive control and intimate partner violence are viewed as a normal part of family life and perceived as common relationship conflict or simply a disagreement between partners. Several reasons preventing victims from leaving abusive relationships are highlighted throughout research, including the fear of recrimination or consequences; inability to point to real loss; low expectations of the criminal justice system; embarrassment, shame, or guilt for what has been experienced; concerns for their children; hope or disillusion that their partner will change, etc. (WHO 2012).

It can also be difficult for victims themselves to recognize that they are in an abusive relationship, as it is a gradual process that immerses the victim (Policastro & Payne 2013). Some women assess their relationship as positive, have emotional ties to their partners, and do not see any reason to leave even when there are violent incidents (Ben-Ari et al. 2003). Leaving an abusive partner relies on having basic needs such as housing (Anderson & Saunders 2003) and the financial means for self-support (and for children if there are any). If we take additional cultural or precarious immigration status into consideration (Sokoloff & Dupont 2005), victims may encounter language barriers and/or be dependent on their partners to live in Canada. These are only the initial challenges of leaving abusive relationships; survivors will often face further psychological, organizational, and institutional hurdles (Storer et al. 2021). Leaving is a long process involving multiple attempts and coping strategies to survive.

There are both internal and external factors that constrain the process of leaving an abusive relationship (Barnett 2000), including social pressures, the abuser's persistence, psychological factors, available resources, and institutional responses (Lacey et al. 2011). Reasons preventing help-seeking may be vast, intersect, and influence each other. To date, research on barriers that prevent victims from seeking help focuses mainly on women victimized in the context of their intimate relationship (Ansara & Hindin 2010). Therefore, explanations regarding the reasons why victims stay in abusive relationships are related to women.

### **1. Why Victims Stay in Abusive Relationships**

Different theories have been offered over time to explain why victims have difficulty leaving their abusers. For instance, Walker (1979) developed the “learned helplessness” theory, which suggests that abused women experience low self-esteem, blame themselves for what is happening, become passive, and do not seek help. In contrast, the survivor theory (Gondolf & Fisher 1988) views women as active in seeking help. While it may seem that women are passive and non-reactive, such behavior can be the result of coping strategies and self-preservation (Waldrop & Resick 2004) to protect themselves and their children. The power and control theory (Pence & Paymar 1993), also known as the Duluth model, provides an explanation for the lack of help-seeking from abused women: as women are caught in a pattern of controlling behaviour, it is difficult to overcome the pressure of the abuser. Johnson and Ferraro (2000) have refined the power and control perspective in light of the context, motive, and severity of violence, explaining that “intimate terrorism” (Johnson & Ferraro 2000: 949) is connected to a pattern of control and can involve severe violence over time. This work is important, as it is the first conceptualization of intimate partner violence to introduce the notion of a pattern of controlling behaviour in the context of violent situations.

## Understanding Violence in Relationships

Stark (2007) has since elaborated the theory of coercive control, explaining how abused women are trapped in their personal lives which prevents them from seeking help.

Regardless of theory, women in intimate partner violence situations develop coping strategies to survive in their relationships and to actively seek help even when it is not obvious to outside observers. The learned helplessness theory was widely adopted in the 1980s to try to make sense of women staying in abusive relationships. However, the power and control perspective offers more insight into the barriers faced by abused women as well as distinguishing different types of violence, motives of the perpetrators, and the contexts in which violence occurs (Johnson 2008). The work of Stark (2007) also sheds light on the level of control experienced by women, which functions to create further barriers to leaving abusers.

Research shows that initial factors preventing an escape from an abusive relationship are often economic and psychological (Anderson & Saunders 2003; Barnett 2000). Anderson and Saunders (2003) conducted a review of studies on women's decisions to stay or leave. These type of studies "began to appear in the mid-1970s" (165), and Anderson and Saunders wanted to understand what factors lead to leaving an abusive relationship. Economic reasons were found to be an important factor preventing women from leaving an abusive relationship: "Women who had a source of income independent of the abuser, including welfare, or who had incomes larger than those of their partners were much more likely to leave the abuser" (Anderson & Saunders 2003: 171). Barnett (2000) also reviewed studies and highlighted the problems of economic dependency as a major factor preventing a woman from leaving an abuser.

Leaving is a process that may take several attempts (Anderson & Saunders 2003; Storer et al. 2021). Storer et al. (2021) have conducted a study of Twitter users' reasons for staying in their abusive relationships using a sample of 3,086 tweets, employing the #WhyIStayed and #WhyILeft

## Understanding Violence in Relationships

hashtags from the period of September 2015 to October 2016. Among the emerging themes from their analysis, the decision-making process in leaving an abusive relationship appears to be complicated and takes significant time. As stated by Storer et al., “Recasting leaving as more of a process rather than a singular ‘turning point’ could help honor the hills and valleys that often accompany abuse survivors’ journeys navigating their relationships” (2021: 6571). Each time a victim attempts to leave, she learns different coping mechanisms. Fear is also central to the process of leaving and can hamper the attempts of abused women to actively seek help. Scheffer Lindgren and Renck (2008) conducted interviews with “fourteen women who had lived in heterosexual violent relationships” (114), finding that one central aspect of leaving was “the fearfulness as a driving force to leave” (115). In other words, when fear manifested, women were “forced to choose between leave or die” (Scheffer Lindgren & Renck 2008: 121).

The coping strategies that women experiencing intimate partner violence develop in order to survive may include maintaining a status quo position, refusing to recognize violence, handling the violence informally, and/or resisting the abuse (Johnson 2008; Scott 2016). These behaviours are used to prevent, minimize, and anticipate further violence (Haeseler 2013; Childress et al. 2018). In the context of the micro-regulation of everyday life, many victims lose their agency to resist the pattern of abuse (Williamson 2010). Through monitoring and isolation, women lose their autonomy and liberty, seriously constraining their ability to cope with non-physical tactics (Crossman & Hardesty 2018).

It is difficult to pinpoint commonalities across experiences of intimate partner violence that explain why victims find it difficult to leave. Leaving an abusive relationship is a non-linear process involving the recognition of intimate partner violence, the attempt to manage the issue privately, and seeking help formally or informally (Ansara & Hindin 2010). From an outside

## Understanding Violence in Relationships

perspective, it may seem easy for a victim to leave an abusive relationship, and it is not uncommon to hear the question: why doesn't she leave? It is important to take into consideration every aspect of an abusive relationship to fully understand what hinders an ability to escape. Research must therefore focus on diverse aspects of the process of leaving and help-seeking, including barriers faced by vulnerable groups, such as women with children (Pettersson & Thunberg 2021; Sheehy & Boyd 2020), women from rural communities (Mantler et al. 2021; Wendt & Hornosty 2010), women from racialized groups (Hulley et al. 2022; Shankar et al. 2013; St. Vil et al. 2017; Sokoloff & Dupont 2005), or Indigenous women (Hoffart & Jones 2018), to name a few. Having children with the abuser can prevent women from leaving, as it leads to major changes in family lives (Pettersson & Thunberg 2021). Difficulties regarding custody also lead women to stay because of issues between criminal and family courts and not wanting to engage in lengthy and expensive custody battles (Sheehy & Boyd 2020). Disclosing intimate partner violence by women living in rural communities is difficult, especially if there is a lack of privacy and trust. In rural areas, service providers are more likely to have a personal relationship with clients (e.g., be a relative), and services such as safe house/shelters may be widely known by community members as well as perpetrators instead of remaining inconspicuous (Mantler et al. 2021; Wendt & Hornosty 2010).

Racialized women experiencing intimate partner violence face barriers due to institutional racism (Hulley et al. 2022). Immigrant women also face barriers to leave an abusive partner related to their understanding of gender roles, the lack or no knowledge of support in the country of adoption, immigration laws, culture and religion, issues of cultural competence, and lack of diversity within frontline services (Shankar et al. 2013: 1). Hoffart and Jones (2018) have explained that “the relationships between the residential schools, the intergenerational trauma, intimate partner violence and the normalization of intimate partner violence” (38) has caused

Indigenous victims to view that “violence was normal and acceptable problem-solving mechanism” (40) and impact the ability to seek help. The common denominator amongst all victims of intimate partner violence is the lack of capacity to reach out formally or informally.

Using a subset of female respondents in the 1999 Canadian General Social Survey, Barrett and St. Pierre (2011) have examined sociodemographic differences in the overall use of informal or formal supports. They classified “a family member, a friend or neighbor, a coworker; a minister, priest, clergy, or other spiritual advisor” under informal support (Barrett & St. Pierre 2011: 54) and police, doctor or nurse, lawyer, crisis centre, counselor or psychologist, and other professional services as formal support. Sociodemographic variables such as visible minority, aboriginal, or immigrant status, education, income, geographic region, participation in religious activities, and language were analyzed. Their findings suggest that severe forms of physical violence lead women to seek help both “formally or informally” (Barrett & St. Pierre 2011: 58). Their findings also “indicate the importance of informal support from friends, family members, coworkers, and spiritual or religious advisors in the lives of women in marginalized populations” (Barrett & St. Pierre 2011: 63).

## **2. Seeking Help**

As explained above, the type of violence involved may impact help-seeking behaviour. While physical violence can leave physical evidence, non-physical violence often does not. As intimate partner violence is a pattern that evolves over time, it becomes extremely difficult for the victim to disclose what is happening and to consider the behaviour as a violent act or series of violent acts. Seeking help or disclosing intimate partner violence experiences is therefore complex and is commonly done through informal supports such as friends and family rather than through formal

## Understanding Violence in Relationships

channels such as the health care system, social services, or the criminal justice system (Ansara & Hindin 2010; Postmus et al. 2009).

Attitudes towards abused women (Flood & Pease 2009) and stigma attached to intimate partner violence (Overstreet & Quinn 2013) are not without consequences for survivors seeking help. Flood and Pease (2009) have studied factors shaping community attitudes to violence against women (domestic violence, sexual assault, and sexual harassment). They have highlighted the influence of attitudes regarding violent behaviour perpetrated by men against women, naming gender roles (traditional gender norms) and culture as major contributors to women's victimization: "attitudes shape both the perpetration of violence against women and the responses to this violence" (Flood & Pease 2009: 125). Attitudes towards violence against women vary considering gender norms, as they have found that a "consistent predictor of attitudes supporting the use of violence against women is attitudes towards gender roles" (128) and the belief that there are specific roles for men and women. They have also pointed to culture, emphasizing the influence of attitudes towards violence against women. Socioeconomic factors as well as race and ethnicity are contributing to the attitudes towards violence against women, varying from one culture to another and from country to country. The understanding of marriage and the role of women in diverse cultures also influences attitudes (Flood & Pease 2009).

Overstreet and Quinn (2013) have explored how intimate partner violence stigma plays a role in reducing help-seeking behaviour. Stigmas operate by treating certain characteristics or experiences as negative defining features of personal identity (Goffman 1963), resulting in strong social norms to distance oneself from those identities. Overstreet and Quinn (2013) have elaborated on the intimate partner violence stigmatization model with specific regard victim-blaming and the recognition of severe physical violence. They have identified sixteen articles that

focus on people who have experienced intimate partner violence and have addressed one of the three components of intimate partner violence stigma identified in the stigmatization model (Overstreet & Quinn 2013). Using three electronic databases to search articles published in 2011, the intimate partner violence stigmatization model takes into consideration anticipated stigma (meaning the concerns about what can happen when others know about an intimate partner violence experience), internalized stigma (when victims believe the experience reveals their true self); and cultural stigmatization (emphasizing how at the societal level, stereotypes may influence the experience of stigmatization) (Overstreet & Quinn 2013). These findings demonstrate the ways that stigma can be internalized by survivors who censor themselves and accept negative beliefs about themselves.

Stark (2007) has developed the notion of the “entrapment enigma” to explain the duration of abuse and make sense of the reality of women staying in abusive relationships. Stark has explained that women stay in abusive relationships because they feel trapped in their situations, and there is evidence of a “disjuncture between what victims and outsiders expect from separation” with the abuser (Stark 2007: 116). He has also opened the discussion on gender norms and the normalization of controlling behaviour by men in society, which renders certain types of violence hidden. Barriers such as isolation and shame act to prevent disclosure and reporting.

### **3. Barriers to Seeking Help from Police**

Since the early 1980s, some jurisdictions have made changes to facilitate the reporting of intimate partner violence, including introducing mandatory charging policies and otherwise criminalizing intimate partner violence (Brown 2002). However, barriers remain. Studies show that while women may feel protected when they call the police (Ursel et al. 2008), subsequent police responses (or non-responses) mean that those women may not call the police again if future

## Understanding Violence in Relationships

incidents occur (Gover et al. 2013). Several studies have described patterns of dismissal by the police, mistaken accusations of the women themselves as perpetrators, revictimization during police response, and the failure to recognize non-physical violence, specifically coercive control.

For example, Leisenring (2011) conducted semi-structured interviews with 40 women in the United States who reported experiences of intimate partner violence to the police. Four main factors that appear to influence a woman's inability to show their victimization are 1) failing to leave an abusive relationship; 2) admitting to using violence or damaging property themselves; 3) unsuccessfully managing emotion; and 4) failing to describe or define the situation in their own favour. As a consequence of not convincing the police of their victimization, some women were themselves arrested, while in other cases, no police action was taken at all (Leisenring 2011).

Such findings continue to be supported in recent Canadian research. Aspinall (2021) has confirmed that arrested women participating in court-mandated treatment as abusers frequently disclose to program staff that their use of violence was retaliation for or defence against their own victimization that went unrecognized by police. Additionally, in some cases, a manipulative partner made the initial call to police to portray the victim as the problematic party and thereby control the narrative. Extensive research by Sheehy (2014) on 141 women who killed their abusive partners between 1990 to 2005 has also shown how narratives from others (including family, friends, police) portray the women as the abusers. This is illustrated in the case of Donelda Kay, who agreed with the police version that she was angry and stabbed her partner (Sheehy 2014: 167). Analyzing 208 cases of women who were court-ordered to participate in an intervention program after assaulting their partner, Larance and Miller (2017) have found that “more than 75% of the women identified survivorship histories that involved their current or past partner” (1545).

Grace (2019) has explained that with mandatory charging policies, police have the obligation to lay charges when responding to incidents of intimate partner violence, and they must identify the primary or dominant aggressor. Research revealed that women who were charged were “in physically and emotionally abusive relationships, and some even had visible injuries on their bodies at the time of police intervention” (Grace 2019: 183). Defensive wounds such as scratching or biting tend to surface immediately, and an abused female may be arrested for intimate partner violence alongside her partner if police misinterpret her defensive violence as that of a mutual aggressor (Miller & Iovanni 2007).

Dichter and Gelles (2012), who surveyed 164 women about their perceptions of safety and risk after police response for intimate partner violence, have articulated the need to “identify the form, context, and meaning of the violence from the victim’s perspective in order to match women with effective interventions” (59). This statement underscores the fact that there are manifestations of violence that may not be understood as such. Such research points to the reality that formal support (police response) often fails to protect women and may even “exacerbate her risk by removing a deterrent; if the partner learns or perceived that he will not be held accountable, he may be more likely to proceed with violence than if he thought he would be subject to formal sanction” (Dichter & Gelles 2012: 59).

Wolf et al. (2003) conducted five focus groups with culturally diverse groups of women who obtained social services as victims of intimate partner violence in one US city, including 40% (123) who reported previous contact with police. The barriers women faced in contacting the police were grouped into three themes: “victim’s situational and personal factors; victim’s fears and past negative experiences with police response; and victim’s fears of possible repercussions” (Wolf et al. 2003: 123). Fear and negative experiences with police response (the perpetrator in question was

## Understanding Violence in Relationships

not arrested and/or the victim was mistakenly considered the perpetrator) and fear of retaliation (from the perpetrator after the police intervention) were important factors in not reporting.

Similarly, Gover et al. (2013) conducted a qualitative analysis of the accounts of 102 women who had previously engaged with the criminal justice system. Among the reasons they gave for not contacting the police were: dissatisfaction with the criminal justice system (a negative impression of the police); not being taken seriously (disbelief over their description of events); potential negative consequences for themselves and/or their children; love and desire to protect the offender; and fear of the offender. Such research highlights the way that past experiences with the criminal justice system can negatively influence women's decisions to contact police again: "survivors who once engaged the system may have felt revictimized during the process of reporting the crime to law enforcement" (Gover et al. 2013: 113).

Wiener (2017) conducted interviews and focus groups with survivors, police, and independent criminal justice domestic violence advisors, specifically focusing on the issue of coercive control. The findings demonstrate the difficulty in recognizing patterns of violence, as there may be episodes of violence but "the fear it engenders is not [apparent]" (Wiener 2017: 504). When asked to respond in situations where fear is present, police officers often do not have the resources or skills to assess a pattern of violence. Wydall and Zerk (2021) have also explored victim experiences in seeking protection from law enforcement. Conducting several interviews with fourteen survivors over a four-month period, they sought to understand the impact of coercive control on help-seeking. They found that the primary reason the participants reached out to the police was because they felt unsafe to remain in their relationships. Women highlighted the level of control their partners had on their ability to make decisions in seeking help and how they were able to present the circumstances of their situations. Wydall and Zerk found that the behaviour of

women was routinely in question, especially “if they changed their course of action, they perceived that the police, in particular, were sometimes impatient, coercive and even aggressive” if the women were not cooperative (2021: 623). Likewise, Duhaney (2021) has examined the experiences of Black women arrested for intimate partner violence in Canada and found that “the women did not believe that police understood them as victims” (16), as they were not considered to “fit within the stereotypical images of femininity” (10).

This clearly shows how the perception of behaviour can influence professional response and how, as described earlier, victims may not be seen as “true” victims when their reactions to situations do not conform to expectations.

#### **V. Law Enforcement Involvement in the Issue of Intimate Partner Violence**

Intimate partner violence comes to the attention of the criminal justice system through law enforcement, especially through calls to police agencies. Police officers responding to domestic dispute calls thus have a very important role in determining if a situation constitutes intimate partner violence and if it is criminal behaviour. Current police policies or protocols on intimate partner violence restrain police conduct, i.e., police cannot arrest someone where there are no reasonable and probable grounds to believe an offence has been committed (i.e., without evidence). This does not prevent police officers from exercising discretion in their decision to arrest and/or charge someone. The amount of discretion police officers exercise in their role is constrained by policies guiding proper response. Mandatory charging policies are a good example of limits on police officers’ discretion, as such policies mean that officers have an obligation to arrest if presented with evidence that an assault has occurred. Even when police officers are not able to make an arrest or lay charges due to lack of presented evidence, it remains important for them to understand the signs of coercive control and the potential escalation of risk. Failing to do so results

## Understanding Violence in Relationships

in missed opportunities to follow-up with the victim and/or perpetrator as well as to make appropriate referrals to community and social services.

To assess an IPV situation, police officers in Canada use various instruments (assessment tools, checklists, etc.), combined with the offences listed in the Criminal Code. These instruments help counteract personal judgment and perceptions in the exercise of police officers' work. Nevertheless, police officers' perceptions of intimate partner violence influence their use of risk assessment tools as well as their decisions to make arrests (or not) when facing situations involving intimate partner violence.

The importance of stereotypes and myths that fuel perceptions of intimate partner violence cannot be overlooked. They influence the way professionals consider victims and abusers. Myths surrounding intimate partner violence are false beliefs supporting violence as normal, justified, or minimized. Intimate partner violence myths emphasize blaming the victim to the effect that professionals undermine the gravity of women's experiences (Fleming & Franklin 2021). Police officers are not exempt from the influence and impact of myths and stereotypes shaping their attitude and perceptions in responding to intimate partner violence situations. Lockwood and Prohaska (2015) have shown that "[...] officers who held traditional views of women's roles or approved of marital violence were less likely to arrest the offender or to provide crisis counselling to victims" (80). This implies that gender stereotypes, as well as the roles and expectations of men and women, continue to be at play.

This section examines police officers' perceptions of intimate partner violence and the assessment tools available to them when evaluating potential cases of intimate partner violence.

### **1. Police Officers' Perceptions of Intimate Partner Violence**

The following discussion focuses on police understandings, attitudes, and perceptions of intimate partner violence, including coercive control. This includes an examination of police perceptions of physical and non-physical violence in the context of intimate partner violence. Police officers' understanding of the complexity of intimate partner violence itself likely influences their actions and their use of discretion when responding to calls for service (Gill et al. 2021; Myhill & Johnson 2016; Perez Trujillo & Ross 2008). To efficiently assess intimate partner violence situations police officers must understand dynamics and patterns of violence so that they can recognize a potentially harmful situation. The wealth of research available on police perceptions regarding intimate partner violence point to the fact that police response is necessary if the situation is serious. Defining what is to be considered serious in policing intimate partner violence is intimately connected to the circumstances, level of physicality of the violence, and the victim's behaviours (DeJong et al. 2008; Gill et al. 2021; Gover et al. 2011; Lockwood & Prohaska 2015; Myhill 2019; Perez Trujillo & Ross 2008; Robinson et al. 2018). Police officer perspectives of what is appropriate behaviour between intimate partners can lead to misunderstanding the dynamics at play.

Research shows that police officers have diverse perceptions of intimate partner violence and respond according to their understanding of the issue (DeJong et al. 2008; Gover et al. 2011; Gill et al. 2021; McPhedran et al. 2017). Examining police officers' views of intimate partner violence, for example, DeJong et al. (2008) found two perceptibly different views among police officers that they have categorized as either "problematic" or "progressive" (683).<sup>3</sup> The researchers identified various themes within police officers' problematic views, including "simplification of

---

<sup>3</sup> Analysis was based on narratives from police ride-alongs and individual interviews.

## Understanding Violence in Relationships

intimate partner violence, victim blaming, patriarchal attitudes toward women and presumption of victim non-cooperation” (DeJong et al. 2008: 688). Alternatively, progressive views of the issue among police officers were related to the recognition of the complexity and seriousness of the issue, the understanding of barriers to leaving faced by victims, and recognition of the importance of police intervention.

Similarly, Gill et al. (2021) have examined how conventional and progressive views, as expressed in a survey completed by 169 police officers in New Brunswick, influence their attitudes towards the issue of intimate partner violence. Analysis showed that “the majority of police officers (N=90, 58.6%) adopted a conventional view of IPV that was based on naming different forms of violence using terms from the Criminal Code of Canada” (Gill et al. 2021: 27). Intimate partner violence is not assessed as a pattern occurring over time, leading officers to believe that there is no violence if, e.g., there is no injury present at the time. In comparison, police officers holding progressive views of intimate partner violence can identify a pattern of violence over time and see the difficulties for victims to leave or escape an abusive relationship (Gill et al. 2021: 14).

Because the criminal justice system has set standards for what constitutes a criminal offence of intimate partner violence (mainly assault and threat of assault, for instance), it is difficult to recognize violent behaviours. Stark and Hester (2019) have shown that many women return repeatedly to the criminal justice system as victims, but their situations are not “sufficiently grave or injurious to merit a serious crime charge or conviction under the existing approach” (84). These cases fall off the radar and are largely untracked by the criminal justice system.

Eigenberg et al. (2012) have argued that presuppositions about intimate partner violence should be re-examined to ensure better training for police officers. They have emphasized the fact that police officers perceive intimate partner violence as being limited to one kind of violence (i.e.,

physical) or otherwise being a minor issue (e.g., when it is non-physical). Consequently, “there is an implicit, and sometimes explicit, belief by many reform advocates and law enforcement officers that domestic violence should be treated the same as any other crime” (Eigenberg et al. 2012: 131). As discussed above, however, intimate partner violence involves perpetrators who know the victims very well and who exhibit controlling behaviours over time. The immediate incidents that police officers are generally called upon to respond to can be preceded by a history of power and control perpetrated against the victims and are not often presented in the same manner as other crimes committed against a person.

Highlighting that intimate partner violence differs from other crimes, Peterson and Bialo-Padin (2012) have emphasized the importance of collecting evidence. Generally, when at a scene, police officers will look for evidence of physical violence, injuries, or some form of damage to property resulting from an incident in order to arrest and lay charges. After examining “domestic violence cases based on prosecutorial experience in Brooklyn, New York” (2012: 103), Peterson and Bialo-Padin identified what kind of evidence is considered most valuable in domestic violence cases, highlighting the fact that police officers:

are often entering volatile and emotionally charged situations that are potentially dangerous for both the victims and the officers. If a victim lashes out at law enforcement, if she doesn’t want her abuser arrested, it is easy to understand how police may become disengaged or may emotionally distance themselves from the situation: if the victim doesn’t seem to care what happens to her, why should the officer (Peterson & Bialo-Padin 2012: 116–17)?

Recognizing that most victims do not want to testify against their abuser, spending time collecting every possible sign of a violent situation is necessary. Peterson and Bialo-Padin (2012) have therefore advocated for better training of police officers to “address how various types of evidence can be used to build a case and explain the need for special types of corroborative evidence” (117).

## Understanding Violence in Relationships

Robinson et al. (2016) have provided further confirmation that police officers are more prone to intervene in cases of intimate partner violence if there is evidence of physical violence. In a survey of 473 officers in the United States and 260 officers in the United Kingdom, they found that even when police have a good understanding of intimate partner violence, the presence of violence “influences their perceptions of the suitability and utility of various policing tactics” (205). Myhill’s (2019) study with 32 frontline police officers in the United Kingdom likewise found that intimate partner violence incidents involving physical violence were regarded as serious, and the officers were “more likely to arrest the perpetrator” (60). Findings from a survey by Gover et al. (2011) of 309 police officers in large urban agency in a western US state have illustrated that police officers misunderstand the dynamics at play in intimate partner violence situations and consider that they are mainly “verbal family arguments” (632) that do not require police intervention. This is not without concern, since the focus on a specific incident does not allow a thorough assessment of the context in which the event occurred. It does not account for a potentially escalating pattern of violence, the complexity of relationships, nor the barriers that might prevent victims from leaving their abusive partners (DeJong et al. 2008; Gill et al. 2021).

Several researchers (Gill et al. 2021; McPhedron et al., 2017; Ward-Lasher et al. 2017) have also found that some police officers believe that women commit violence against their partners at an equal rate to men, even though national statistics in Canada indicate that 79% of victims of intimate partner violence are female (Conroy 2021a: 29). Police officers also often hold the belief that remaining in an abusive relationship is more dangerous than leaving (Gill et al. 2021), while research shows that leaving increases the level of danger for the victim (Monckton Smith 2021).

Other studies have also demonstrated that police officers' perceptions of intimate partner violence are influenced by the victim's behaviour at the scene, the victim's reaction to violence experienced, and the empathy towards the victim (Gracia et al. 2011; Perez Trujillo & Ross 2008). Police officers' perceptions regarding intimate partner violence are also shaped by their understanding of their role in law enforcement more generally (Balenovich et al. 2008). What emerges from the research regarding police officers' perceptions is the lack of broader vision of what constitutes intimate partner violence. Robinson et al. (2018) have highlighted the importance of considering the context of a relationship and the incident of violence that took place to make a decision. In the context of the criminal justice system, this requires reframing police responses considering patterns of violence that takes place over time, beyond a single incident. As Stark (2012) has noted, "Putting the abusive incident in its historical context changes how police respond to victims" (214). The implementation of the coercive control offence in England and Wales therefore reframes the "[police's] typical approach from responding and taking stock of crime 'incidents' as isolated events towards looking to a series of interrelated events and the harm that follows from these" (Barlow et al. 2019: 4).

Policing coercive control thus involves a drastic shift in the way a situation is approached and assessed, as it becomes about "seeing what is invisible in plain sight" (Wiener 2017: 500). As defined earlier, coercive control refers to various tactics to monitor and micro-regulate by denying rights and resources to the victim. It is not easy to recognize these tactics from an incident-based approach, as they occur over time and are less perceptible than physical violence. In seeking evidence of only physical violence at a scene, officers may assess the situation as low risk if controlling behaviours are not recognized as being harmful to the victim (Wiener 2017; Crossman et al. 2016; Bishop & Bettinson 2018). Research points out that evidence of physical violence

## Understanding Violence in Relationships

alone may not necessarily indicate a pattern of violence in a relationship (Dutton & Goodman 2005; Johnson 2008).

A lack of understanding of a pattern of coercive control during the initial police response may set the tone for intervention availability. If physical violence is the central focal point of intervention, police officers can make the wrong call: “If they get it wrong at that first point of contact then you’re sending the wrong resource or you’re not sending another resource at all, you’re not correctly identifying the risk, whether that’s risk to the victim or to children” (Brennan et al., 2019: 647). To address behaviours of coercive control, police must spend additional time asking further questions that may allow them to document more broadly what they encounter at the scene, resulting in more information about the context of a situation.

## **2. Lethality Risk and Domestic Violence Death Review Committees (DVDRCs)**

Within Canada, a number of provinces have established Domestic Violence Death Review Committees (DVDRCs), whose objectives include the identification of known risk factors in closed cases of homicide in intimate relationships to better inform current and future risk assessments and reduce missed opportunities for intervention (Campbell et al. 2016). Ontario, the first province to establish such a committee in 2002 (Campbell et al. 2016), developed a list of 40 risk factors that has since been adopted for use in other jurisdictions, including New Brunswick. The risk factors are all considered to be weighted equally; however, it is recognized that some, such as strangulation, are likely a stronger predictor of risk of homicide compared to others (Office of the Chief Coroner 2019). Reviewing cases in retrospect allows for the identification of risk factors that are recognized as “red flags” and require a response. It is often found that family and friends but also police and other social service agencies knew of problems in a relationship yet did not know how to respond or missed an opportunity to intervene (Campbell et al. 2016). For police

officers, these interventions may not necessarily be arrest; however, recognition of multiple risk factors could promote safety planning and designations of high-risk that are offered earlier support (Office of the Chief Coroner 2019).

A review of 183 IPV-related deaths in Ontario that occurred between 2002 and 2012 determined a high prevalence of a select few factors. First and foremost, incidents of domestic homicide continued the pattern of being a highly gendered occurrence, with this sample determining that 92% of victims were female, and 91% of perpetrators were male (Dawson & Piscitelli 2021: 785). The most common risk factor was a recorded history of the perpetrator's prior acts of domestic violence, which was found in 73% of all cases, followed closely by an actual or pending separation of the relationship at the time of the homicide, which was found in 70% of cases (Dawson & Piscitelli 2021: 785). Additional factors concerned the presence of obsessive behaviours on the part of perpetrators (54%), perpetrators suffering from depression (50%), prior threats or attempts at suicide from perpetrators (49%), an escalation of violence prior to the homicide (48%), a sense of fear on the part of victims (45%), prior threats to kill the victims (43%), perpetrators being currently unemployed (40%), and previous attempts to isolate the victim (39%) (Dawson & Piscitelli 2021: 785).

An annual report from the Ontario DVDRC summarized additional cases leading up to 2018, finding a continued prevalence of these risk factors (Office of the Chief Coroner 2019). An addition of "victim vulnerability" was added to the list, which includes considerations of the victim's mental health or addiction issues, disability, language and/or cultural barriers, economic dependence, and residence in a rural or remote location. Since its addition, this factor was subsequently located in 43% of domestic homicide cases reviewed since 2017 (Office of the Chief Coroner 2019).

## Understanding Violence in Relationships

A review of domestic homicides in New Brunswick between 2009 and 2018 yielded results that are comparable to the ones established in Ontario. An escalation of violence and a known history of intimate partner violence by the perpetrator were present in 68% of New Brunswick cases, with a pending or actual separation of the relationship and displays of obsessive behaviour following closely at 63% (Gill & Aspinall 2021). Lastly, a CBC News investigation regarding intimate partner homicides across Canada between January 2015 and June 2020 discovered that a recent separation played a role in 22% of cases of domestic homicide, followed closely by previous reports made to police (15.4%) and evidence of coercive control (15.2%) (CBC 2021).

### **3. Formal IPV Risk Assessment Tools**

In instances when there are reports or suspicions of intimate partner violence, many professionals working in the field, including police, have access to risk assessment tools to help evaluate their cases. Development and prevalence of such instruments are various, but such tools generally fall into three categories: unstructured, actuarial, or structured professional judgement. Unstructured formats are based solely on professional discretion and “gut instinct” with no formal guidelines (see Kropp & Hart 2004; Nicholls et al. 2013). While widely used, such unstructured risk assessment is problematic as results can be swayed by personal bias, lack of understanding, or information gaps (Kebbell 2019). Alternatively, actuarial tools require evaluators to focus strictly on predetermined categories of risk and exclude additional or context-specific considerations (see Kebbell 2019; Kropp & Hart 2004; Nicholls et al. 2013). Bridging the gap between the two, structured professional judgement approaches encourage evaluators to follow specific guidelines but allow for their own decisions and interpretations of risk (Kebbell 2019; Kropp & Hart 2004; Nicholls et al. 2013).

Within Canada, the Danger Assessment (DA), Ontario Domestic Assault Risk Assessment (ODARA), Spousal Assault Risk Assessment (SARA), and Brief Spousal Assault Form for the Evaluation of Risk (B-SAFER) are among the IPV risk assessment tools most used by a variety of frontline service providers. These instruments span the categories of risk assessment approaches identified above. The DA was designed to predict a likelihood of lethality (Campbell 2004; Connor-Smith et al. 2011; Jung & Buro 2017) by asking the victims to report the number of abusive incidents over the past year and respond “yes/no” to risk factors specifically associated with homicide (Campbell et al. 2009). In its original form, the DA is frequently used by shelter staff, victim services, and child protection services across Canada (Canales et al. 2013). A shortened version specifically for law enforcement, the DA-LE, includes eleven factors asking specifically about separation, control, threats and previous attempts to kill, threats or use of weapons, presence of firearms, strangulation, victim’s fear, frequency and severity of abuse, and perpetrator threats or attempts of suicide (Messing & Campbell 2016). However, even though the original DA has been adopted by many frontline service providers, this condensed version does not appear to be implemented amongst Canadian police agencies and is instead found primarily in the United States (Messing & Campbell 2016).

When intimate partner violence is reported, the police are often the first point of contact and, as a result, are frequently responsible for assessing risks presented by the perpetrators, which may also include managing the vulnerabilities of the victim and determining when to refer to and collaborate with additional community services (Belfrage et al. 2012). Hilton et al. (2004) have concluded that police officers are in a good position to quickly assess intimate partner violence scenarios as they often speak directly to victims about their relationships and about their current situation and have ready access to criminal history information. As many police agencies work

## Understanding Violence in Relationships

with limited resources, risk assessment tools can help to ensure perpetrator risk and victim safety are responded to and managed with appropriate resources (Almond et al. 2017). Therefore, the abovementioned ODARA, SARA, and B-SAFER are frequently used by Canadian police officers. These assessment tools are predictive, aiming to assess future risk of assault (Millar et al. 2013). Risk assessments are considered relevant during a number of stages within the criminal justice system process, such as at the point of arrest, and when making decisions around sentencing and release (Kropp & Hart 2004). For frontline police officers, these risk assessment tools are often utilized on-scene or during the early investigation process to assist in determining arrest decisions, as well as identifying which cases would benefit from further referral and follow-up. Kebbell (2019) has observed that it is common for police officers to have access to and be trained in utilizing risk assessments. However, it is difficult to summarize national training practices for police officers, as even though the validated tools mentioned above are widespread, police agencies continue to consider and pilot additional assessment methods such as investigative checklists and protocols designed by their individual agencies that may also require their own internal training (Millar et al. 2013).

The ODARA, an actuarial tool specifically developed for police, contains thirteen items aimed at predicting a perpetrator's risk of reoffending (Hilton et al. 2004; Jung & Buro 2017; Millar et al. 2013; Nicholls et al. 2013). Factors assessed include prior intimate partner violence and non-intimate partner violence, prior custodial sentences, breach of release conditions, threats to kill, confinement, victim's fear, number of biological/stepchildren, assault on the victim while pregnant, and barriers to the victim accessing support (Kebbell 2019). The ODARA has been adopted for use by police agencies in Ontario, New Brunswick, and Nova Scotia (Millar et al. 2013). Research conducted in New Brunswick with a random selection of 142 police files has

revealed that when the ODARA was administered, a police officer was more likely to make an arrest and recommend charges to the prosecutor compared with files in which it was not used (Ballucci et al. 2020). In Nova Scotia, if the overall score is seven or above, the case is then designated for case management under Nova Scotia's High Risk Case Coordination Protocol, and information is shared with other service providers with the intent to be able to intervene quickly, provide resources and support, and create a safety plan with the individuals involved (Department of Justice 2013).

As a structured professional judgement tool, the SARA requests assessors to utilize a victim interview, standardized measurements of psychological and emotional abuse, and criminal record history to evaluate intimate partner violence and criminal history as well as psychological and social functioning of the perpetrator (Jung & Buro 2017). While still used by police officers in various jurisdictions throughout Ontario, Alberta, British Columbia, and the Yukon (Millar et al. 2013), its reliance on judgements of mental health means that police officers generally do not have the required training to employ the SARA effectively (Kebbell 2019; Kropp & Hart 2004; Nicholls et al. 2013). In response to such challenges, the B-SAFER was developed in 2005, specifically for police officers as a condensed and revised version of the SARA that does not require a thorough assessment of mental health (Jung & Buro 2017; Nicholls et al. 2013). Like other tools, the B-SAFER process considers issues such as physical or sexual violence, escalation of violence, threats, breach of orders, non-intimate partner violence related criminal behaviour, unemployment and financial difficulties, substance use, and mental health diagnoses (Kebbell 2019; Millar et al. 2013).

#### **4. Limitations to Current Police Risk Assessment Processes**

There is increasing information about coercive control and other non-physical tactics of abuse, yet commonly used risk assessment tools continue to emphasize the presence or history of physical violence. The SARA and B-SAFER concentrate on the presence of actual or threatened physical harm (Kropp & Hart 2004). The ODARA requires “evidence in the police report of physical contact with the victim or a credible threat of death with a weapon in hand in the presence of the victim” in order to use the tool (Mental Health Centre Penetanguishene 2005: 11).

The focus on physical abuse downplays other aspects of intimate partner violence that may be influenced by gender, ethnicity, disability, and other social and structural factors (Barlow & Walklate 2021). When asked what issues women considered most important regarding their risk of future harm, they responded with factors such as emotional abuse and controlling behaviours, jealousy, and untreated mental health issues (Connor-Smith et al. 2011). Campbell (2004) has also argued that more consideration should be given to a woman’s own perception of harm and level of fear. While “victim fear” is identified in a number of risk assessment tools, it is not usually a principal category leading to high risk. Moreover, current risk instruments do not provide sufficient questions to gather information about coercive control, or do not encourage police officers to ask further questions to understand more about the context of relationships (Medina Ariza et al. 2016). As a result, if a perpetrator primarily concentrates on using tactics of coercive control against his partner, there can be little to no record of physical violence. Even after having contact with the criminal justice system, women have been killed after their risk was assessed incorrectly or inappropriately (Barlow & Walklate 2021; Myhill & Hohl 2016).

Not every risk assessment instrument has been developed for the same purpose, yet they continue to be used in a similar manner across jurisdictions. For example, the DA (and subsequent DA-LE) was intended to assess lethality, whereas the ODARA was intended to predict re-assault

rather than homicide (Campbell et al. 2009). The SARA was originally aimed at identifying both but has been evaluated only against repeated assaults (Campbell et al. 2009). Campbell (2004) has pointed out that, overlap between these issues notwithstanding, risk of revictimization, risk of lethality, and determination of factors that may help to keep victims safer all include different considerations.

Lastly, risk assessment tools have largely been validated only for male perpetrators who abuse their female intimate partners. For example, the ODARA is not validated for use with female perpetrators (Ballucci et al. 2020), and cultural differences are also not accounted for. While primarily used with male perpetrators, further research is necessary to determine if similar risk factors within assessment tools are applicable for Indigenous men (Peters et al. 2018). Considerations are also recommended to incorporate storytelling and narrative approaches to future risk assessment structures when administering with Indigenous populations (Peters et al. 2018).

### **5. Coercive Control Assessment**

The United Kingdom adopted a risk assessment tool in 2009 that aimed to capture the presence of coercive control. The Domestic Abuse, Stalking and Honour-Based Violence Risk Identification and Management Model (DASH) is a structured professional judgement tool now used by almost all police agencies in England and Wales (Barlow & Walklate 2021; Kebbell 2019; Turner et al. 2019). Longer than many other risk assessment tools in circulation (at 27 items), it captures seven elements specifically referencing coercive control behaviours: isolation, control, excessive jealousy, threats to kill the victim and/or children, threats to commit suicide, and persistent texting phoning, harassing, or stalking (Myhill & Hohl 2016). As well as identifying the presence of such

## Understanding Violence in Relationships

behaviour, police officers are also expected to note any further contextual information or perceptions of relevant situations (Myhill & Hohl 2016).

DASH has been subject to some noted discrepancies regarding if and to what degree professional judgements should be incorporated, as well as to questions regarding the relative weighting of risk factors (Almond et al. 2017). There are also variations in what overall score results in a designation of high risk, though Turner et al. (2019) have reported a general threshold score of fourteen. Ultimately, decisions made from the DASH scoring criteria have helped to determine the degree of subsequent intervention and referrals made to support services for victims (Turner et al. 2019).

A revised tool was also recently piloted amongst three police forces in the United Kingdom after evaluations of the DASH found inconsistencies in the designation of risk (Wire & Myhill 2018). The new tool, now known as the Domestic Abuse Risk Assessment (DARA), reduces the total number of questions asked, changes yes/no responses into scales from “never” to “all the time,” and provides only one free text response box at the conclusion for police officers to summarize their opinions (Wire & Myhill 2018). Responses by police officers have generally been positive, reporting that they felt the revised model helps them understand further the context of the relationships in question and more easily identify the presence of coercive control (Wire & Myhill 2018).

However, similar to earlier findings with the evaluations of the DASH, even when police officers consider coercive control to be high-risk, arrest is less likely to occur if it is not also accompanied by physical violence (Barlow & Walklate 2021; Wire & Myhill 2018). Without the presence of physical abuse, police still tend to conclude that there is no immediate risk to the victim’s safety that requires intervention (Barlow & Walklate 2021). This suggests that even with

guiding questions about coercive control, a lack of personal understanding or stereotypical beliefs held by individual police officers can still impact their decision-making about intervention (Spivak et al. 2021; Turner et al. 2019). It remains necessary for police officers to learn in depth how intimate partner violence works and how a variety of risk factors and contexts can interact to produce different levels of risk at different points in time (Spivak et al. 2021).

Are risk assessment instruments helping police officers address the volatile complexity of intimate partner violence? It seems that knowledge acquired to date is not enough to adequately respond to the issue. Police officers continue to exercise considerable discretion in their decisions to intervene (or not), and while formal risk assessment tools are beginning to guide frontline decision-making, several researchers have demonstrated that police officers still often minimize the issue of coercive control, instead focusing attention on evidence of physical assault. The lack of recognition of patterns of violence involving coercive control leads police officers to respond to intimate partner violence situations solely within the parameters of existing laws and regulations, which likewise largely remain centered around discrete incidents of physical violence or threatened violence.

## **VI. Conclusion**

This report has highlighted the complexity of intimate partner violence. There is not a straightforward explanation of its occurrence, as we need to take into consideration the context in which it occurs, the motive behind the use of violence, the pattern of violence in place, and the impact over time on victims to adequately understand its magnitude and pervasiveness in Canada. Intimate partner violence must also be distinguished from other important and often overlapping issues, including gender-based, family, and domestic violence. The definitional nuances of

Understanding Violence in Relationships

intimate partner violence in particular make clear that the concept of coercive control is central to understanding patterns of violence in intimate relationships.

Coercive control is insidious and remains widely misunderstood in Canada. Knowledge about the tactics and impact on victims helps explain why so many victims have difficulty leaving or frequently return to abusive partners. Understanding intimate partner violence as a pattern of behaviour over time has a real impact on the potential for criminal justice responses. We have demonstrated how police officers are often encouraged to handle intimate partner violence situations as one incident at a time. Though physical violence is recognized as serious and criminal, when police officers are called to a scene, they often do not consider the wider context that precipitated the immediate incident and thus fail to address harm when making decisions about intervention. This report has elaborated on the current difficulties in addressing intimate partner violence from a criminal justice perspective. Police agencies will be able to improve their strategies for and records on intervention only by recognizing and addressing coercive control as a serious issue.

## **I. Introduction**

Discretion is central to policing in Canada. Every day, the police make thousands of decisions that affect the lives of Canadians across the country, determining when the law should (or should not) be enforced, how public complaints and crimes are investigated, and what happens to those suspected of breaking the law. In many cases, these decisions are made by police officers in direct contact with members of the public and play a crucial role in shaping the relationship between those individuals and the state. While public officials in many capacities have discretion to make decisions in the ordinary course of their work, the decisions made by police officers are underpinned by their unique ability to use force in the execution of their duties, accompanied by extensive powers with respect to arrest, detention, search and seizure, and the gathering of evidence.

This report aims to shed light on several key aspects of police discretion and decision-making, beginning with the fundamental issue of the relationship between discretion, law, and the legal duties of the police. The report is not a comprehensive overview of the extensive literature on police discretion in Canada and elsewhere but instead looks to provide a foundation for broader discussions about the scope of police discretion, the factors that influence its exercise, and whether it needs to be subject to more extensive and effective limitations. Fundamentally, the report considers whether the role of the police as a public institution and the demands placed on police officers as individuals are compatible with the notion of discretion as traditionally conceived. Given the many challenges facing the police in Canada today, there is a pressing need for a serious and structured discussion about the nature and scope of their discretion and whether it should continue to be regarded as an inescapable aspect of modern policing.

## Understanding Police Discretion

This report is divided into four substantive sections. The first focuses on the challenges of defining police discretion and presents two contrasting accounts of discretion from the literature on policing: one that regards officer discretion as a freedom arising from the absence of effective limits on police authority; and another that views that same discretion as a form of privilege or resource granted to the police. Defining police discretion is central to this report for two reasons. First, it is a necessary precondition to engaging in wide-ranging and principled discussions about how discretion does and, more importantly, should operate. Where police discretion derives from and its relationship to law are fundamentally connected to questions of oversight and regulation. This leads to the second reason that defining police discretion is so important: doing so forces us to think carefully about the function of the police in Canadian society – in particular whether officer discretion is an inevitable consequence of the way in which contemporary forms of policing are currently structured. Being upfront about the normative conceptualizations of discretion thus allows for more clear-sighted consideration of police reform more broadly.

Building on the discussion in section II, section III examines the relationship between police discretion and police duties in Canada, arguing that regardless of whether we view police discretion as a freedom or a privilege, it remains the case that this discretion must be exercised in accordance with various established statutory and common law duties. Here, the aim is to draw attention to the fact that police discretion – even when exercised in low-visibility environments and free from substantial and effective oversight – is nonetheless bounded by our understanding of the policing function and the duties that derive from it. This section also considers the way in which these duties have evolved in Canada, particularly since the introduction of the *Charter of Rights and Freedoms* and, as will be discussed, a growing willingness on the part of courts to allow private law actions in negligence against the police.

Section IV provides an overview of the research literature on the use of police discretion and, with it, a typology of the different factors that influence the exercise of that discretion. After a brief examination of the key characteristics of police institutions and the organizational settings in which discretion operates – frequently referred to as “low policing” and “high policing”<sup>1</sup> – the section goes on to discuss how the character and attitudes of officers, suspects, and victims of crime can influence the exercise of discretion. The section then considers how these situational factors interact with other variables that determine the use of discretion, including the nature and location of the offence and the type of police service involved.

The final section of the report returns to the challenges associated with reforming police discretion and argues that there is a pressing need for legislatures at the provincial and federal levels to provide a clear legal basis for the exercise of that discretion – along with a coherent set of statutory rules that govern and limit its use. The report then concludes by highlighting the lack of independent research on police discretion and calls for greater engagement on the part of police services at all levels with academic lawyers, sociologists, criminologists, and police scholars in Canada.

## II. Defining Police Discretion

There are many competing definitions of discretion in law. Common to almost all of them, however, is an emphasis on the opportunities created by rules for individual judgment and the exercise of authority. For Westen, discretion is the “area within which the discretion-holder has the authority to adopt, or not adopt, whatever rule he [sic] deems fit.”<sup>2</sup> For Galligan, it is “a

## Understanding Police Discretion

sphere of autonomy within which one's decisions are in some degree a matter of personal judgment and assessment."<sup>3</sup> For Christie, the essence of discretion lies with "choice in the context of power relationships."<sup>4</sup> These recurring ideas – of discretion as both the ability to choose and the capacity to exercise power – were perhaps best captured by Pratt and Sossin in 2009:

Discretion arises when an official is empowered to exercise public authority and afforded scope to decide how that authority should be exercised in particular circumstances. At root, discretion is about power and judgment.<sup>5</sup>

As Pratt and Sossin went on to note, law and discretion are also inevitably bound together: "more law means less discretion, and less discretion means more law."<sup>6</sup> In other words, as Dworkin once observed, discretion is like the "hole in the donut" – it does not exist except as a space created by law, and its scope is limited by the law that surrounds and produces it.<sup>7</sup>

#### **A. Police Discretion as the Capacity to Choose**

In the context of policing, one of the most influential definitions of discretion can be found in the work of the American legal scholar Kenneth Culp Davis. Writing in the late 1960s, Davis observed that "a public officer has discretion whenever the effective limits of his [sic] power leave him free to make a choice among possible courses of action or inaction."<sup>8</sup> Where that

For a discussion of the influence of Davis' work on police discretion, see Nickels, EL. (2007) "A Note on the Status of Discretion in Police Research" *Journal of Criminal Justice* 35(5): 573–78.

public official is a police officer, this discretion translates into the power to make policy with regards to individuals:

The police are among the most important policy makers of our society, and it is high time that the public should realize this reality. They make more discretionary determinations in individual cases than any other class of administrators; I know of no close second... Although the police constantly make policy, they pretend not to, and they try to keep the public from realizing that they make policy.<sup>9</sup>

It is important to note that Davis was alive to the possibility that his definition of discretion could be seen as overly broad. As such, he also stressed that officials like police officers are often subject to guidelines and policies that set out criteria for the acceptable use of their discretion.<sup>10</sup> The question for Davis, however, was whether such guidelines and policies were sufficient to prevent the misuse of discretion and the very real harms that stem from what he referred to as “discretionary injustice”:

[B]y and large, injustice results far more from exercise of discretionary power than from application of rules. The greatest and most frequent injustice occurs in discretionary action, where rules and principles provide little or no guidance, where emotions of deciding officers may affect what they do, where political or other favoritism may influence decisions, and where the imperfections of human nature are often reflected in the choices made.<sup>11</sup>

This early attempt to define the discretion exercised by public officials like the police was significant because it came at a time of growing academic interest in policing and law enforcement. As Bronitt and Stenning have observed, much of this interest can be traced to the work of several prominent US scholars, most notably the criminologist and legal academic Herman Goldstein.<sup>12</sup> Writing in early 1960s, Goldstein argued that the police – contrary to the

## Understanding Police Discretion

prevailing view at the time<sup>13</sup> – do not in reality pursue policies of “full enforcement.” Instead, they are constantly called on to exercise discretion and make decisions about which laws should be enforced and whose conduct requires their attention.<sup>14</sup> As Goldstein acknowledged at the time, this stems in part from the fact that the police do not have the resources to respond to every violation of the law they encounter. Whether or not the police choose to admit it, the widespread use of discretion is central to the pragmatic execution of their work and the effective functioning of police organizations:

The real choice for a police administrator is not between “full enforcement” and “discretion” but rather more precisely between the ideal and reality... An essential first step [to improving policing] will then be to inform the public, to challenge some of our basic concepts, to take stock of the total responsibilities of the police, to recognize the limitations under which the police operate, and to acknowledge the need for the exercise of discretion. It is then likely that a new atmosphere will be created which will foster some new thinking and some new developments to aid in the improvement of the total system for the administration of criminal justice.<sup>15</sup>

Although Goldstein had significant concerns about the use of police discretion, he also believed that denying its existence was a mistake. Instead, he argued that openly recognizing the central role played by discretion was vital, both to the police’s desire to be seen as professionals and the public’s need to have confidence in them:

The police have sought professional status. But professional status does not normally accrue to individuals performing ministerial functions. One of the marks of a true profession is the inherent need for making value judgments and for exercising discretion based upon professional competence. To deny that discretion is exercised gives support to those citizens who maintain that the job of a police officer is a simple one, that it requires little judgment, and that it is not worthy of professional status. By

<sup>13</sup> See Scott, MS. (2004) “Police Discretion” in LE Sullivan, MS Rosen, DM Schulz, and MR Haberfeld (eds), *Encyclopedia of Law Enforcement*. Thousand Oaks, CA: Sage.

<sup>14</sup> This practice would later be referred to as “selective enforcement.” See: Klockars, CB. (1985) *The Idea of Police*. Beverly Hills: Sage, 93. As Ericson observed in 2007, in Canada, the idea that the police exercise discretion began to be discussed openly only in the 1960s. See Ericson, R.V. (2007) “Rules in Policing: Five Perspectives” *Theoretical Criminology* 11(3): 367–400, 368.

<sup>15</sup> H Goldstein (1963), 148.

## Understanding Police Discretion

acknowledging the discretionary role the police do fulfill, the drive toward a higher degree of respect and recognition for law enforcement personnel is given impetus.<sup>16</sup>

Crucially, Goldstein’s reflections on the impossibility of full enforcement and the inevitability of discretion were published only three years after another important work on police discretion. Appearing in the *Yale Law Journal* in 1960, Joseph Goldstein’s article “Police Discretion Not to Invoke the Criminal Process” contained two key insights into the nature of police discretion that were to become focal points for much of the scholarship on policing that followed.<sup>17</sup> First, Joseph Goldstein noted that a great deal of police discretion is exercised in what he referred to as “low-visibility” environments, such as the street.<sup>18</sup> As a consequence, it is difficult to subject police decision-making to meaningful scrutiny or establish effective systems of oversight. Second, Goldstein drew attention to the fact that police discretion also encompasses the decision *not to act* when faced with an event or situation that might warrant intervention. Non-action on the part of the police can in fact play as much if not more of a role in shaping the character of law enforcement as does direct action.

As significant as these observations about low visibility and action/inaction were at the time, even more important was Joseph Goldstein’s insight that they were inextricably related. Going further, Goldstein noted that the exercise of police discretion not to act is harder to subject to oversight and review than an exercise of police discretion to act, yet it nonetheless has a potentially greater impact on the administration of criminal justice:

Police decisions not to invoke the criminal process largely determine the outer limits of law enforcement. By such decisions, the police define the ambit of discretion throughout

<sup>16</sup> H Goldstein (1963), 148.

<sup>17</sup> Goldstein, J. (1960) “Police Discretion Not to Invoke the Criminal Process: Low-Visibility Decisions in the Administration of Justice” *Yale Law Journal* 69(4): 543–94.

<sup>18</sup> Although the distinction between “low-visibility” and “high-visibility” environments may no longer be as stark as when Goldstein was writing – in part due to the prevalence of public area CCTV and the ubiquity of cellphone cameras – it remains the case that a great deal of routine police work is carried out in environments where there is no direct supervision or possibility of formal oversight.

## Understanding Police Discretion

the process of other decisionmakers-prosecutor, grand and petit jury, judge, probation officer, correction authority, and parole and pardon boards. These police decisions, unlike their decisions to invoke the law, are generally of extremely low visibility and consequently are seldom the subject of review. Yet an opportunity for review and appraisal of non-enforcement decisions is essential to the functioning of the rule of law in our system of criminal justice.<sup>19</sup>

Taken together, the writings of Joseph and Herman Goldstein can be seen as the beginnings of an important shift in the study of policing and police decision-making. By openly rejecting the “myth” of full enforcement and observing that police discretion encompasses inaction as well as action, they played a central role in what Nickels has referred to as the “discovery” of discretion.<sup>20</sup> Their work – and the many critical studies of policing that emerged in the decade that followed – also had a direct influence on efforts to arrive at a definition of police discretion that addressed growing concerns about how discretion operates within the criminal justice system – and in particular how its exercise can lead to the differential treatment of marginalized communities and problems of systemic bias and discrimination. Although some have argued that Davis’ definition of police discretion was intended to be purely descriptive, it is hard not to see his reference to “effective” limits as an acknowledgement of the fact that the exercise of police discretion often takes place outside of the constraints imposed by law. Indeed, Davis explicitly noted that his definition necessarily includes “a good deal of discretion [that is] illegal or of questionable legality.”<sup>21</sup> According to Ericson, researchers who subscribe to the idea of “police discretion-as-deviance” tend to fall into one of two categories: those who see the exercise of such discretion as a benign practice aimed at ensuring legal rules do not “get in the way of efficient criminal investigations and desirable outcomes”; and those who view it as a

form of noble cause corruption, with the police favouring crime control over a commitment to due process.<sup>22</sup>

### **B. Police Discretion as a Privilege and Resource**

Davis' writing on police discretion has proved to be enduring – so much so that the influence of his work is “readily discernible in even the most rudimentary introductions to the subject.”<sup>23</sup> Having said this, helpful alternatives to Davis' definition do exist. According to Kleinig, for example, it is a mistake to describe police discretion as the ability to make decisions in the space created by the absence of legal rules or other restrictions. In Kleinig's view, when police officers act outside the scope of their legal authority – or in ways that are fundamentally at odds with their role and responsibilities – they cannot be said to be using their discretion. An officer who uses excessive and unjustified force against a member of the public is obviously making a decision, but in Kleinig's view, they are not exercising discretion.<sup>24</sup> Building on this observation, Kleinig has argued instead that police discretion is akin to a *permission* or *privilege* to make decisions in certain circumstances:

Police discretion is a normative resource that police possess, one that authorizes them to use their considered judgment in certain ways in certain situations. It may be that they are authorized to determine whether a situation should have their intervention or whether to respond to some demand that is made. In other words, whether or not a particular situation falls within the ambit of their social peacekeeping powers may be a matter of discretion.<sup>25</sup>

As Kleinig himself has noted, this view of discretion stands in direct contrast to the one offered by Davis. Where Davis saw police discretion as a *capacity* – a “decision-making power

## Understanding Police Discretion

that is not completely covered by rules”<sup>26</sup> – Kleinig instead sees a *prerogative*: an authority to “use one’s own judgment about how to make a practical determination.”<sup>27</sup> Importantly, Kleinig has noted that the use of discretion is more acceptable when the person exercising it is seen “as possessing special knowledge and expertise in relation to their sphere of service.”<sup>28</sup> In the case of the police, this raises the question of whether policing is seen and treated as a profession. If it is – and police officers are professionals – then the exercise of police discretion is more likely to be regarded as legitimate: not just by others within the criminal justice system but also by those who are subject to that discretion.<sup>29</sup>

These divergent accounts of police discretion represent two fundamentally different understandings of police action/inaction and ultimately two different conceptualizations of the policing function more generally. Although Davis and Kleinig both recognize that the police have discretion, for one that discretion exists largely because the unsupervised character of police work – and the ineffectiveness of legal and other controls – gives officers the freedom to make choices. For the other, discretion is something that the police are granted in response to their role and in recognition of their expertise. Moreover, the police are expected to exercise this authorized prerogative *with discretion*.<sup>30</sup>

Although work by Davis and Kleinig has helped to frame debates about the nature and scope of police discretion, it remains the case that a widely accepted definition of police discretion has remained elusive. Looking at recent writing on policing in Canada, for example,

---

<sup>26</sup> Kleinig (1996), 83 (referring to Davis). Davis himself did not use the term “capacity” in his account of discretion.

<sup>27</sup> Kleinig (1996), 83.

<sup>28</sup> Kleinig (1996), 83.

<sup>29</sup> Kleinig (1996), 83.

<sup>30</sup> Kleinig (1996), 83.

many discussions of police discretion avoid the issue of definition altogether and move directly to the question of how that discretion is exercised. A notable exception to this approach, however, can be found in Schulenberg's 2015 article on discretion and non-arrest decisions.<sup>31</sup> Although she refers to both Davis' and Kleinig's accounts of police discretion and concedes that the term remains ambiguous, Schulenberg has helpfully explained why this is the case:

Specifically, the problem is that we continue to lack a comprehensive understanding of decisions invoking less police authority and social control than an arrest... [But] to focus on the decision to arrest is overly simplistic for two reasons. First, current mandates emphasize community policing, which by definition involves working with citizens to resolve problems and the use of nonarrest actions to resolve problems. Second, arrests occur less frequently than other dispositional alternatives, providing a strong rationale for developing a better understanding of other types of police authority, such as the decision to request a particular behavioural change.<sup>32</sup>

The point made here is an important one. To be meaningful, any definition of police discretion must reflect the fact that such discretion extends well beyond discrete and quantifiable matters that are directly related to arrest, investigation, and the prosecution of crime. Although it may be going too far to argue – as Moskos has – that “every interaction between the police and the public involves discretion,”<sup>33</sup> Schulenberg is right to suggest that many accounts of police discretion – and accompanying efforts to understand how it is exercised – have been too narrow.

### **C. Why Defining Police Discretion Matters**

It would be a mistake to see disagreements over the definition of police discretion as examples of rarefied academic debates that have little to do with the realities of policing. The question of whether discretion is something that arises out of the necessities of police or instead is a power

---

<sup>31</sup> Schulenberg, J.L. (2015) “Moving beyond Arrest and Reconceptualizing Police Discretion: An Investigation into the Factors Affecting Conversation, Assistance, and Criminal Charges” *Police Quarterly* 18(3): 244–71, 247.

## Understanding Police Discretion

that is expressly granted to the police, is a fundamentally important one. If we take the view that discretion is an inevitable consequence of the realities of policing and the problem of imposing “effective limits” on police officers’ authority, then our key question is most likely to be: what is the best way to ensure that this discretion is used appropriately and effectively? If, however, we regard discretion as a privilege or prerogative given to the police, then our question may be a different one: are there aspects of their work that merit the granting of discretion and, conversely, other aspects that should *not* be subject to discretion?

The issue of definition is particularly important in the Canadian context. Prior to the introduction of the *Charter of Rights and Freedoms*, the prevailing view of police discretion and the approach taken by Canadian courts were very much aligned with Davis’ definition. As Stribopoulos has noted,

Before the *Charter*, gaps in the patchwork of statutory and common law rules relating to police powers were rarely of any practical concern to law enforcement. In circumstances where the legal limits on police authority were unclear, the police had discretion in deciding how to act.<sup>34</sup>

However, by opening the door to constitutional claims in the context of criminal proceedings, the *Charter* has brought with it a greater focus on the nature and extent of police discretion in Canada. Combined with growing public concern over abuses of police power,<sup>35</sup> this has led to a situation in which the courts are now routinely asked to consider whether an exercise of police discretion has violated a suspect’s *Charter* rights, exposing many of the “serious deficiencies in

the scattered collection of statutory and common law rules that make up the law of police powers in Canada.”<sup>36</sup>

Although Stribopoulos has made use of Davis’ definition in his analysis of the Supreme Court’s approach to police powers in light of the *Charter*, in many respects his call for Parliament to better regulate these powers – and provide meaningful safeguards around the use of police discretion – lines up better with Kleinig’s view of police discretion as a privilege. Quoting Davis, Stribopoulos has observed that “[s]ometimes the proper course may be to make legal the illegal official practices that have long been a part of our system,” before going on to note that bringing such practices out into the open is an important first step towards regulating them.<sup>37</sup> This argument is stronger, however, if one starts from the position that discretion is something that is given to the police – a “normative resource” – rather than something that is taken by them. Returning to Kleinig:

[P]olice discretion is not simply a decision-making power that police possess in virtue of the relatively unsupervised nature of their work. It is a normative resource that we grant them or recognize that they have. As such we should expect this authority or prerogative to be grounded in certain justifying considerations.<sup>38</sup>

If the “we” here is the public that the police ultimately exist to serve, then it is for Parliament – and not the courts – to decide on these justifying considerations and lay them out in the sort of comprehensive scheme of legislated police powers and procedures envisaged by Stribopoulos.<sup>39</sup> This approach is also more consistent with the principle of “policing by consent,” which is foundational to the idea of policing in Canada.<sup>40</sup>

## Understanding Police Discretion

As a final point, regardless of whether we favour Davis’ or Kleinig’s definition, it is important not to lose sight of the shared understanding of police discretion that has emerged over the last sixty years. While a definitive, overarching formulation of police discretion has yet to be established in Canada or elsewhere, many common features of police discretion have been identified. These include the fact that discretion tends to be concentrated in the lower levels of police organizations, is routinely exercised by relatively inexperienced officers, and is largely unsupervised.<sup>41</sup> These are all aspects of policing that will be considered in sections IV and V below.

### III. Police Discretion and Police Duties

As has been noted, in the United States the “discovery of police discretion” occurred against the backdrop of a longstanding public commitment – on the part of the police as well as legislators and policy-makers – to the principle of full enforcement.<sup>42</sup> Importantly, however, full enforcement has never been a stated policy or guiding principle in Canada.<sup>43</sup> Because the legal and institutional foundations of policing in Canada are based on Peelian principles developed in the United Kingdom during the-nineteenth century,<sup>44</sup> the role of the police has instead been framed in terms of common law duties, as well as statutory mandates and responsibilities, rather than idealized notions of full enforcement.

---

<sup>42</sup> Ericson (2007), 369.

<sup>43</sup> Schulenberg (2015), 246. See also Carrington, P.J. & Schulenberg, J.L. (2008) “Structuring Police Discretion: The Effect on Referrals to Youth Court” *Criminal Justice Policy Review*, 19(3): 349–67.

<sup>44</sup> Robertson, N. (2012) “Policing: Fundamental Principles in a Canadian Context” *Canadian Public Administration* 55(3): 343–63.

A key question that follows from this is whether these mandates give rise to legally enforceable duties that compel the police to act in particular ways or otherwise limit their discretion. As will be discussed in this section, to date Canadian courts have recognized a number of interrelated duties that can give rise to a private law action in negligence against the police, as well as remedies under the *Charter of Rights and Freedoms*. This stands in contrast to many other jurisdictions such as Australia, New Zealand, and the United Kingdom, where the courts have been far more reluctant to hold the police accountable for harms arising out of the exercise of their discretion.<sup>45</sup> However, as progressive as the Canadian judicial approach may appear, the case law on statutory duties has developed in the absence of a clear legislative foundation or framework for the exercise of police discretion. In this regard, police discretion in Canada appears to fit the Dworkinian model, with the duties established by statute being the “donut” and police discretion being the “hole.” As will be examined more closely in the next section, this approach has resulted in a situation whereby police discretion – at least in terms of its legal meaning– is understood as a set of practices and behaviours that are defined by the limits placed on them (by duties) rather than as emanating from any clear legal foundation.

#### **A. Statutory Duties and the Police**

Policing services in Canada are provided at the federal, provincial, and municipal levels of government, with the duties of the police being set out in a range of federal and provincial statutes. The Royal Canadian Mounted Police, who provide policing services at all three levels, are governed by the RCMP Act.<sup>46</sup> According to sections 18 and 37 of the Act, RCMP officers have duties to preserve the peace, prevent crime, and apprehend criminals, all of which must be

---

<sup>45</sup> Bronitt & Stenning (2011), 326.

<sup>46</sup> Royal Canadian Mounted Police Act, RSC 1985, c. R-10.

## Understanding Police Discretion

performed promptly, impartially, diligently, and with respect for the rights of all persons and the importance of “maintaining the integrity of the law, law enforcement and the administration of justice.”<sup>47</sup> Notably, the word “discretion” – at least as it pertains to police officers – appears only once in the entire Act, and then only in reference to the removal and storage of goods seized under warrant.<sup>48</sup>

Turning to provincial police legislation, there is considerable variation when it comes to statutory descriptions of the role and responsibilities of provincial and municipal police.<sup>49</sup> In some instances, the relevant language is both general and expansive. In British Columbia, for example, section 7(2) of the Police Act 1996 states that the provincial police:

[M]ust perform the duties and functions respecting the preservation of peace, the prevention of crime and offences against the law and the administration of justice assigned to it or generally to peace officers by the commissioner, under the director's standards or under this Act or any other enactment.<sup>50</sup>

In other provinces, however, the legislation is more detailed. Entitled “Duties of Police Officers,” section 42(1) of the Ontario Police Services Act 1990 sets out a list of nine separate police responsibilities, the first six of which are:

- (a) preserving the peace;
- (b) preventing crimes and other offences and providing assistance and encouragement to other persons in their prevention;
- (c) assisting victims of crime;
- (d) apprehending criminals and other offenders and others who may lawfully be taken into custody;
- (e) laying charges and participating in prosecutions; and

<sup>47</sup> RCMP Act, s 18(1) and s 37(a)–(c). Note that section 18 contains a number of other duties, including the duty to execute all warrants and escort “convicts and other persons in custody to or from any courts.”

<sup>48</sup> RCMP Act, s 40.2(10).

<sup>49</sup> For a detailed survey of provincial police statutes, see Long, K and Hollands, A. (2014) “Memorandum: Murdered and Missing Indigenous Women Legal Strategies.” Legal Strategy Coalition on Violence Against Indigenous Women (July 2014), <https://www.leaf.ca/wp-content/uploads/2015/06/2014-07-14-LSC-Memo-re-MMIW-Legal-Strategies.pdf> (accessed 6 April 2022).

<sup>50</sup> Similar language with regards to the duties and functions of municipal police departments can be found in section 34(2) of the Act.

- (f) executing warrants that are to be executed by police officers and performing related duties

In addition to this list, section 42(3) of the Act also states that police officers in Ontario have “the powers and duties ascribed to a constable at common law.”<sup>51</sup> In Nova Scotia, the Police Act 2004 strikes something of a middle ground between these two approaches. While Section 30(1) sets out the duties of the provincial police, the list is less extensive than that found in the Ontario legislation and uses language that is more general than its equivalent in British Columbia:

A member of the Provincial Police is charged with the enforcement of

- (a) the penal provisions of all the laws of the Province;
- (b) any penal laws in force in the Province, other than laws of a municipality; and
- (c) the laws of a municipality, where specified by the Minister.

In the following section, however, the Act goes on to state that the provincial police *shall* provide policing services that include: crime prevention; law enforcement; assistance to victims of crime; emergency and enhanced services; and public order maintenance.

While it is beyond the scope of this report to provide a detailed analysis of all police legislation in Canada, even a cursory review of the statutes that govern policing reveals a striking lack of detail when it comes to the powers and responsibilities of the police. The relevant legislation does not lay down clear rules designed to limit different forms of police decision-making (as Davis’ understanding of discretion might demand) or provide a principled basis for the conferral of discretionary power (in the sense anticipated by Kleinig). Returning to Dworkin’s metaphor, the statutes may go some way to outlining the donut (the duties imposed on the police), but they say next to nothing about the hole (police discretion).

---

<sup>51</sup> The BC Police Act 1996 also states in s 38(1)(a) that municipal constables and special municipal constables have “all of the powers, duties and immunities of a peace officer and constable at common law or under any Act.”

## Understanding Police Discretion

Looking beyond statutes to the various administrative rules produced by the police themselves, the situation is not much better. As Ericson observed, throughout the 1970s and 1980s, police organizations in Canada and elsewhere produced a staggering volume of administrative rules, many of which purported to promote consistency and accountability in police decision-making and the exercise of discretion.<sup>52</sup> According to Ericson, however, researchers have found little evidence that such rules have any meaningful impact on police decision-making or accountability:

Analysts were quick to point out that administrative rule proliferation seemed to be largely a self-referential exercise in the management culture of police organizations. Most rules “died” as the ink dried on the paper on which they were printed. Again, the police do not simply follow the rules. Indeed, in most cases they are not even aware of them... Clearly, it cannot be contended that administrative rules control police decisions in any direct manner. Indeed, in recent years some police organizations have reduced or even scrapped their administrative rule manuals.<sup>53</sup>

The fact that neither the legislation nor police regulations meaningfully account for discretion means that Canadian courts have been left with the difficult task of determining whether the police are under a positive obligation to act in certain contexts and how their powers and duties should be understood against the backdrop of both private law and the *Charter*. In response, there is an emerging jurisprudence on police duties to protect, warn, and investigate, but as will be examined in the next section, the courts have so far struggled to provide a clear account of police discretion or a principled legal basis for its existence.

---

<sup>52</sup> Ericson (2007), 379. According to Ericson, the RCMP had generated 8800 pages of such rules by the early 1990s. For a more general discussion of administrative rule-making in Canadian policing, see also Ericson, RV & Haggerty, KD. (1997) *Policing the Risk Society*. Toronto: University of Toronto Press.

<sup>53</sup> Ericson (2007), 371–72.

### B. Duties to Protect, Warn, and Investigate<sup>54</sup>

Although legislation across Canada makes extensive use of the word “duty” when referring to the role and responsibilities of the police, the case law on police duties is relatively limited. As Buckley noted in her report on police duties for the BC Missing Women Commission of Inquiry, this is partly because the Canadian system of police accountability relies on a system of complaint and discipline but also because the common law has traditionally set a “high threshold for suing the police or prosecution authorities for failure to investigate crimes or inadequately investigating crimes.”<sup>55</sup>

Canadian courts have, however, held that the police have a general duty to protect, which can encompass similar duties to warn and investigate. The scope of this duty – and the question of whether a police officer can be said to have breached it as a result of a decision not to act – was considered by the Ontario Court (General Division) in *Jane Doe v Toronto (Metropolitan) Commissioners of Police* (1998).<sup>56</sup> In this case, the plaintiff was sexually assaulted by a man who entered her second-floor apartment from a balcony. Four similar assaults had occurred within the same area in the months leading up to the attack, and the police chose not to warn the public of the danger out of fear the assailant might escape apprehension. The plaintiff sued the Metropolitan Toronto Police for damages on the grounds that (1) the police conducted a negligent investigation and failed to warn women of the risk of an attack; and (2) the police had

<sup>54</sup> This report does not provide an analysis of the current law for use in legal submissions or legal proceedings, and the discussion in this section should be viewed exclusively as scholarly overview and assessment of the relevant case law.

(2012) “Violence against Women: Evolving Canadian and International Standards on Police Duties to Protect and Investigate.” Background research report for the British Columbia Missing Women Commission of Inquiry (June 2012), <https://missingwomen.library.uvic.ca/wp-content/uploads/2010/10/RESE-5-June-2012-MB-Violence-Against-Women-Evolving-Legal-Standards-on-Police-Duties-to-Protect-Investigate.pdf> (accessed 6 April 2022).

<sup>56</sup> *Jane Doe v Metropolitan Toronto (Municipality) Commissioners of Police* [1998] OJ No 2681 (QL).

## Understanding Police Discretion

violated the plaintiff's rights under sections 7 and 15 of the *Charter*. In what is widely regarded as a landmark decision, the court found in favour of the plaintiff on both counts. Speaking directly to the question of police duties and negligence, Justice MacFarlane was clear that the police could be held responsible in tort for their failure to protect the plaintiff and other victims:

In my view, the police failed utterly in their duty to protect these women and the plaintiff in particular from the serial rapist the police knew to be in their midst by failing to warn so that they may have had the opportunity to take steps to protect themselves... Here police were aware of a specific threat or risk to a specific group of women and they did nothing to warn those women of the danger they were in, nor did they take any measures to protect them.<sup>57</sup>

In reaching this conclusion, the court observed that the “police are statutorily obligated to prevent crime and at common law they owe a duty to protect life and property,” citing as authority the decision of Schroeder JA in *Schacht v The Queen* some 25 years earlier:

The duties which I would lay upon them [the police] stem not only from the relevant statutes to which reference has been made, but from the common law, which recognizes the existence of a broad conventional or customary duty in the established constabulary as an arm of the state to protect the life, limb and property of the subject.<sup>58</sup>

Although the decision in *Jane Doe v Toronto Police* refers to police discretion only once, in its discussion of the relevant *Charter* issues, the court noted that such discretion must be exercised in a manner that is consistent with the principles of fundamental justice. In this case, the use of that discretion was found to be both discriminatory and negligent. Significantly, the court also noted that a lawful exercise of discretion could provide the basis for a claim in negligence. On this point, Justice MacFarlane referred approvingly to the earlier decision of the Divisional Court in the same case. Responding to a motion to strike out the plaintiff's statement

<sup>57</sup> *Jane Doe v Toronto Police* [1998], 46.

<sup>58</sup> *Schacht v The Queen in right of the Province of Ontario et al* (1973), 1 OR 221, 231. Although the decision in *Schacht* is still a authority for the proposition that the police owe a common law duty to protect, Bruce Feldthusen has suggested the case might not be decided the same way in light of recent Supreme Court decisions. See Feldthusen, B. (2017) “Bungled Police Emergency Calls and the Problems with Unique Duties of Care” *University of New Brunswick Law Journal* 68: 169–201, 187.

of claim, Moldaver J (as he then was) observed that simply because an exercise of police discretion is legitimate, it does not necessarily follow that the duty that discretion is being exercised in relation to has been discharged:

The law is clear that in certain circumstances, the police have a duty to warn citizens of foreseeable harm... I would add to this by saying that in some circumstances where foreseeable harm and a special relationship of proximity exist, the police might reasonably conclude that a warning ought not to be given... It would, however, be improper to suggest that a legitimate decision not to warn would excuse a failure to protect. The duty to protect would still remain. It would simply have to be accomplished by other means.<sup>59</sup>

The question of whether the police can be held liable for failing in their duty to protect was also considered in *BM v British Columbia (Attorney General)*.<sup>60</sup> Here the plaintiff brought an action in negligence against the RCMP for their failure to investigate her complaint against a former common law partner despite his documented history of serious violence towards her and others. Seven weeks after an RCMP officer declined to investigate the plaintiff's complaint, which she made immediately after being threatened and chased by the defendant, the defendant broke into her home with a shotgun, murdered her friend, and shot her then twelve-year-old in the shoulder. After the plaintiff and her children managed to escape, the defendant burned down the house and committed suicide. Although the action failed on the grounds that the plaintiff was unable to establish a sufficient causal connection between the police decision not to investigate and the eventual attack, the trial judge held that the police clearly owed the plaintiff a private duty of care.

Although the decision in *BM v BC Attorney General* has been subjected to significant criticism,<sup>61</sup> in confirming that the police could be held liable for a failure to discharge duties

## Understanding Police Discretion

imposed on them by law, the case built on judicial momentum established by *Jane Doe v Toronto Police* less than a decade earlier. This momentum culminated some three years later in a pair of decisions handed down by the Supreme Court – *Hill v Hamilton-Wentworth Regional Police Services Board* [2007] and *R v Beaudry* [2007] – both of which dealt directly with the relationship between police discretion and police duties.<sup>62</sup>

The decision in *Hill v Hamilton-Wentworth Police* is particularly significant on two fronts. First, the Supreme Court stressed that the inherently discretionary nature of police work did not insulate the police from liability in negligence. Instead, the Court noted that the police were required to exercise their discretion “in accordance with professional standards and practices, consistent with the high standards of professionalism that society rightfully demands of police in performing their important and dangerous work.”<sup>63</sup> Going further, the Court also noted:

Police are not unlike other professionals in this respect. Many professional practitioners exercise similar levels of discretion. The practices of law and medicine, for example, involve discretion, intuition and occasionally hunch. Professionals in these fields are subject to a duty of care in tort nonetheless, and the courts routinely review their actions in negligence actions without apparent difficulty.<sup>64</sup>

Secondly, the Court rejected any suggestion that recognizing the police owe a private law duty of care would have a chilling effect on policing. In addition to noting that there was no empirical evidence to support such a suggestion, the Court went on to observe that even if it was the case that exposing the police to liability in tort might alter their behaviour, this may in fact be desirable:

---

*Journal of Women & Law* 17(1): 87–116; Chamberlain, E. (2012) “Tort Claims for Failure to Protect: Reasons for (Cautious) Optimism since *Mooney*” *Saskatchewan Law Review* 75: 245.

<sup>62</sup> *Hill v Hamilton-Wentworth Regional Police Services Board* [2007] 3 SCR 129; *R v Beaudry* [2007] 1 SCR 190.

<sup>63</sup> *Hill v Hamilton-Wentworth Police* [2007], para 52.

<sup>64</sup> *Hill v Hamilton-Wentworth Police* [2007], para 53.

In theory, it is conceivable that police might become more careful in conducting investigations if a duty of care in tort is recognized. However, this is not necessarily a bad thing. The police officer must strike a reasonable balance between cautiousness and prudence on the one hand, and efficiency on the other. Files must be closed, life must move on, but care must also be taken. All of this is taken into account, not at the stage of determining whether police owe a duty of care to a particular suspect, but in determining what the standard of that care should be.<sup>65</sup>

These ideas – that police discretion is not absolute and must be exercised according to standards – was echoed and then elaborated on further in *R v Beaudry*. Crucially, the Court held that any exercise of discretion must be capable of being justified on both subjective and objective grounds – that is, although officers are free to use their judgment when performing everyday duties, that same judgment must be exercised without bias and on the basis of legally relevant factors:

Far from having *carte blanche*, police officers must justify their decisions rationally. The required justification is essentially twofold. First, the exercise of the discretion must be justified subjectively, that is, the discretion must have been exercised honestly and transparently, and on the basis of valid and reasonable grounds. Thus, a decision based on favouritism, or on cultural, social or racial stereotypes, cannot constitute a proper exercise of police discretion. However, the officer’s sincere belief that he properly exercised his discretion is not sufficient to justify his decision.<sup>66</sup>

Taken together, these cases mark a significant shift in the approach taken by Canadian courts to the exercise of police discretion. As Bronitt and Stenning have rightly observed, they both “affirm the centrality and legitimacy of police discretion, and impose new duties, and potential civil and criminal liabilities, on police officers.”<sup>67</sup> They also mark a break from the approach taken in other common law jurisdictions, where courts remain reluctant to expose the police to actions in tort for failures to discharge statutory duties.<sup>68</sup> Having said this, a number of commentators have suggested that these decisions do not go far enough and provide limited

## Understanding Police Discretion

remedies for harms arising from the misuse of police discretion.<sup>69</sup> As will be discussed below, this leaves open the question of whether legislators at the federal and provincial levels should take a more proactive role in regulating the exercise of police discretion and provide statutory remedies where the police have failed to discharge fundamental duties, including the duties to protect and warn.

### C. The Role of the *Charter*

To date, there have been very few examples of the *Charter* being used as the basis of legal actions against the police – or broader efforts to hold police organizations accountable for harms arising out of investigative failures or operational decisions. One of the most notable remains *Jane Doe v Toronto Police*, where the court upheld the plaintiff’s claims in relation to sections 15(1) and 7 of the *Charter*. As has already been noted, the court made clear that police discretion must be exercised in accordance with principles of fundamental justice, and where the actions of the police lead to an infringement of a plaintiff’s *Charter* rights, they can be held accountable:

The police investigation was carried out in a way that denied the plaintiff equal protection and equal benefit of law as guaranteed to her by s 15(1) of the *Charter*. The conduct of the investigation and, in particular, the failure to warn was motivated and informed by the adherence to rape myths as well as sexist stereotypical reasoning about rape, about women, and about women who are raped. The plaintiff was discriminated against by reason of her gender. Women were treated differently because some members of the force adhered to sexist notions that, if warned, women would panic and scare off the attacker. Further, the defendants deprived the plaintiff of her right to security of the person under s 7 of the *Charter* by subjecting her to the very real risk of attack by a serial rapist. They were aware of the risk but deliberately failed to inform her of it. Because the defendants exercised their discretion in the investigation in a discriminatory and negligent way, their exercise of discretion was contrary to the principle of fundamental justice. The plaintiff was entitled to an award of damages as a remedy under s 24 of the *Charter*.<sup>70</sup>

<sup>69</sup> Buckley (2012), 25. See also Sossin, L. (2007) “The Oversight of Executive Police Relations in Canada: The Constitution, the Court, Administrative Processes and Democratic Governance.” Research Paper Commissioned by the Ipperwash Inquiry, [https://www.attorneygeneral.jus.gov.on.ca/inquiries/ipperwash/policy\\_part/meetings/pdf/Sossin.pdf](https://www.attorneygeneral.jus.gov.on.ca/inquiries/ipperwash/policy_part/meetings/pdf/Sossin.pdf) (accessed 6 April 2022).

<sup>70</sup> *Jane Doe v Toronto Commissioners of Police* [1998], 3–4.

As significant as this decision was at the time, there is little evidence to suggest that it led to an increase in *Charter*-based actions against the police or more judicial scrutiny of police decision-making and discretion. As Buckley has pointed out, the willingness of the court to use constitutional remedies when dealing with claims against the police “underscores that civil liberties and fundamental human rights are always at stake in police decision-making,”<sup>71</sup> but it nevertheless remains the case that the *Charter* jurisprudence on police duties and the role of discretion is underused and underdeveloped. This raises the question of whether *Charter* litigation can or should be regarded as a potential avenue for imposing limitations on the use of police discretion.

#### **D. Revisiting Questions of Definition**

In many respects, it is possible to see Kleinig’s view of police discretion – as a privilege granted by law – running through Canadian decisions like *Jane Doe v Toronto Police*, *BM v British Columbia*, *Hill v Hamilton-Wentworth Police*, and *R v Beaudry*. Certainly, the courts have acknowledged that the exercise of police discretion must be understood in the context of the duties imposed on the police by statute and common law. As will be discussed in the final section of this report, however, these cases also expose the limits of judicial oversight and regulation when it comes to police decision-making. The courts may be willing to hold the police accountable for failing to discharge various duties to protect, warn, and investigate, but they have been reluctant to address more fundamental questions about the nature and legal legitimacy of police discretion.

---

<sup>71</sup> Buckley (2012), 27.

## Understanding Police Discretion

Before leaving questions of definition, it is worth pausing to consider another view of police discretion in the Canadian context. Writing in 2007, Ericson argued that it is a mistake to regard police discretion as something that exists outside of or in opposition to criminal law and procedure. Drawing on the work of an array of police scholars in Canada and the United Kingdom, Ericson instead suggested that such discretion should be understood as a *product* of criminal law and procedure, *enabled* in part by an adherence to the idea of policing by consent on the part of both the police and the policed:

Policing by consent is the usual way in which police work gets done. Having the subject of police investigation consent to routine information checks, searches and interrogations avoids statutory requirements. For example, a consenting suspect can be searched without reasonable and probable grounds for suspicion. Policing by consent also reduces the visibility of police discretion. Records are less likely to be kept and supervision is rendered more difficult. Researchers have observed that consent is usually sought even when police have obtained warrants that legally authorize their investigative activity because it is preferable to do business in a compliance mode.<sup>72</sup>

Although Ericson did not attempt to define police discretion or to engage directly with either Davis' or Kleinig's contrasting approaches, his account can be seen as straddling the two positions. On the one hand, Ericson recognized (as Davis did) that police discretion arises out of the spaces created by law and the pragmatic demands of police work; on the other, he acknowledged (as Kleinig has) that police discretion is also a direct product of law and enabled by it. Notably, Ericson also drew attention to the fact that law can be used as a framework for rationalizing police decisions and exercises of discretion after the fact so as to render them legitimate and appear to be governed by rules. Police decisions are "routinized through the use of formulaic phrases that not only justify the decisions taken but also serve as a form of rhetoric," with this rhetoric crucially providing other actors (such as lawyers and judges) with the sort of

---

<sup>72</sup> Ericson (2007), 373, citing Ericson, R.V. (1981) *Making Crime: A Study of Detective Work*. Toronto: Butterworths and Dixon, D. (1997) *Law in Policing*. Oxford: Clarendon Press

comprehensible rationale needed to ratify those decisions.<sup>73</sup> Tellingly, Ericson drew a connection between these processes of rationalization and the role of police culture – both in terms of how rules are understood and how actions are explained in relation to those rules.<sup>74</sup> Although it is well beyond the scope of this report to explore the relationship between police discretion and police culture, these complex dynamics should be front of mind in any broader discussion about police decision-making and accountability.

#### IV. Factors Influencing Police Discretion

Discretion plays a central role in almost every aspect of policing in Canada. Regardless of whether we view police discretion as a capacity or a resource, the fact remains that the use of this discretion determines not only how and when the law is (or is not) enforced but also how policing policies and priorities are determined, how police resources are allocated and deployed, and how the police engage with other state agencies, private organizations, and the public at large. Put simply, it is impossible to understand policing in Canada without also understanding how police discretion operates and, more importantly, what factors influence the exercise of this discretion.

Unsurprisingly then, there is a vast body of academic literature on how police discretion is exercised.<sup>75</sup> Building on the early insights of scholars like Herman and Joseph Goldstein, as well as criminologists such as Herbert Packer, Jerome Skolnick, and Egon Bittner,<sup>76</sup> hundreds of

## Understanding Police Discretion

studies of police discretion have been published over the last 50 years, many of which focus on understanding how discretion operates in particular contexts and the role it plays in police organizations and police working culture. Although this literature is extensive, it is also limited in a number of important ways. As has already been noted, with few exceptions, most scholars have either explicitly or implicitly been content to take Davis' definition as their starting point and treat police discretion as something that is somehow extra-legal, used by the police to fill the gaps apparently left by law. As a result, critiques of police discretion have tended to concentrate on the consequences that flow from its use rather than on the more fundamental question of whether the police should be permitted to have discretion in certain contexts in the first place.

To some extent, this lack of focus on the definitional question can be seen as a consequence of the low-visibility problem identified by Joseph Goldstein in the 1960s. If police discretion is something that is exercised out of sight and is not easily eliminated, then the question understandably becomes: what are the observable outcomes of police discretion and how should we respond to apparent abuses of it? And when attention has been directed to the question of how to regulate and limit police discretion, the focus has been not so much on law and the legal basis of discretion but rather on police attitudes and behaviour. As a consequence, police recruitment, police training, police discipline, and external oversight have all taken centre stage, with the result that the question of whether it is possible to eliminate police discretion via law in certain key contexts is rarely seriously considered.

Another limitation of the research on police discretion has been its relatively narrow focus, most notably on decisions to stop and arrest. This is in part because decisions to stop and arrest are among the more visible examples of police discretion. Often taken in full view of the public, the decision to stop and arrest an individual is particularly significant because it marks a

crucial moment at which the individual comes into direct contact with the power of the criminal justice system and the state – and open to the prospect of charge, detention, prosecution, and punishment. In this respect, the decision to stop and arrest (or not) is a gateway decision, determining not only how an individual suspected of a crime will be dealt with (or not) but also the contours of the criminal justice system itself. As such, the decision to stop and arrest has the potential to embody the sorts of “discretionary injustices” highlighted by Davis in his examination of police power.

The other main reason why the practice of stop and arrest – and the role played by police discretion in those decisions – has attracted so much attention is due to concerns about the factors influencing that discretion. There is an abundance of evidence that decisions to stop and arrest are subject to various forms of bias based on the race, appearance, and demeanour of suspects, with the result that certain groups are radically over-represented when it comes to arrest and charging rates.<sup>77</sup> Since the 1960s, concerns over racial profiling and other forms of selective policing and law enforcement have led to multiple studies aimed at identifying and mitigating the factors that influence the decision to stop and arrest. Although the majority of these studies have been carried out in the United States, research in Canada has also produced compelling evidence of racial bias when it comes to the decision to stop and arrest. As Professor Kanika Samuels-

## Understanding Police Discretion

Wortley explained in her evidence to the Standing Committee on Public Safety and National Security:

[R]acial differences with respect to police contact remain even after controlling for other relevant factors including gender, social class, neighbourhood characteristics and criminal behaviour... In other words, racial differences in police contact cannot be explained away by poverty or involvement in crime. Race matters. If you're a Black man in Canada, the question is not if you will be stopped, but when.<sup>78</sup>

These findings are significant because they shed light not simply on how discretion operates in the context of stop and arrest but also on larger problems of systemic racism in Canadian policing and the criminal justice system more broadly. Yet as important as decisions to stop and arrest are, the lack of research on how discretion operates in other contexts has resulted in an incomplete picture of police decision-making. As Smith et al have observed:

Research on police decision-making during encounters with citizens addresses only a very small portion of what officers do during the course of their work. Because these behaviors are examined within the context of police–citizen interactions, they largely ignore activities taken outside the presence of citizens. As such, questions remain about what explains officer discretionary behavior when they are not in contact with citizens... There remains a dearth of research addressing officer choices beyond police–citizen encounters and unrelated to the invocation of police authority. This shortcoming is exacerbated by the relative lack of research since the advent of community policing.<sup>79</sup>

This is a point that has also been made by Jennifer Schulenberg, who has argued that research on police discretion needs to move beyond the narrow focus on the decision to arrest.<sup>80</sup> After noting that we lack a comprehensive understanding of police decision-making as it relates to less significant exercises of power than an arrest, Schulenberg has referred to work by Worden, who has argued that we need to exercise caution when drawing general lessons about police behaviour from research on arrest alone:

<sup>78</sup> Standing Committee on Public Safety and National Security (Canada). (2021) “Systemic Racism in Policing in Canada.” House of Commons, 43rd Parliament, 2nd session, <https://www.ourcommons.ca/Committees/en/SECU/StudyActivity?studyActivityId=10959882> (accessed 6 April 2022), 58.

<sup>79</sup> Smith, BW, Novak, KJ, Frank, J, & Lowenkamp, C. (2005) “Explaining Police Officer Discretionary Activity” *Criminal Justice Review* 30(3): 325–46, 326–27.

<sup>80</sup> Schulenberg (2015), 248.

[I]t appears that the arrest decision is unique in that it is based to a significant degree on situational cues that officers interpret in similar ways. Consequently, while analyses using arrests as a dependent variable might be useful for some analytic purposes, they are quite limited as vehicles for the development of a broader theory of police behavior... [S]ituational explanations of the arrest decision probably cannot be successfully applied to the other choices that police officers make on the street; continued research on the situational determinants of police behavior, to the exclusion of other factors, may be of limited theoretical value.<sup>81</sup>

Building on this point, it is also important to note that there are other, deeper methodological problems associated with the research on police discretion. As Nickels has noted, the absence of a clear and coherent definition of police discretion – combined with the fact that exercises of discretion are rarely capable of being observed directly – means that much of the research literature on police discretion is essentially inferential in nature:

Nowhere within this vast body of research is “discretion” itself directly operated, measured, or associated with any cause or effect. The status of the term is entirely ambiguous. It seems implied that discretion refers to either the observed behavior of police or its variability, or to the measured influence of extralegal factors on such behavior. At the same time, it seems to refer to some unobserved (perhaps unobservable) process through which explanatory models bridge extralegal factors to behavioral outputs—some “black box” of the subject’s consciousness... None of this research can properly be understood as studying discretion, per se. Instead, it is the examination of police behavior as determined by a number of causal variables, among which one finds no specific variable labeled “discretion.”<sup>82</sup>

In many respects, Nickels’ analysis of this fundamental lacuna resembles the critique levelled above, namely that policing legislation and regulation fail to adequately account for police discretion per se.

It is against this general background and with these important limitations in mind that this section provides a summary of the factors that influence police discretion. Far from attempting to present a comprehensive overview of the research on police discretion in Canada and elsewhere, the aim is instead to provide a broad typology of factors that influence the exercise of that

<sup>81</sup> Worden, RE. (1989) “Situational and Attitudinal Explanations of Police Behavior: A Theoretical Reappraisal and Empirical Assessment” *Law and Society Review* 23: 667–711, 702 (quoted in part in Schulenberg (2015), 247).

<sup>82</sup> Nickels (2007), 571.

## Understanding Police Discretion

discretion, focusing on the distinction between individual and situational factors, as well as the role of environment and place. This overview will then be used as the basis for the discussion of paths to reform in section V.

Before proceeding, however, it is important to note that any discussion of the factors that influence police discretion needs to be sensitive to the unique organizational contexts of policing. Although police services in Canada conform to a standard bureaucratic arrangement – with seniority and managerial responsibility being concentrated at the top of the organization – in contrast to many other public agencies, a great degree of discretionary power rests with those at the bottom of the hierarchy, most notably frontline police officers. It is these officers who are routinely called on to make decisions about when to enforce the law, respond to complaints, and investigate possible crimes. When coupled with the fact that much of this discretion is typically exercised in low-visibility environments (for example, on the street or in police vehicles), this leads to the least senior members of the organization wielding significant amounts of unsupervised authority. As Johnson et al have observed:

Police organizations fit very well with Weber’s classical model of organization. The mandate of police organizations as the coercive arm of the state inherently requires strict control and formal structure. The adoption of a paramilitaristic structure has traditionally been applied to police organizations as the organizational model to provide such regimentation. However, the paramilitaristic structure, with its strict formality and chain of command, is in conflict with the devolution of authority necessary for responsive street-level decision-making supported by a rational-legal organizational structure.<sup>83</sup>

<sup>83</sup> Johnson, AD & Vaughn, MS. (2016) “Decoupling and Police Organizational Structure” *Administrative Theory & Praxis* 38(3): 157–67, 158–59, citing Terpstra, J. (2011) “Two Theories on the Police: The Relevance of Max Weber and Emile Durkheim to the Study of the Police” *International Journal of Law, Crime, and Justice* 39: 1–11; Weber, M. (1947) *The Theory of Social and Economic Organization*, AM Henderson and T Parsons (trans). New York: Oxford University Press; Gilbert, MJ. (1997) “The Illusion of Structure: A Critique of the Classical Model of Organization and the Discretionary Power of Correctional Officers” *Criminal Justice Review* 22(1): 49–64; Brown, MK. (1981) *Working the Street: Police Discretion and the Dilemmas of Reform*. New York: Russell Sage Foundation, 70.

Acknowledging this institutionally embedded conflict between an outward, formal adherence to chains of command and the day-to-day realities of ordinary police work is essential if we are to understand the role played by police discretion in Canada. Regardless of whether we view discretion as a capacity or a resource, the fact remains that efforts to control the exercise of that discretion will depend in large part on the ability of police services – or external bodies – to control the behaviour and change the working practices of frontline officers.

As a final point, it is also important to note that many of the studies referred to in this report focus almost exclusively on large metropolitan or urban police services, and there is a very limited body of research on the use of police discretion in rural police departments. As Fyfe observed over twenty years ago, the problem is compounded by the fact that many of the police departments that have been the subject of extensive study may not themselves be especially representative, even of large urban forces:

The extant research on police discretion is biased in a number of ways regarding the types of agencies that are included. The vast majority of studies focus on relatively large municipal police forces, leaving mostly unexplored small urban departments, sheriff's departments, rural agencies, special police agencies, and large but geographically dispersed state police agencies. There are reasons to expect some different patterns in the exercise of police discretion from the usually studied agencies, thus undoubtedly restricting the possibility of new insights about what influences police discretion under what circumstances. And perhaps most telling, except for the occasional research compelled by legal process, research on police discretion tends to occur at the more progressive agencies that have less discomfort in exposing themselves to scrutiny by outsiders.<sup>84</sup>

Despite these various caveats and qualifications, it is important not to lose sight of the fact that there is a broad consensus in the research literature on the types of factors that do influence police discretion. While we must exercise caution when talking about particular contexts – and especially specific police services in Canada and elsewhere – there is now over

## Understanding Police Discretion

sixty years of research on police discretion, much of it focused on the central question of how officers make decisions and what affects their exercise of discretion.

### **A. The Factors Influencing Police Discretion**

One of the key questions that has faced researchers seeking to understand the phenomenon of police discretion is how to distinguish between the different variables and factors that influence the exercise of this discretion. Writing in 1980, the US criminologist Lawrence W. Sherman suggested that police behaviour is best understood as being dependent on variables that fall into one of five broad categories: individual, situation, organization, community, and legal. Given how influential Sherman's typology has been in terms of structuring subsequent discussions of police discretion over the last forty years, his classification is worth noting in full:

The approaches to explaining the variation in these aspects of police behavior can be classified into five levels of analysis: individual, situational, organizational, community, and legal. The individual approach attempts to explain variation in the behavior of police officers with the characteristics of the officers themselves, such as length of service, race, and sex. The situational approach attempts to explain the outcomes of citizen–police encounters with the characteristics of the situation, such as relationship between complainant and suspect, number of police officers present, whether the encounter was initiated by a citizen request or a police decision to intervene, and demeanor, race, class, and other characteristics of the suspect and complainant. The organizational approach attempts to explain rates of police behavior across either suborganizational units or entire police organizations with such characteristics as patrol strategy or percentage of college graduates in a police department. The community approach attempts to explain rates of police behavior across municipal police departments with the characteristics of the communities they police, such as economic and demographic composition, political ethos, or structure of government. Finally, the legal approach attempts to explain police behavior at various levels with the constraints of procedural and substantive law that the written legal system attempts to impose on the police.<sup>85</sup>

As Sherman went on to note, none of these five approaches amounts to a “substantive theory of police behaviour.” Instead, they provide limited empirical support for claims about the influence of particular variables on police decision-making. Significantly, Sherman stressed that

---

<sup>85</sup> Sherman, L.W. (1980) “Causes of Police Behavior: The Current State of Quantitative Research” *Journal of Research in Crime and Delinquency* 17(1): 69–100, 70.

much of the research on policing he surveyed in producing his five categories was focused on “bivariate assertions” – that is, they considered the impact of a single variable (such as suspect demeanour) on police behaviour. Multivariate studies were at the time few and far between, something Sherman argued was a shortcoming that needed to be addressed in order to develop a comprehensive and useful theory of police behaviour.

In the years following Sherman’s article, a number of writers have sought to refine and build on his initial classifications. According to Worden, for example, it is possible to divide research on the factors that influence police discretion into two broad categories: situational and attitudinal:

Situational explanations hold that officers’ behavior in police–citizen encounters is influenced by structural characteristics of the immediate situation: the nature of the problem, the attributes and actions of the citizens, and contextual variables. Research of this genre has led to the conclusion that officers’ behavior is largely a response to situational cues (Berk and Loseke, 1980–81). The second approach is to examine the behavioral patterns of individual officers to explain variation in terms of officers’ attitudes. Attitudinal explanations hold that officers develop distinctive “styles” of performing their duties, and that the development of their behavioral styles is shaped by their attitudes and values.<sup>86</sup>

Although Worden cited Sherman before presenting his own classification scheme – with the implication that it represents a condensed version of Sherman’s approach rather than a departure from it – Worden’s focus on these two broad categories marked a significant step forward in the study of police discretion. By explicitly drawing out the notion of policing “styles,” Worden drew a clear distinction between the impact of what might be regarded as internal and external factors when it comes to the exercise of police discretion. Put another way, we can understand situational factors as encompassing things external to an officer (and police organization), while

---

## Understanding Police Discretion

attitudinal factors relate to the characteristics of the officers and organizations themselves. This distinction provides a simple but powerful way of distinguishing between factors for the purpose of reform. While it may, for example, be possible to change the way in which situational factors affect police decision-making through policies, guidelines, legal rules, and other such formalized mechanisms, attempts to affect attitudinal variables are more likely to be aimed at recruitment, training, oversight, and discipline.

In his review of the research on police discretion, Worden also made a number of observations that continue to resonate. First, he drew attention to the fact that the emphasis on arrest decisions is problematic, not just for the reasons identified above but also because it impedes “further theoretical progress.”<sup>87</sup> Second, Worden drew attention to the fact that many accounts of police discretion start from the assumption that the boundaries of an officer’s authority – and the objectives that the officer is expected to pursue – are “clearly defined and well understood.” This is in fact rarely the case, and something that needs to be accounted for in our efforts to understand how discretion is exercised in practice:

[A] theory of police behavior must also reflect the ambiguity and uncertainty of the task environment in which officers work, where formal and informal rules and procedures are in many cases vague and may even conflict, characteristics of the incidents into which they intervene may be variously interpreted, causal connections between actions and outcomes may be unclear, and the objectives toward which they are expected to direct their efforts are stated in general terms (if at all) and may be inconsistent. Officers must interpret these features of the task environment as they choose their courses of action. This ambiguity and uncertainty, I shall argue, can be expected to attenuate the relationships between situational factors and officers’ attitudes on the one hand and officers’ behavior on the other.<sup>88</sup>

Finally, Worden also acknowledged the need for theories of police behaviour and discretion to pay greater attention to the structural features of police organizations, either by

---

<sup>87</sup> Worden (1989), 668.

<sup>88</sup> Worden (1989), 671.

comparing officer behaviour across different types of police departments or through incorporating structural variables into future studies. Unfortunately, Worden’s call for more research on the organizational determinants of police discretion went largely unheeded. Writing some seventeen years later in 2006, Chappell et al observed that only a few studies – most notably by Smith in 1984 and then Mastrofski, Ritti and Hoffmaster in 1987 – had examined the influence of police organizational structures on the decision to arrest.<sup>89</sup> Despite the fact that these studies suggested that “variations in departmental management styles and culture [could] explain a significant amount of variation in the proclivity of police officers to exercise their arrest powers,” Chappell et al noted that their continued relevance was limited due to a reliance on historical data and changes in the policing landscape since the 1980s – changes that saw many police departments in the United States move to problem-oriented strategies and a greater emphasis on community policing.<sup>90</sup> For their part, Chappell et al suggested that the organizational typology first developed by Wilson in 1968 – which categorized police agencies according to whether the officers within those agencies adhered to a “watchman,” “legalistic,” or “service” style<sup>91</sup> – was of “limited use” when it came to contemporary discussions about the influence of organizational structure and working culture on police discretion. Instead, they argued that organizational factors may not be that important at all:

The findings from this study suggest that the policing literature and conventional wisdom on controlling police discretion may place too much emphasis on the influence of organizational context. Officers may be more driven by the situational exigencies that vary from community to community – many of which are beyond the direct control of police bureaucrats.<sup>92</sup>

## Understanding Police Discretion

Returning to the question of classification, in a recent multivariate study of police arrest decisions, Jessica Huff has suggested that much of the work on police discretion to date can be seen as contributing to two broad theoretical frameworks. The first of these frameworks, which Huff has referred to as “officer-oriented theories of police discretion and arrest decisions,” maintains that the exercise of police discretion depends largely on the attitudes of individual police officers and their demographic characteristics, as well as the attitudes, demeanour, and characteristics of the suspects, victims, and members of the public with whom the police interact. Into this category she places work by DJ Black, whose early sociolegal account of police discretion has remained highly influential.<sup>93</sup> Black argued that the use of police discretion in any given situation will vary according to the relative social positions of those involved, most notably the officer, the suspect, and the victim.<sup>94</sup> As Huff has noted, Black also drew attention to the fact that certain discretionary decisions necessarily involved “more law” than others, which could have an impact on the relevant power dynamics that underpin the decision-making process:

One of the major contributions of [Black’s] work is the proposition that law varies in quantity, with some actions constituting more law than others... This means that those of higher social standing are more able to invoke the law, that law enforcers are more likely to apply the law against those of lower social standing than themselves, and that laws will be more strictly enforced in low status neighborhoods.<sup>95</sup>

Into this same category, Huff has also placed work by Steve Herbert on the importance of normative ordering in policing, as well as a range of studies that have examined the potential role played by various officer characteristics in the use of discretion, including an officer’s race or

<sup>95</sup> Huff (2021), 7.

membership of a particular ethnic group; their gender; their level of education; and their length of service.<sup>96</sup>

The second theoretical framework identified by Huff, which she has referred to as “social-ecological theories of police discretion and influences on arrest,” includes research that explores the relationship between discretion and neighbourhood characteristics, including crime rates, socioeconomic factors, and racial heterogeneity. As Huff notes, much of this work has focused specifically on identifying the sources of racial bias in policing:

An enduring debate in the policing research is whether identified racial/ethnic disparities in discretionary outcomes are due to biased decision-making (whether implicit or explicit) or to differential concentrations of crime and police resource deployment. This has resulted in examinations of the influence of neighborhood characteristics on variation in officer use of discretion across different social-ecological contexts.

Importantly, Huff has also included various social control theories in this second framework, including early work by Blalock and others that suggest the police use law – and the power to arrest – as a means of controlling minority populations.<sup>97</sup> Research on the role of place – in particular, the socio-economic characteristics of neighbourhoods – is also included in this category, with Huff noting that it provides “mixed support” for social-ecological theories of police discretion.<sup>98</sup>

## Understanding Police Discretion

Although Huff has not purported to provide a comprehensive overview of the research on police discretion, her theoretical frameworks allow for the easier identification of particular currents in what is a vast body of literature. Notably, she has also acknowledged that – regardless of whether the research in question falls into the category of officer-oriented theories or social-ecological theories of police discretion – it is generally accepted in the literature that situational factors play a significant role when it comes to police decision-making. As Huff has noted, for example, multiple studies have suggested that offence seriousness is a key factor in the decision to arrest. Similarly, the question of whether an arrest resulted from a public complaint (or was instead police-initiated) can also have an impact on the exercise of police discretion.<sup>99</sup>

As this brief overview of efforts to classify the factors affecting police discretion has demonstrated, there is no comprehensive theory of police behaviour that can provide a clear account of how the police exercise their decision-making powers. As Huff has rightly observed, this is due in part to the challenges associated with developing multivariate models of police behaviour. While researchers might agree that direct observation of officer behaviour and decision-making would provide the clearest insight into the operation of police discretion – what Huff has referred to as “systematic social observation” – in most instances, this is simply too expensive and time-consuming (and requires significant access by researchers to the police, which in many cases is difficult to obtain).

It is with these limitations in mind that the next section provides an overview of recent research on police discretion carried out in Canada, identifying significant gaps in our understanding of how police discretion currently operates at the municipal, provincial, and

federal levels, and highlighting major areas of interest and concern for police researchers, as well as possible avenues for future work.

### **B. Recent Research on Police Discretion in Canada**

It is important to note that empirical research on policing in Canada – and on police discretion in particular – is much less extensive than that to be found in countries like the United States or the United Kingdom. Even when compared to countries with a similar population size such as Australia, it remains the case that independent studies of Canadian police behaviour and discretion are few and far between. This report does not consider in detail the reasons for the dearth of Canadian research in this area. However, a combination of factors no doubt play a role, including the relative lack of government and charitable foundation funding for large-scale qualitative research on policing, as well as the difficulties that face researchers seeking access to policing organizations at all levels in Canada.<sup>100</sup> Moreover, much like in other jurisdictions, what research there is on police discretion in Canada has focused almost exclusively on the decision to arrest. But as has already been noted, the “social intervention” aspect of policing involves many forms of formal and informal decision-making, and caution therefore needs to be exercised when extrapolating conclusions about the exercise of police discretion from only the specific context of arrest.<sup>101</sup>

In terms of the research itself, in Canada the focus has been primarily on the role of discretion in the policing of minorities and young people. Although a number of independent

## Understanding Police Discretion

inquiries have investigated the under- and over-policing of Indigenous communities and systemic problems with respect to the police response to violence against Indigenous women and girls,<sup>102</sup> very few empirical studies have directly examined the operation of discretion with respect to the policing of Indigenous people.<sup>103</sup> This presents a significant problem when it comes to discussions about the role of police discretion in Canada, particularly given that it is now generally accepted that many municipal and provincial police services – as well as the RCMP – suffer from longstanding problems of systemic racism. As Chief Bryan Larkin observed in his Presentation to the Standing Committee on Public Safety and National Security in 2020, we have “study after study, including government commissioned reports, that demonstrate we have an issue with systemic racism throughout our justice system, which includes our legal system, our courts, and our police services.”<sup>104</sup> Given this, there is clearly a pressing need for

<sup>104</sup> Evidence, 1st Session, 43rd Parliament, Meeting 12, 14 August 2020, 1215 (Chief Bryan Larkin, Chief of Police, Waterloo Regional Police Service, and member of the Drug Advisory Committee, Canadian Association of Chiefs of Police). See also Standing Committee on Public Safety and National Security (2021), cited above. Speaking in a similar vein, former Vancouver Police Board Chair Kennedy Stewart acknowledged “the existence

more independent research on the role that police discretion plays in systemic racism with respect to Indigenous people in Canada – not just in relation to the decision to arrest but also with regard to operational decision-making, the development of policing strategies, and resource deployment.

Turning to the policing of minority communities more generally and Black communities in particular, commentators have drawn attention to a lack of Canadian research on the relationship between race and police practices,<sup>105</sup> but there is evidence that race plays a significant role in the decision to stop, search, and arrest in Canada. Drawing on extensive interview data collected in 2007, for example, Wortley and Owusu-Bempah have found that when it comes to “street-level” interactions with the police – which frequently involve the use of discretion – Black people are far more likely to be stopped and searched (which also increases their likelihood of being arrested and drawn into the criminal justice system):

According to our results, blacks are over three times more likely to experience multiple police stops than whites or Asians and are three times more likely to report being searched during these police encounters. Black males appear to be particularly vulnerable to police stop and search practices. Black respondents are also six times more likely than respondents from other racial backgrounds to report that they have close friends or family members who had been a recent victim of racial profiling. Importantly, racial differences with respect to both direct and indirect police contact remain statistically significant after controlling for other relevant variables including age, income, education, driving habits, community-level crime, alcohol and marijuana use and criminal history. These findings suggest that race matters.<sup>106</sup>

## Understanding Police Discretion

Writing some ten years later, Wortley and Jung noted in their 2020 report to the Ontario Human Rights Commission that a series of other Canadian studies have also suggested that Black people are “highly over-represented with respect to certain discretionary offences.”<sup>107</sup> Although they prefaced their review of the research literature by noting that “studies that examine the impact of both offender and victim race on arrest decisions have rarely been conducted in Canada,” Wortley and Jung have pointed to the fact that Black people in Canada are more likely to be subjected to racially biased police decisions – particularly the decision to stop and search – than white people, with the result that they are also more likely to be charged with drug possession and related offences. Summarizing their own work on the role of race in the decision to arrest and charge, Wortley and Jung also have noted that their findings with respect to the Toronto Police Service (TPS) are consistent with those from similar studies across Canada:

The data presented in this report expose dramatic racial disparities with respect to TPS charge practices. In the past when faced with such statistics, police services and associations have often argued that disparity does not prove discrimination. However, in our opinion, the gross racial disparities documented by this inquiry strongly support the argument that racial bias exists and must be taken seriously.<sup>108</sup>

The relative lack of independent research studies is not the only barrier to a better understanding of the relationship between race and police discretion in Canada. As Wortley and Jung have pointed out, historically, the police and governments in Canada “have not responded well to academic and community requests for data collection and data analysis frameworks that

Kingston: Arak Publications.

<sup>108</sup> Wortley & Jung (2020), 109.

would better address allegations of racial bias.”<sup>109</sup> This problem has been compounded by the fact that many police services in Canada do not collect racially disaggregated arrest data. This problem has been highlighted repeatedly by police researchers in Canada, with Millar and Owusu-Bempah arguing that it can be viewed as tantamount to the “whitewashing” of police racism via data suppression.<sup>110</sup> Problems related to the transparency of policing data were also recently highlighted as part of an inquiry into the use of street checks in Nova Scotia.<sup>111</sup>

In addition to this research on discretionary charging and racism, a number of Canadian studies have examined the operation of police discretion in relation to young people. Fitzgerald and Carrington, for example, have noted that there is a considerable body of evidence to suggest that personal characteristics such as age and gender play a significant role when it comes to how the police make decisions with regards to juveniles in Canada.<sup>112</sup> In particular, they have pointed to Canadian studies that suggest that the police are more likely to treat younger individuals more leniently, with demeanour also being a strong additional predictor when it comes to how police discretion is used. On the specific question of the relationship between age and race, Fitzgerald and Carrington have noted that the research in this area suggests the two variables interact in complex ways:

Some research supports the suggestion that the effect of race on police decision-making may in fact be “conditional” or “interactive” in that it is “dependent on the level of other variables.” For example, in Wortley and Tanner’s (2005) study of Canadian young people, low-risk black youth were more likely to receive police attention than low-risk

## Understanding Police Discretion

white youth, but this relationship did not hold among high-risk youth. Thus, the level of DMC [disproportionate minority contact] had a negative association with the level of deviance of the juvenile. Wortley and Tanner found that similar proportions of black and white high deviance youth reported being stopped by police in the past two years (83% of blacks and 82% of whites); but among low-deviance youth, the racial difference in police stops was large and statistically significant (49% of black youth versus 17% of whites). They argued that this finding suggests there are racial differences in the extent to which “good behaviour” protects youth from police attention.<sup>113</sup>

More recently, a number of other studies in Canada have confirmed that young Black people are more likely to be the subject of police attention and receive less favourable treatment when it comes to the exercise of officer discretion.<sup>114</sup> For example, in her study of youth diversion programs in Canada, Samuels-Wortley has found that Black youth are more likely to be charged than their white counterparts, particularly when it comes to drug possession offences.<sup>115</sup> In addition, she has also found that young Black and other minority females are less likely to be cautioned than white females. After noting that “the decision to divert youth away from the justice system is based primarily on the discretion of individual police officers,” Samuels-Wortley has concluded that selection bias plays a significant role in police decision-making, leading to less favorable outcomes for minority youth:

Ultimately, racial bias may play a sufficient role in the Canadian youth criminal justice system. This study highlights that in particular, bias within policing can have a specific impact on racialized youth in Canada. Police discretion plays a significant role in who enters the court system, thus any biases may influence arrest decisions. Police should

<sup>113</sup> Fitzgerald & Carrington (2011), 456, citing Bishop, DM. acknowledge the role they may play in the overrepresentation of Black and Indigenous peoples in the Canadian youth criminal justice system.<sup>116</sup>

Returning to Fitzgerald and Carrington’s overview of the research literature, they have also drawn attention to a number of Canadian studies that suggest police in metropolitan areas are more likely to choose a formal response when dealing with juveniles.<sup>117</sup> In one of the studies referred to, for example, Jennifer Schulenberg attempted to test four prominent ecological theories of crime – urbanization theory, social disorganization theory, opportunity theory, and the overload hypothesis – with a view to better understanding how police discretion is exercised with respect to young people in Canada. Although Schulenberg has acknowledged that her study was limited in a number of important ways – particularly in terms of measuring how different theories of policing are operationalized – she has noted,

[T]he use of formal action with youth by Canadian police forces does seem to be affected by the size of the community and its level of social disorganization but not by the opportunity for crime, the actual crime rate, or the workload of the police.<sup>118</sup>

Interestingly, other studies have also suggested that the use of police discretion in relation to young people may vary between metropolitan and rural areas. For example, Schulenberg and Warren have noted that community relationships are more likely to play a role when it comes to police decision-making in rural areas:

The factors considered important by officers working in metropolitan areas suggest an offense orientation by placing more weight on the characteristics of the offense and not a victim’s preference or a youth’s personal situation. In contrast, officers in rural, small-town jurisdictions display a stronger focus on offenders and victims as these officers are

<sup>118</sup> Schulenberg (2003), 149.

## Understanding Police Discretion

the most likely to consider victim preference and the relationship between the victim and offender as a factor when compared to other officers in other community types.<sup>119</sup>

While these findings have been confirmed by subsequent studies, more recent research has shed additional light on how various personal and context specific factors influence how police discretion is exercised with respect to young Canadians in non-metropolitan areas. Based on a study of police interactions with young people in three municipalities in British Columbia, Card et al have concluded that age, gender identity, and race have a significant impact on how police discretion is exercised:

Notably, we found that gender non-binary and Indigenous participants were more likely to experience punitive measures (i.e., being handcuffed or arrested), even after adjusting for histories of drug dealing, past police encounters, and contextual factors. Younger participants were also more likely to be searched or frisked by police regardless of illegal activity or being suspected of a crime at the time of the encounter. These findings indicate that outcomes of encounters between young people and police may be discriminatory – predicated on individual’s visible characteristics, such as race, gender, and age.<sup>120</sup>

Before concluding this brief overview of the research on factors influencing police discretion in Canada, it is important to note that new lines of inquiry have begun to emerge in recent years. Notably, a number of prominent researchers have now turned their attention to the question of how police discretion is exercised in relation to persons with issues regarding mental health.<sup>121</sup> In addition, various studies and reports have also examined the role played by police discretion in the criminal justice system’s response to gender-based and intimate partner violence

<sup>119</sup> Schulenberg, JL. (2010) “Patterns in Police Decision-Making with Youth: An Application of Black’s Theory of Law” *Crime, Law and Social Change* 53(2): 109–29, 126. and sexual assault in Canada.<sup>122</sup> Unfortunately, however, it remains the case that there have been few Canadian-specific studies of the operation of police discretion in these contexts.

Considering the challenges that have faced researchers in Canada who have sought to study the role of discretion in the policing of Indigenous people, racial minorities, and young people, this is hardly surprising. It does, however, point to a persistent problem when it comes to discussions about the nature and function of police discretion in Canada: they have largely taken place against the backdrop of a profound and longstanding dearth of independent research on police behaviour at the municipal, provincial, and federal levels. When compared to countries like the United States and the United Kingdom, it is no exaggeration to say that Canada lags behind when it comes to police research, with the result that it is difficult to ensure that the development of policing practices and policies in Canada are sufficiently driven by evidence. This is a point that will be further developed in the next and concluding section.

## V. Reconsidering Police Discretion in Canada

This report has attempted to provide insight into the meaning and operation of police discretion in Canada. As is apparent from the previous sections, discretion lies at the heart of almost every aspect of policing at the municipal, provincial, and federal levels in Canada, and as a result, it is difficult to distinguish between the many factors that influence how it is exercised or how its use determines how suspects, victims, and members of the public are treated by the criminal justice system. In the Canadian context, debates about the proper role and limits of police discretion are

<sup>122</sup> Salerno-Ferraro, AC & Jung, S. (2021) “To Charge or Not to Charge? Police Decisions in Canadian Sexual Assault Cases and the Relevance of Rape Myths” *Police Practice and Research* 1–14; Fagerlund, M. ## Understanding Police Discretion

also constrained by a shortage of independent academic research on how police discretion functions in different contexts and on how the day-to-day decisions of the police impact the lives of the individuals and communities they come into contact with and serve.

Faced with these challenges, it is tempting to conclude that there is little that can be said about police discretion in Canada *generally* and that calls for reforming the way in which police discretion operates should be narrow and focused on particular contexts – such as stop, search, and arrest, or on the experience of particular groups, such as Indigenous people and their communities, racial minorities, and young people. Although there is obvious value in taking such an approach – not least because it allows us to prioritize efforts at reforming police discretion with a view to minimizing its negative impacts on already vulnerable and marginalized individuals – it would be a mistake to assume that a broader discussion of the nature of police discretion in Canada is not possible or desirable.

As section II of this report highlighted, although police discretion was first “discovered” by sociologists and criminologists over 60 years ago, our understanding of that discretion remains plagued by a lack of clarity about the source and nature of that discretion. Returning to the contrasting accounts offered by Davis and Kleinig, it should be apparent that definition matters. How we view police discretion – whether as a product of the limits of rules or as a resource granted to the police – has significant implications for the question of how we should respond to it. More significantly, clarity about the nature and operation of police discretion can help us to address fundamental questions of regulation and reform.

Writing in 2005, James Stribopoulos presented a powerful argument in favour of greater parliamentary regulation of police discretion, based in part on a critique of judicial attempts to impose effective restraints on the exercise of police powers in Canada. According to

Stribopoulos, the police perception that “the law is only remotely related to the realities of their work” was reinforced by what he referred to as a “free floating legal structure” propped up in part by a series of decisions by the Supreme Court:

[J]udicially created rules, no matter how clear they may be, cannot effectively regulate police power. Enforcement of judicially created rules depends on judicial censure, usually through the exclusionary remedy. Redress in cases where innocent individuals are unjustifiably detained, searched or arrested is quite unlikely. The fatal flaw with the Court’s use of law-making devices lies in the fact that they cannot produce the sort of procedures most needed if low-level exercises of police discretion are going to be effectively checked. In fact, by forestalling a dialogue on the subject of police powers between the Court and Parliament, judicial lawmaking actually has the unfortunate tendency of aggravating the low visibility of police–citizen abuses.<sup>123</sup>

Later in the same article, Stribopoulos went on to argue that, given the inability of judicially created rules to effectively regulate police power, Parliament must step in and enact clear rules and procedures that set appropriate limits on the exercise of police discretion:

[O]ne of the major challenges in effectively regulating police authority is the low visibility of most police–citizen encounters. Clear and prospective rules will undoubtedly help to confine and structure police discretion but will do little to actually “check” police authority. What is needed most are administrative procedures that serve to check low-level and routine exercises of police discretion—procedures such as reporting requirements, approval by senior officers for certain investigative activities or procedures, and even more independent checks (for example, where feasible, through the warrants process). Even though the Court can insist on express and legislated rules, its options seem limited where the rules create a scheme that contains insufficient procedural checks and is therefore vulnerable to systematic evasion and abuse by those acting under it.<sup>124</sup>

One of the strengths of Stribopoulos’ argument here is that it comes at the conclusion of a detailed and comprehensive analysis of the relevant Canadian case law on police powers, an analysis that highlights the institutional limits of the Supreme Court and its inconsistent approach to this issue – particularly since the introduction of the *Charter of Rights and Freedoms*. Significantly, Stribopoulos has acknowledged that his analysis relies on Davis’ definition of

## Understanding Police Discretion

police discretion, and police discretion in Canada – at least in the days before the *Charter* – has risen to the fore in situations where the legal limits of police authority are unclear.

Although Stribopoulos has made a strong case for Parliament to step in and place police powers in Canada on a clear legal footing, it would be even more compelling if grounded in an understanding of discretion more aligned with that advanced by Kleinig. Put another way, if we view police discretion as a privilege or resource granted to the police – to be used “with discretion” – then it makes even more sense for Parliament, as the source of that privilege, to provide a clear basis for its exercise and for statutory rules and procedures that circumscribe its use. All of this is to say that in order to move forward in our consideration of the role of police discretion in Canada, we should look to abandon the idea that it is something extra-legal or outside the scope of rules.

Moving to this view of police discretion – one that sees it as a normative resource that is granted rather than a capacity that is assumed – also provides a more coherent basis for conversations about both oversight and limitations in certain contexts. If we start from the position that police discretion is conferred and is therefore a legitimate, legally bounded exercise of authority, then it becomes easier to justify efforts to subject that discretion to oversight and review. This model would also represent a fundamental challenge to the view often held by police officers that discretion is an unavoidable, extra-legal necessity that makes it possible for them to do their job (and as such, efforts to restrict it should be resisted). Police discretion may well be necessary and desirable but only insofar as it is granted by express mandate – and therefore subject to meaningful review. Returning to Kleinig’s analysis,

Discretionary authority may be granted in advance, within the limitations mandated by laws, regulations, and supervisory determinations. And particular exercises of that discretion, like exercises of judicial discretion, may be open to public review and discussion. As long as this is so, such discretion has every claim to be part of a democratic order. The “rule of law, not of men” is directed against arbitrary exertions of

power, not against discretion. Discretion, as a normative resource, is a form of decision-making power that is embedded in a rationale, and although that may not be sufficient to justify its every exercise, it is to be firmly distinguished from action based on personal preference. That authority may, as a result of public scrutiny, be broadened or narrowed via legislation, judicial review, or administrative rule making. As with the previous objection, the crucial issue regarding the democratic conformity of police discretionary authority will concern its limits rather than its general legitimacy.<sup>125</sup>

Before concluding this report, it is important to draw attention to two fundamental problems that should be key considerations for any policymakers, legislators, or police managers tasked with reforming the operation of police discretion in Canada. The first of these is the vague and incomplete language around police powers contained in the majority of provincial and federal policing statutes. As discussed in section III, there is considerable variation in how the police role – and the powers and duties that go with it – is framed in different parts of Canada, which has only contributed to a lack of clarity about the nature and limits of police discretion. Finally, it cannot be over-emphasized how the lack of independent research on police discretion hampers informed debate about the future of that discretion. Despite the considerable efforts of a small number of academic lawyers, sociologists, criminologists, and police scholars in Canada, there are major and disturbing gaps in the research literature when it comes to how police discretion functions, particularly in relation to Indigenous communities and the police response to serious crimes of violence against women.

As has already been noted, some of these gaps can be attributed to a lack of funding and the difficulties associated with obtaining criminal justice data. However, in many respects the problem derives from a more fundamental problem – a lack of engagement on the part of police services in Canada with academic research. As many commentators have noted, gaining access to police organizations – for the purpose of interviewing and observing officers – is extremely

## Understanding Police Discretion

difficult in Canada. Speaking before the Standing Committee on Public Safety and National Security in 2013, Griffiths highlighted the particular challenge of developing ongoing research relationships with the police:

[O]ur research endeavours with respect to policing in Canada are scattered, and there is no coordinating effort. There are very few linkages among universities, governments, and police services. Research is often being done on a one-and-done basis, whether it's by private consulting companies such as KPMG or by university-based scholars who work on a single type of project and then move on. We really don't have a coordinating body. We really don't have a repository, if you will, for police research, and an organization, agency, or institute that could serve as a catalyst for facilitating these collaborative relationships, and equally as important, for the dissemination of information.<sup>126</sup>

While this is a problem for the development of independent research on policing generally, it is particularly problematic when it comes to the study of police discretion. Studying arrest statistics and patterns of incarceration can only take us so far. If Canada wants to move to a position where decisions about how to regulate police discretion are driven by evidence – and a deeper understanding of how decisions are *actually* made – then researchers need to have access to officers. Going further, this access needs to be provided at all levels of our police services. Although a great deal of police power is exercised at “street level,” discretionary decisions are made at every level of the police organizational hierarchy. If we are to seriously address many of the issues concerning the exercise of police discretion identified in this report, then police services need to be willing – or possibly compelled – to engage with independent researchers. Moreover, government needs to be willing to properly fund this research – not just on a piecemeal basis but as part of a larger commitment to police accountability and ensuring that police powers are exercised in a manner that is consistent with the rights and values expressed in the *Canadian Charter of Rights and Freedoms*.

<sup>126</sup> Standing Committee on Public Safety and National Security (2014), 42. A number of prominent Canadian police scholars attempted to address this problem by establishing the Canadian Society of Evidence-Based Policing (CAN-SBP) in 2015. See the CAN-SBP website, <https://www.can-sebp.net/>.

## **I. Introduction: Security Networks, Interoperability, and Crisis Response**

In the aftermath of any mass casualty event, it is instructive to consider the factors that either facilitated or hindered interoperability between the police and other agencies that responded to the crisis. This report discusses the concept of interoperability with a specific focus on the factors that contribute to or hinder effective interorganizational communication and decision-making during emergencies. In addition to looking at the ways in which these issues play out in Canada, this report discusses relevant cases in the United Kingdom, United States, and Australia to illustrate the consequences of a lack of collaboration between investigative agencies and formal interoperability initiatives.

Police, fire and rescue services, and ambulance services are responsible for responding to a wide variety of emergency situations, both nature- and human-related (Power & Alison 2017: 243). Major crises can unfold over the course of hours, days, weeks, months, or years. The active shooter incident in Moncton, NB in 2014, which resulted in the deaths of three RCMP officers and injuries to two other officers, lasted over 28 hours. The mass casualty event in Nova Scotia unfolded over a period of 13 hours on April 18–19, 2020 and resulted in the deaths of 22 persons. Incidents can be complex, time sensitive, and unpredictable (Hine & Bragias 2021: 1493). Active shooter incidents can occur without warning and escalate rapidly in terms of the number of persons at risk and the area covered, thus presenting serious challenges to the police and other first responders:

Police cannot be sure of what or who to expect upon arrival at a scene or the level of assistance they may encounter; there may be innocent bystanders or multiple offenders involved; they are high-stakes events that may result in serious consequences and the police are typically under time pressure to resolve the situation before it escalates. At the same time, officers need to make critical decisions about how to respond. Officers need to decide how to prioritize the multiple duties that are required and consider potential outcomes (Hine & Bragias 2021: 1493–94).

## Interagency Communication, Collaboration, and Interoperability

The following discussion considers the various dimensions of interoperability during major crises and the challenges and opportunities that exist in developing effective multi-agency networks. Of particular interest are the relationships between agencies that have a security mandate (Whelan 2011; Whelan 2012). These include what are often referred to as “blue light” organizations: police, fire and rescue, and ambulance services (Charman 2014).

Two key concepts in such discussions are *interoperability* and *security networks*. Interoperability, which will be discussed in further detail below, refers basically to the ability of different systems to connect and exchange information with each other (Gottschalk 2009). The term “security network” refers to those agencies in a jurisdiction that have a mandate to provide frontline, first responder services to protect the safety and health of the community. As Whelan has observed, “The practice of security is multifaceted” (2016: 311). Security networks can therefore be viewed as “deliberately structured platforms whereby agencies are required to work together to achieve their own goals and also a collective goal” (Whelan 2016: 311).

Other terms that are closely related to each other and merit defining here include “crisis” and “critical incident.” A “crisis” has been defined as an event or series of events that

... significantly disrupts normal operations, has caused or is likely to cause severe distress or have severe consequences for individual staff or organisations, and requires out of ordinary measures to restore order and normality, thus demanding immediate action from senior management... A crisis may be precipitated by a critical event (Buth 2010: 4).

A critical incident, on the other hand, is more narrowly defined as “an event or series of events that seriously threatens the welfare of personnel, potentially resulting in death, life-threatening injury or illness” (Buth 2010: 4).

Various critical incidents and major crises “require different skills and approaches of police in controlling and managing the successful outcomes” (Hine & Bragias 2021: 1493).

Large-scale crises require police services, fire and rescue, and emergency medical services to

## Interagency Communication, Collaboration, and Interoperability

work effectively together, along with municipal, provincial/territorial, and federal agencies. It has been noted that “Being able to effectively work alongside and communicate decisions with [a] vast array of personnel with differing goals can become difficult, especially given the environment in which they need to work” (Hine & Bragias 2021: 1493; Bonkiewicz & Ruback 2012). The environments of major crises are often complex and may involve high levels of ambiguity and uncertainty, and critical incidents are by nature time-sensitive (House, Power, & Alison 2014). “The diversity and demands encountered when responding to major incidents may transcend the capabilities of any one individual; their effective management requires the collective and coordinated activities of several individuals and groups” (House, Power, & Alison 2014: 329; see also Axelsson & Axelsson 2006; Drucker 2007). Effective responses therefore require a complex and multifaceted approach. Yet the extent to which police, fire and rescue, and emergency medical services train on interoperability, practice simulations, and have integrated policies and operational plans varies across jurisdictions.

While the notion of interoperability as the ability of organizations to work together seems simple, “the capacity of distinct and unique systems to communicate with one another effectively has always been a challenge in public safety...” (Piett 2021: np; see also Perez et al 2017). Piett has observed:

When systems aren’t interoperable, disjointed response efforts and information gaps persist, both of which can cost time and, in dire circumstances, lives. Without interoperability, key information remains siloed, leaving decision-makers in the dark. Response teams have limited visibility into the status of victims or how others are reacting to emergency events as they unfold (Piett 2021: np).

There are several dimensions of interoperability, including technical, organizational, and relational (human and agency) (Pollock & Coles 2015: 8). Many situations or initiatives are referred to as “multi-agency,” but this term is purely descriptive, referring to multiple organizations working for the same outcome but potentially in parallel with each other. An *inter-*

## Interagency Communication, Collaboration, and Interoperability

*agency* relationship, on the other hand, implies that two or more agencies effectively penetrate each other's working practices (Charman 2014: 105). In other words, inter-agency relationships center around interoperability. Critical incidents in international contexts and in Canada have demonstrated

... the dilemmas associated with multi-agency working and the extent to which multi-agency working does or does not become inter-agency working, i.e. the extent to which agencies operate in a coordinated and cohesive manner.... Interoperability constitutes in effect inter-agency working at the front end of services that rely on coordinated activities between different agencies and professions. (Charman 2014: 103).

## II. Inter-agency Dynamics and Interoperability

The components of security networks in any one jurisdiction may be easily mapped; but it can be difficult to know how the agencies in the network work together and the factors that facilitate or hinder collaboration. A key question that often emerges from the challenges regarding interoperability in blue-light organizations is "Who should assume the leadership of integrating the organisations?" (Wankhade & Patnaik 2019: 130). In addressing this question, there are several structural and relational issues that must be considered:

Structural properties include such attributes as the design, size and level of goal-consensus between network members... Relational properties refer to the relationships between actors or network members... Analysts usually focus on the "formal" relationships. "Informal" relationships are also important, not only in terms of the ways in which they shape formal relationships but because these "social networks" are often the way work really gets done (Whelan 2016: 312; see also Zaheer, McEvily, & Perrone 1998; Cross & Parker 2004).

The role of interpersonal relationships in interoperability is discussed below.

In addition to the formal and informal relational dynamics of a security network, Whelan (2016: 313) has noted that there are both endogenous and exogenous factors that can affect how a security network performs. In discussing high-risk, high-impact contexts, Alison, et al. have described endogenous uncertainty as:

## Interagency Communication, Collaboration, and Interoperability

... uncertainly about the problems. It may include incident-specific environmental characteristics such as ambiguous information, intensive time pressure and risk, all of which can induce doubt in decision makers, e.g., “What are we dealing with and what are the risks?” (Alison et al 2015b: 1311)

In contrast, exogenous uncertainty stems from:

... ambiguity about the operating system that is responding to the decision problem and may include issues affiliated to the management of the problem and associated team processes. Exogenous uncertainties can derive from confusion over the expectations of one’s own and others’ behaviour. This can compromise the effectiveness with which teams plan and ultimately execute decisions and actions (Alison et al 2015b: 1311).

While a well-organized network should be able to manage the exogenous factors, less control may be exercised over endogenous factors. Research has found that in critical incident settings, exogenous uncertainty may be significantly greater than endogenous uncertainty (Alison et al 2015b). The stressors of endogenous and exogenous factors in responding to a critical event are discussed later in this report.

#### **A. The “3 Cs”: Cooperation, Coordination, Collaboration**

Pollock and Coles have noted, “Effective management of major incidents requires responder organizations to operate beyond their ‘normal’ scope of duty and instead act as a collaborative network” (2015: 4). But as Whelan (2016) has pointed out, collaboration cannot be achieved merely by forming a network. Many factors affect the interoperability of a security network, including the presence or lack of trust between parts of the network and practiced routines of information exchange and partnership. In short, having an action plan or strategic plan is in itself not sufficient to produce collaboration.

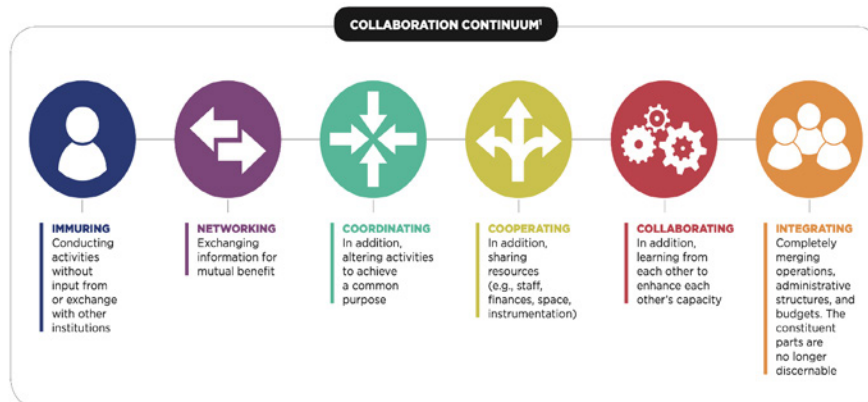

Whelan (2016) has argued that “strong, high-performing networks will be based more on collaboration than cooperation or coordination” (325) but has also noted that the concepts of cooperation, coordination, and collaboration are often used interchangeably, without being clearly defined (313). It can be instructive to think of cooperation, coordination, and

## Interagency Communication, Collaboration, and Interoperability

collaboration as a spectrum, with cooperation at one end and collaboration at the other. With this understanding of “the 3 Cs,” the performance of a security network increases as the network’s attributes move from cooperation to collaboration (Whelan 2016: 310). At one end of the spectrum, cooperation involves sporadic interaction between agencies (e.g., a discrete joint investigation), while coordination involves two or more agencies adapting and aligning their policies to improve the overall effectiveness of the security network. Collaboration, at the other end of the spectrum, entails a more in-depth, strategic approach to a shared policy framework and, in its most robust form, involves integration (Keast, Brown, & Mandell 2007).

The collaboration continuum has been expanded to include additional components, as depicted in **Figure 1**. This continuum spans from agencies being isolated from one another to being fully integrated. As a security network moves up the continuum, there is a greater chance of achieving common goals, including ensuring the safety and security of the community in critical incident cases.

*Figure 1: The Collaboration Continuum*

Source: D Mashek. 2015. “Capacities and Institutional Support Needed along the Collaboration Continuum,” presentation at Claremont Colleges (June 2015), citing AT Himmelman. 2002. “Collaboration for Change: Definitions, Decision-Making Models, Roles, and Collaboration Process Guide.” Himmelman Consulting (January 2002).

## Interagency Communication, Collaboration, and Interoperability

The degree of interoperability between police services and between the police and other emergency services will be affected by the location of a particular jurisdiction on the continuum. However, the extent to which cooperation/coordination/collaboration is required will vary depending upon specific contexts. As Whelan has noted, “It is not necessarily the case that one approach works best all of the time. There may be times where cooperation is all that is required” (Whelan 2016: 314). The nature and extent of collaboration that is desirable and feasible are variable across jurisdictions, due to several factors, including funding issues and inconsistent messaging from government departments: “Amongst the complexities identified for services in achieving effective collaboration is the multifaceted line of responsibility locally and nationally” (Kane 2018: 81). This is reflected in the development of national frameworks, including the Canadian Interoperability Communications Action Plan, led by the federal government with the participation of the provincial/territorial governments (Public Safety Canada 2011; Public Safety Canada 2013).

Observers have noted that there is often a disconnect between discussions of collaboration at the strategic level of organizations on the one hand and its implementation at the operational level (Berlin & Carlstrom 2011; Pollock & Coles 2015). As mentioned above, a key question for any security network in this regard is: which organization is to assume the leadership role? Whelan has suggested that “rather than view a lead organization as *controlling* the network, we can view leadership in terms of coordinating the activities of others in a way that maximises efficiencies and is supported by network members” (2016: 319). Similarly, Pollock and Coles have stated:

Collaborative networks are ideally characterized by reciprocity, representation, equality, participatory decision making, and collaborative leadership... The success of such networks depends on the ability of their leaders to organize structures, resources, and interactions when bringing together participants with different authority, motivations,

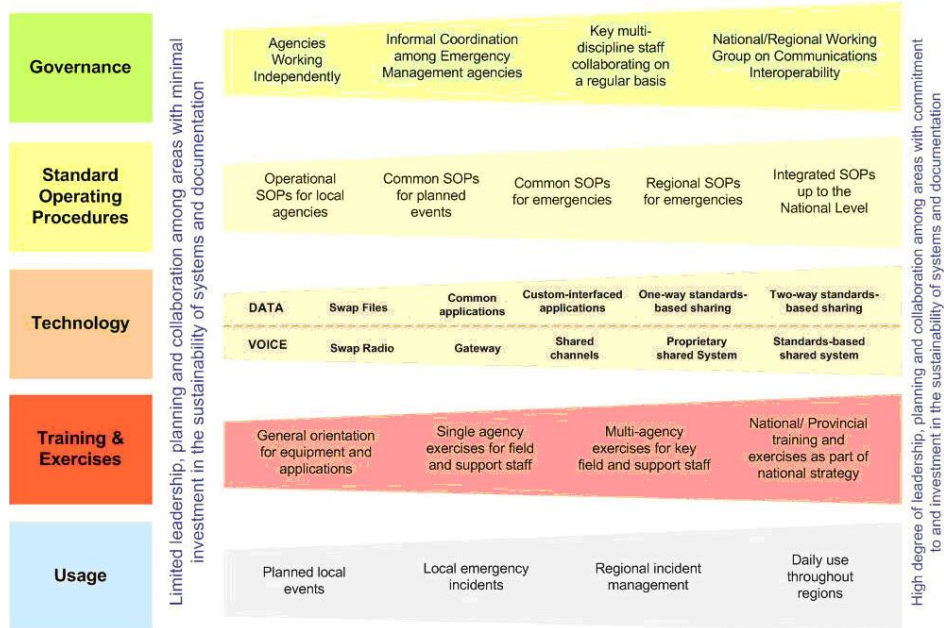

Interagency Communication, Collaboration, and Interoperability

interests, skills, and access to information (2015: 4; see also de Leon & Varda 2009; Moynihan 2005).

**B. Interoperability in Canada**

The Communications Interoperability Strategy for Canada includes a framework for understanding the key components of communications interoperability (**Figure 2**). Note that this schematic was based on the one developed by SAFECOM and the US Cybersecurity and Infrastructure Security Agency (2021: 2).

*Figure 2: Canadian Communications Interoperability Continuum*

Source: Public Safety Canada, "Communications Interoperability Strategy for Canada" (2011) 12.

In 2018, the federal/provincial/territorial (FPT) Ministers Responsible for Emergency Management acknowledged the importance of a "reliable, modern, nationwide and interoperable public safety broadband network (PBSN) ... [that could] be used by emergency responders and

## Interagency Communication, Collaboration, and Interoperability

public safety personnel to communicate with each other, share and access information during day-to-day operations, weather-related incidents and natural disasters, emergencies and major events” (Public Safety Canada 2022: i). A Temporary National Coordination Office (TNCO) was established. Partners in this endeavour include the federal, provincial, and territorial governments, as well as the non-government sector (e.g., the Canadian Association of Chiefs of Police, the Canadian Association of Fire Chiefs, the Federation of Canadian Municipalities, and the Paramedic Chiefs of Canada). Consultations with stakeholders were conducted across the country, and research was conducted to inform the preparation of a national plan. The principles for the PSBN, which were presented by the TNCO to FPT governments in early 2022, include: 1) interoperability; 2) equitable service; 3) affordability; 4) sustainability; 5) coverage; 6) delivery of mission critical services; 7) network service always; 8) security; 9) resiliency and robustness; and 10) use of spectrum (Public Safety Canada 2022: ii–iii).

Nova Scotia has been a participant in the interoperability initiatives organized by Public Safety Canada and was one of the first provinces to have a province-wide trunked mobile radio (TMR) system in place for all public safety organizations using the 700mhz bandwidth. This was in place as of 2015 and is known as TMR2 (according to personal communication with NS law enforcement official; see also Rock Networks 2015). Since that time, there have been eight provincial mutual aid channels available to all radio users (police, fire, emergency health services (EHS), Valley Communications, which dispatches for nearly all of the volunteer fire services in the province, as well as servicing as a 911 Public Safety Answering Point (PSAP), search-and-rescue (SAR) volunteers, the military, border services, hospitals, etc.) to facilitate collaboration and coordinated responses to significant events. These channels are in addition to some shared encrypted channels restricted to use by law enforcement in the province. This work

## Interagency Communication, Collaboration, and Interoperability

on coordinated radio systems has progressed to include Prince Edward Island (which uses the Nova Scotia system) and New Brunswick, which has now implemented TMR2. There are now at least two common channels available throughout the entire geographic area of the three maritime provinces. In effect, the trunked system allows a Halifax Regional Police portable to work in Charlottetown and vice versa. There are five dispatch points in Nova Scotia capable of controlling and assigning the various radio channels for use: the provincial Integrated Emergency Services (IES), the RCMP Operational Communications Centre (OCC), Emergency Health Services (EHS), Cape Breton Centre, and Shubie Station for the provincial government Emergency Management Office (EMO). There is information-sharing between these centres through the provincial 911 system, which includes overflow protocols.

### **C. The Important Role of Communication During Major Crises**

A central issue for agencies in emergencies is communications, which has been described as “a process through which an organization sends a message across a channel to another part of the organization (intraorganizational) or to another organization in the network (interorganizational communication)” (Kapucu 2006: 209). As Kapucu has noted, however:

Creating an effective communication network for emergencies is a challenge because it may conflict with the organizational structure developed during routine times. When the information is simple, a bureaucratic system functions better. Most of the time, information in emergencies is complex (Kapucu 2006: 211–12).

Buth has observed, “Time is of the essence in crisis response... Robust communications protocols...are key to ensuring that the occurrence of an incident is communicated to relevant managers without delay. The quality of information shared is as significant as the speed of information flows” (2010: 7). As well, “To act effectively in disaster situations requires sharing and using information effectively: collecting, collating, analyzing and then deploying it promptly

## Interagency Communication, Collaboration, and Interoperability

and in a useful form” (Kapucu 2006: 208). This information-sharing must be across organizational boundaries and must often occur quickly. This is particularly the case in a dynamic environment in which a crisis is unfolding rapidly, where there may be a high degree of uncertainty about the plan and objectives of perpetrators, and/or victims are being randomly targeted. Inadequate sharing of information may result in resources being inefficiently used and/or work being unnecessarily duplicated (Kapucu 2006: 211). The extent to which the flow of information is effective thus plays a major role in the ability of agencies to respond to a crisis: “If responders are not in contact with each other and if information does not flow properly, it is hard to envision successful crisis and disaster management” (Kapucu 2006: 209; see also Hine and Bragias 2021).

Additional challenges exist when personnel from multiple agencies who are responding to a crisis are in dispersed locations. Strategies must be employed to overcome traditional communication constraints (Rice 1990: 99).

Environments characterized by uncertainty and rapid change present different constraints and opportunities on organizations than do stagnant and stable environments. An extreme event or a disaster challenges the capabilities of routine communication systems whose natural constraints may be acceptable in “normal” times (Kapucu, 2006:210).

For these reasons, it is important that interoperative communications arrangements are “established as part of standard operating procedures so when critical events occur, the protocols and processes for an effective response are [already] in place” (Kane 2018: 84). The US Cybersecurity and Infrastructure Security Agency (2019) has produced a best practice guide to improving emergency alerts, warnings, and notifications (see also Hawkins 2013).

While communications within a security network is a critical issue, communications with the public is also an important component of emergency management. Lamberti has noted, “The elements of crisis communications during an incident include controlling messages related to the

## Interagency Communication, Collaboration, and Interoperability

police response, meeting the physical and psychological needs of the community, and having the ability to send messages with minimal oversight” (2016: 68). However, traditional command hierarchies and departmental rules about access to sensitive material or mission-related details can sometimes impede the quick dissemination of information: “Messages routinely go through layers of hierarchy for approval before being released to the public. That lengthy approvals process could make crisis communications irrelevant... Timeliness in crisis communications is critical” (Lamberti 2016: 63). Social media can therefore play an important role during a crisis, especially for quick holding messages, such as “we’re aware of the incident,” “please stand by and be patient with us,” and “we provide more information as soon as possible” (Lamberti 2016: 58).

Studies of the effectiveness of communications within and between emergency service agencies in major crises have found that there is better information flow in decentralized decision-making models: “in crisis situations, it is typically the frontline response personnel who are closest to the incident, that have the most up-to-date and accurate understanding ... of the situation” (Hine and Bragias 2021: 1504). A boundary spanner is a person in an organization whose role is to link the organization with the external environment and thereby facilitate interagency relationships, using information gathered from first responders (Williams 2002). Boundary spanners, especially those with frontline experience, can be an effective means for improving communication among multiple personnel and agencies.

For a best practices guide to communications and interoperability, see the report of the US National Public Safety Telecommunications Council (2018).

#### **D. Organizational and Occupational Cultures and Interoperability**

What you want to achieve is a “network culture.” That is to say, all players have to understand why they are in the network, where they fit in the network, what their contribution is, and how important their contribution is. . . in order to give meaning to their activities (former senior official from a security intelligence agency, quoted in Whelan 2016: 320).

Discussions of interoperability tend to focus primarily on communication systems, and little attention has been given to strategies for creating and sustaining professional and cultural interoperability (Wankhade & Patnaik 2019: 133). But features of an organization’s culture can either facilitate or hinder collaboration (Yang & Maxwell 2011), and cultural interoperability among agencies can therefore be as important as technical and information-based interoperability (Charman 2014: 103). As Kane has put it, “Emergency interoperability . . . is as much a social process as a technological one” (2018: 82).

The culture of an organization generally refers to “a system of shared assumptions, knowledge, attitudes, values, and norms that explains the way organizational members collectively think and behave” (Cohen 2018: 888). Thus, Charman has noted, “It is in a better understanding of the social dynamics of an organization, how its employees think, operate, learn, and feel which can reveal far more about the inner workings and the potential failings of an organization” (2014: 104). Research has found that personnel who work in agencies where the organizational culture promotes values of mutual interests, fairness and common purpose are more likely to develop and maintain long-term collaborative relationships (Kim & Lee 2006). Studies that examine first responder organizations in particular have found that transformations in organizational culture can enhance interoperability (Jacobs & Keegan 2018; Granter et al 2019; Ward & Winstanley 2006). The culture commonalities among agencies have been described as the “glue” that binds agency networks (Sabatier 1993: 27).

## Interagency Communication, Collaboration, and Interoperability

However, as Stephenson has pointed out, traditional blue-light agencies have historically had separate identities and cultures: fire and rescue services are very regimented and have strong norms of command and control; police services work in small teams that may be siloed from one another; and ambulance personnel work either solo or with one other partner (Stephenson 2015: 108). These long-established working cultures may have emerged to facilitate the achievement of specific organizational goals but may hinder the development of collaborative inter-agency partnerships. For example, even though technological innovations should improve the technical side of communications systems, the differing cultural attributes of the police, fire and rescue, and emergency medical services may limit their effectiveness in multi-agency contexts.

Cultural barriers between individual police services, as well as between police services and other emergency services, have been found to hinder collaboration, interoperability, and the effective response to threats to community safety and security (LePard 2010; Oppal 2012). Moreover, cultural fragmentation may encompass not just variations across agencies but also segmentation in ranks within an agency and divergent leadership styles, all of which may hinder collaboration among public safety agencies (Cohen 2018: 886). As Whelan has noted,

The strength of any particular group's culture will depend upon many factors such as the length of its history, the stability of its membership and the types of experiences its members have shared. Culture is likely to have a profound impact on the extent to which collaboration takes place in networks. This is particularly true of security networks (2016: 315).

Sanders (2014) conducted an ethnographical study of how members of the police, fire, and EMS in one rural and one urban jurisdiction interacted with their technologies and the ways in which "their respective organizational contexts, cultures and practices shape technological functioning and collaborative action ... during multi-agency incidents" (464). Among the findings was a disconnect between how technologies were designed to function and their application:

## Interagency Communication, Collaboration, and Interoperability

The varying social work ideologies within emergency response ... have influenced access to emergency technologies and their stored information and in turn, have created an ideological disconnect between how these technologies were designed to function and their in-situation application (Sanders 2014: 472).

Sander's conclusions supported the findings of Vaughan (1999) that organizational contexts shape emergency responders' actions, which have an "irreducible and emergent effect on the way complex information is transmitted, communicated, processed and stored" (916).

Appropriate technology can play a significant role in facilitating interoperability, but over-reliance on technology alone to the detriment of other organizational factors can hinder information-sharing (Whelan 2016: 322). Both the potential and the limits of technology must be considered by individual first responder agencies and by security networks, as noted by Voss and Andersoon (2019): "Developing the technical, economic, and governance structures that are needed to revolutionize data-sharing technology use for public safety likely cannot be accomplished by individual agencies working in isolation" (2019: i). Among the questions that should be asked are: What are some of the specific challenges regarding technology and interoperability? What are some examples of these challenges in real-life crisis response? Are there strategies for maximizing technology? Are there any official or recommended guidelines that specifically address technology?

Studies have examined the degree to which variations in the type of agency, the segmentation in ranks within agencies, and leadership styles may hinder collaboration among public safety agencies (Cohen 2018: 886). A case study of operative emergency management in two Norwegian counties identified several major organization, leadership, and individual barriers that limited or hindered effective communication within and between the emergency response organizations (Gilja 2013). Organizational barriers included a lack of training, lack of knowledge about other organizations' capabilities and requirements, and inadequate notification procedures;

## Interagency Communication, Collaboration, and Interoperability

leadership barriers included inadequate incident command and underestimating escalation potential; and at the individual responder level, stress and the lack of requisite skills were barriers (Filja 2013: 68). Moreover, the perception of differences in internal culture may lead individuals to feel that they are driven by different purposes and different organizational goals, as seen in this statement by a member of the Australian Federal Police:

There are a number of cultures inside networks... [I]f you are looking in a policing context, the [Australian Federal Police] and the Victoria Police are basically policing organisations ... but our cultures are different; if you are inside the AFP and the VicPol, you can see there are cultural differences between the organisations (quoted in Whelan 2016: 320).

Strategies to mitigate the hesitancy of first responder agencies to share information, including intelligence, must aim to break agencies out of their respective occupational/cultural silos. It has been noted that, “The three main blue-light services have separate identities and cultures”: fire and rescue services are very regimented and have strong command and control; police services work in small teams that may be siloed from one another; and ambulance personnel work either solo or with one other partner (Stephenson 2015: 108).

The organizational culture of police agencies has been extensively documented, showing that the occupational culture of policing is widely shared among police agencies (Griffiths 2020). Ingram, Terrill, and Paoline (2018: 782) have noted that there are collective effects of police culture that may affect the behaviour of individual officers: “Culture is an emergent phenomenon that originates in officer attitudes, becomes shared, and then manifests at a higher level.” As Charman (2014) has also noted, “Individual occupational cultures have strong impacts on their members” (116).

Less attention has been paid to fragmentation among police agencies due to their respective organizational cultures (Cohen 2018). There may be factors that contribute to

## Interagency Communication, Collaboration, and Interoperability

disconnects between police agencies and these can interfere with collaboration and interoperability.

Given the strong and unique cultural practices of the RCMP, municipal police agencies of various sizes, fire and rescue services, and emergency medical services, moving from a multi-agency mindset to a genuine inter-agency approach is a challenging enterprise. Research studies have found that communication between personnel in the three agencies is a key to developing an inter-agency approach (Charman 2014: 114). There are instances in which, under time pressure and the seriousness of the incident, communication between agencies may decrease and the focus is on intra-agency information sharing (Alison et al 2015a).

### **E. Interpersonal Relationships, Trust, and Interoperability**

It is impossible to create a truly collaborative network without there being interpersonal or inter-organisational relationships based on a high degree of reciprocity and trust (Whelan 2016: 323).

Networks are all founded on human beings who have a whole range of strengths and weaknesses... I could have the best structure, I could have the best model, I could have everything in the system be the best, but if I am not plugging in compatible people who have different types of strengths and weaknesses and can actually deliver as a collective, I am still not going to get the right outcome (Australian Federal Police officer, quoted in Whelan 2016: 324).

In a discussion of the importance of informal relationships to achieving the goals of a network, Whelan (2016: 323) has stated: “It is well established that a crucial amount of work gets done through informal networks based on interpersonal relationships. Reciprocity and trust may be as or more important than technology in facilitating and sustaining security networks and interoperability. Whelan’s conclusions are based on twenty in-depth interviews with “senior members of security, law enforcement and intelligence agencies” in Australia (2016: 316). The topics explored in the interviews included the interviewee’s perceptions on the important factors in network operations and “what makes them operate effectively” (317). This was followed by

## Interagency Communication, Collaboration, and Interoperability

more specific questions on “the structural, cultural, policy, technological and relations levels of analysis to better understand these network dynamics” (317).

House, Power, and Alison (2014) have noted that, “In order to execute plans, agencies in an interoperable environment must trust one another in order to be willing to take risks and follow commands from one another” (325). Similarly, Palttala et al (2012) have noted that effective communication requires uniform decision-making and good structures of collaboration. Trust among and between blue light services is a prerequisite for an effective response to major crises (Kapucu 2005).

The process of building trust among blue light services is best done prior to a collective response to a crisis (Kapucu 2006: 210), “because knowledge, routines, and communication practices cannot change overnight” (Laufs & Waseem 2020: 11). As Dynes and Tierney (1994: 150) have noted, “The best predictor of [organizational] behaviour in emergencies is behaviour prior to the emergency.”

Analysis of the responses of agencies to natural disasters, air crashes, terrorist acts, and other major crises have found that communication errors are often due to social rather than technological factors (Dynes & Quarantelli 1976; Charman 2014; Granot 1999). Two case studies from the United Kingdom illustrate this point:

The inquest into the deaths of 12 people at the hands of gunman Derrick Bird in Cumbria in the north of England in 2010 brought into focus once more the difficulties that the emergency services face in providing medical and protective services during major incidents (Chesterman, 2011). Despite 13 ambulances, 3 helicopters and 4 rapid response cars being available, some were not permitted to go further into the danger area for fear that the gunman was still present. One victim remained untreated for almost nine hours. The police were unaware of ambulances standing nearby to the scene. This lack of awareness and communication between different emergency services was not unique to Cumbria (Charman 2014: 101).

A coroner’s inquest into the deaths of 52 people who died in terrorist attacks in London on 7 July 2005 again revealed the problems of communication, lack of awareness of the roles of other members of the emergency services, and indeed outright hostility. Reports of angry clashes between ambulance staff and firefighters at Aldgate tube station on the

## Interagency Communication, Collaboration, and Interoperability

morning of 7 July have been well documented (Charman 2014: 101–2); see also Wainwright, 2011).

These problems most often arise due to issues of trust and conflicting agency goals (Garnett & Kouzmin 2007). In such cases, agencies tend to focus on their own mandate, resulting in inefficient interoperability (House, Power, & Alison 2014).

As previously mentioned, boundary spanners – organization members whose role is to link their organization with external environments – can facilitate interagency relationships (Williams 2002) by using information gathered from other first responders to build bridges and make more effective decisions. These horizontal connections can supplement formal relationships that are based on positions. Whelan (2016:316) has noted that there are informal personal relationships between organizations based on interpersonal trust, and organizational networks that are based on formal relationships between agencies. Both are necessary.

#### **F. Access to Information**

“Effective decision-making requires access to timely and relevant data” (Voss & Anderson 2019:

1). The importance of access to information, information-sharing, and integrated data systems among responder agencies was noted by an Australian Customs and Border Protection Service Officer:

When there are risks out there everyone needs to be able to have access to information because they might be the member of the group or the member of the network that has the answer that others are looking for... No one agency in that network has the ability to understand the capabilities of the whole system” (quoted in Whelan 2016: 318).

However, “[T]he collection and analysis of any type of threat information can only be successful when it reaches the public safety officials who need it most, and local agencies should insure that information sharing for intelligence purposes is truly a two-way street” (McLellan & Johnson 2018: 3). Voss and Anderson (2019) have therefore noted, “To make the firehose of data

## Interagency Communication, Collaboration, and Interoperability

potentially available to first responders timely, relevant, and usable, public safety agencies and technology developers need to collectively address the technical, economic, and governance challenges...” (1).

While there are often indications that agencies generally agree on the importance of information-sharing, studies have found that agencies are often primarily “concerned with obtaining information rather than providing information” and tend to focus on their own areas of interest rather than that of the collective, which results in inefficiencies in the response to major crises (Hine & Bragias 2021: 1503). Like trust-building, effective information-sharing is not something that can be relied upon to occur spontaneously when it is most needed. Instead, it needs careful planning and practice: “Agencies need to make careful decisions about the who, what, where, when, why, and how of data sharing *before* a multi-agency incident occurs” (Voss & Anderson 2019: ii). Barriers include competing organizational requirements, concerns regarding resources, and professional identity (Kane 2018).

### **G. Memoranda of Understanding**

To assist in planning for and fostering a collaborative security network that accounts for differing organizational cultures, effective interpersonal relationships, and reliable access to information, partner agencies often enter into agreements with one another. For example, memoranda of understandings (MOUs) are “non-legally binding arrangements used to describe the terms under which the RCMP cooperates with its partners” (RCMP 2019: 3). These partners may include other police services and levels of government and provide a framework for sharing information, cooperation and collaboration on projects, and sharing equipment, personnel, or agency property (RCMP 2019). MOUs are a method for facilitating and continuing intersectoral collaboration (Damari, Rostamigooran, & Farshad 2019).

## Interagency Communication, Collaboration, and Interoperability

Researchers have found that there are often issues in the drafting and implementation of MOUs (Damari, Rostamigooran, & Farshad 2019). In constructing MOUs, “Special attention should be given to liability, responsibility, accountability, and the role that agencies will play when the agreement is activated” (McLellan & Johnson 2018: 2). However, there are very few standard templates for drafting MOUs, and some MOUs are designed without consulting all stakeholders, which can result in very little actual take-up. The challenges of implementing MOUs include a lack of experience in joint planning, bureaucratic obstacles in the participating agencies, a lack of support from senior leadership, inadequate budgets for implementation of MOU provisions, and a lack of understanding of MOU objectives (Damari, Rostamigooran, & Farshad 2019: 172). Damari, Rostamigooran, and Farshad have therefore cautioned, “MOUs can facilitate communication with the right persons in other organizations and strengthen the interaction between organizations ... [but] implementation requires strong determination; and generally serious issues cannot be solved by signing an MOU” (2019: 173).

RCMP MOUs are not legally compulsory and do not involve the exchange of money. The challenges surrounding RCMP MOUs were highlighted in an internal audit conducted by the RCMP in 2019 to examine “whether the use of MOUs is consistent with applicable policy requirements within the RCMP” (RCMP 2019). The audit findings included:

- A majority of MOUs were missing key mandatory clauses required by [RCMP] Policy and contained limited financial information.
- Reviews of MOUs were not conducted systematically, and approvals were not always performed at the required level.
- There was no central oversight function in place to ensure that MOUs were respective of core elements of Policy and were aligned with RCMP priorities; and
- There was a general lack of knowledge surrounding contractual arrangements and the approved authorities that applied to them, which increased the risk of exceeding the authorities (RCMP 2019: 3).

Overall, the audit concluded:

## Interagency Communication, Collaboration, and Interoperability

The MOU process should be strengthened to address gaps; that employees drafting MOUs have the proper tools and guidance they need; that reviewers follow a standardized process and document their review; and that the MOU Coordination Unit is involved in monitoring and oversight to ensure compliance with policies (RCMP 2019: 3).

An example of the uncertainties that surround MOUs is a memorandum directed to the Chair of the Halifax Regional Municipality Board of Police Commissioners from a solicitor with the municipality's Legal Services. The memorandum was a response to a request for "clarification around the enforceability of the Memorandum of Understanding signed by HRM, RCMP, and the Board in 2001" (Salsman 2020: 1). The Chair of the Board of Commissioners had raised the question after learning that the Department of Justice was not aware of the MOU. The Solicitor's position set out in the Memorandum was that since the Department of Justice was not a signatory, the MOU was only a statement of intention of the three parties and not an enforceable legal document.

#### **H. Decision-making in Dynamic Environments**

There is an emerging body of research literature on the thought processes of personnel involved in making decisions in dynamic settings (Hine & Bragias 2021: 1494). The Naturalist Decision Making (NDM) framework facilitates the study of decision-making in real-world environments, which are often more complex than lab-based scenarios and simulations (Klein, et al., 1993). The NDM model posits several key differences between traditional crises on the one hand and dynamic events that unfold rapidly on the other hand: the latter are complex, unpredictable, often have time pressures and involve multitudes of persons and multiple agencies. These characteristics place these events outside normal police practice.

Research has found that police officers may make decisions differently in situations involving significant time pressures (Orasanu & Connolly 1993). Specifically,

## Interagency Communication, Collaboration, and Interoperability

during high-pressure situations, people tend to make intuitive decisions based on previous experience, rather than following a slower analytical process... It has been suggested that because officers rely on the unconscious intuitive decision-making processes, they may be unable to effectively communicate their decisions with others (Hine & Bragias 2021: 1494; see also Cohen-Hatton & Honey 2015).

In addition to time pressure, major crises often require police officers and emergency responders to communicate and collaborate with personnel from other services, including fire and rescue and emergency medical services, with whom they may never previously have worked: “This interaction entails officers working with different personalities, cultures, goals, expertise, and jargon, which all add to the complexity of the situation” (Hine & Bragias 2021: 1495; see also Haferkamp et al 2011). The focus on interoperability frameworks, policies, and plans may obscure the human element of communications:

When we talk about communication failures, we may be thinking mode failures, but we may be discussing human failures... Unless we agree on a definition for communications, then we can't agree or analyze how communications failed... Most failures are human failures, and no matter how much money you spend on radios, you will still have communication failures when someone forgets to turn on their radio (Cox 2017b: 2–3; see also Cox 2017a).

### III. Barriers to Interoperability

Research has identified several barriers to interoperability in emergency situations. These include 1) organizational problems (e.g., poorly defined command structure); 2) poor information management; 3) inefficient communications; 4) inadequate situational awareness; 5) insufficient equipment; and 6) limited inter-agency training (Power & Alison 2017: 243).

Simulation exercises may have limited utility in preparing for an actual critical event, researchers noting, “Even when simulations are incredibly immersive, responders are aware that the exercise is fictitious and so the personal impact of such events, especially with regard to the salience of potential aversive long-term consequences (e.g. job loss), will be reduced” (Power & Alison 2017: 244).

## Interagency Communication, Collaboration, and Interoperability

**A. Centralized versus Decentralized Command Systems**

Discussions of interoperability often centre on the centralization and integration of first responder agencies (e.g., Boin 2004; Quantrelli 1988). Some observers, however, have argued against the concept of interoperability as entailing common operational pictures, a clear hierarchical organizational structure, collective accountability, and trust and effective communication (Kapucu & Garayev 2011). For example, House, Power, and Alison have contended that this framework is “unrealistic in practice due to the inherent stressors of the major incident environment” (2014: 331). Specifically, there are concerns that centralized, hierarchical incident management structures may hinder rapid multi-agency decision-making and response in dynamic environments (House, Power, & Alison 2014). Kapucu, for example, has found that “Hierarchies generally perform badly in emergencies, because if any of the hierarchy’s top nodes fail, they isolate large networks from each other” (2006: 208; see also Liu, Guo, & Nault 2017). Likewise, Power and Alison have argued that a centralized command system “adds complexity to the emergency because it can blur professional boundaries and increase confusion about roles and responsibilities within the networked team” (Power & Alison 2017: 243; see also Brown, Crawford, & Darongkamas 2000; Curnin et al 2015).

To combat this potential problem, some scholars advocate for a non-hierarchical, decentralized yet interoperable major incident management network: “[T]he concept of interoperability needs to embrace the decentralised nature of major incident command systems, rather than enforcing a desire for an unrealistic and unobtainable goal of centralised interoperability” (House, Power, & Alison 2014: 331). In this vein, Alexander has found that decentralized approaches provide more opportunity for local efforts that may be hampered or overridden by a centralized approach (Alexander 2010). Hine and Bragias have similarly noted:

## Interagency Communication, Collaboration, and Interoperability

During high-pressure situations, time-sensitive crises create conditions of increased decision-making for personnel at the lower levels of organizational structure, and less time for consultation amongst the team. This resulting autonomy amongst lower-level members created a “horizontal” style of functioning in teams, questioning the practicality of normative communication systems that tend to follow a rigid hierarchy (2021: 1502).

Moreover, researchers have highlighted the important role that middle managers, who are responsible for supervising personnel involved in service delivery:

Middle managers as effective leaders are critical to the success of any interoperability or collaboration program, because of their ability to liaise between upper management and the operational member... Effective middle managers have the unique ability to communicate internally and externally; essentially to play both sides of the field. As a result, they should be the driving force of interoperability and any management or executive attempt to re-align significant strategic goals must always include them in the process. (Coakeley 2016b: 2)

In first responder agencies, middle managers occupy the realm between frontline workers and senior management. In police agencies, for example, it is often non-commissioned officers (NCOs) who fulfill this function. There is additional research to be conducted on the centralized vs decentralized crisis management approaches and the role that middle managers play in both models.

### **B. Changing Policy versus Changing Behaviour**

Trust, reciprocity, and relationships, which may be as important as technological aspects of a plan. As Whelan (2016: 316) has stated, “A change in policy ... is not enough, as promoting the sharing of information requires a ‘need-to-share’ information culture. Policy, then, can clearly both support and undermine inter-agency collaboration.” There may be slippage between how a network is designed and how it is used/implemented by the involved agencies.

### **C. Organizational Factors: The Bureaucratization of Interoperability**

It has been noted, “Response organisations must be reactive and agile, achieving self-synchronisation between and amongst ... organisations. Major incident response requires a mix

## Interagency Communication, Collaboration, and Interoperability

of skills and capabilities dependent upon a network configuration rather than a singular organisation” (House, Power, & Alison 2014: 329). Researchers who have studied live disaster training exercises have found that participants frequently either revert to gathering information rather than progressing to action, or they take action without deliberately considering options (Waring, Moran, & Page 2020).

It has been stated that, “The best time to talk about how to respond to an incident is before they happen” (Calderwood 2017). In post-event analyses and inquiries, “Simply saying ‘communication failure’ says nothing about what failed, when it failed, where it failed, or how it failed. It is the exact equivalent of simply stating ‘something went wrong’” (Morgan 2022: 2). Rather, it is important to examine the context in which decisions were made: “Without the context, planners will not know what needs to be addressed or fixed.” (Morgan 2022: 2).

The lack of experience among agency decision-makers may also hinder an effective response. Major crises are quite rare, and police leaders and frontline officers may have little or no prior experience responding to such events (Rojeck & Smith 2007; Hine & Bragias 2021: 1493): “Major incidents are inherently ambiguous and complex; it is the associated experience of uncertainty that makes decision making difficult” (Power & Alison 2017: 244). In these circumstances, the police and other first responders are often required to go beyond their normal duties, training, and expertise.

Police services and fire/rescue services have traditionally had rigid command-and-control structures, but strict hierarchies and boundaries within and between organizations may inhibit effective decision-making (Eyre et al 2008), especially during critical incident responses. For example, the Incident Command System (ICS), which is used by many fire service agencies in Canada (see Dubowski, 2011), does not emphasize collaboration with other agencies and

## Interagency Communication, Collaboration, and Interoperability

services (Hanifen 2017). On the other hand, if there is effective multi-agency interdependence – that is, if participating agencies rely on one another “for their efforts, information and resources” – then the execution of the plans for responding to critical events is enhanced (House, Power, & Alison 2014: 324).

#### **D. Endogenous and Exogenous Stressors in the Major Incident Environment**

It is inevitable that decision-making when operating in an interoperable environment will be bounded. Major incidents are peppered with both endogenous and exogenous stressors causing uncertainty, derived from poor or miscommunication of complex situational factors along unstable and large hierarchical team networks (House, Power, & Alison 2014: 326, 331).

Research studies have found that endogenous and exogenous stressors often hinder interoperability and therefore hinder the timely and effective response to major incidents (Comfort 2007; House, Power, & Alison 2014). Endogenous challenges include lack of information, resource issues, e.g. personnel and equipment, time issues, and issues related to managing personnel (Power & Alison 2017: 247). In major crises, endogenous stressors include “complexity, time urgency, ambiguity and high risk.”

Whether a critical event unfolds over a relatively long period of time or is a dynamic, rapidly developing incident (such as occurred in Nova Scotia in 2020), there are stressors that challenge even the best interoperability mode. It has been noted that, “In practice, the stressors of the major incident environment distract commanders from coordinated multi-team functioning, reducing the tendency to make collaborative decisions and implement actions” (House, Power, & Alison 2014: 322).

The current literature on interoperability defines an interoperable response as being characterized by “a shared inter-agency understanding of the situation” (House, Power, & Alison 2014: 323). This involves the development of a “common operating picture”, which may be

## Interagency Communication, Collaboration, and Interoperability

more challenging to achieve in a rapidly unfolding critical event (House, Power, & Alison 2014: 323). The absence of a common operating picture can adversely affect a coordinated response to a critical incident, leading to a tendency of the participating agencies to “revert back to intra-agency hierarchies as a means of maintaining control” (House, Power, & Alison 2014: 323; Contestabile 2011).

**F. The Absence of Best Practices**

Researchers have noted, “The literature on multi-agency disaster response and collaboration is rich in in-depth case studies, but there is little cross-over learning and only rarely a more general evaluation of best practices” (Laufs & Waseem 2020: 11). The absence of best practices is due in part to the challenges in measuring the performance and effectiveness of security networks (Whelan 2016: 313). What is considered “effective” will vary among the individual agencies involved in the network, as well as among networks in different regions and those serving different populations (Provan, Fish, & Sydow 2007: 505).

The development of best practices is facilitated by conducting after-incident reviews that identify how a critical incident was responded to. However, only in exceptional circumstances are independent inquiries called to examine every facet of a response. Rather, reviews are usually called only after a major crisis in which there were serious operational failures. There is not a substantive body of literature on incidents in which the strategies used were successful. This focus on “bad” practices may not produce “best” practices. Moreover, it is generally left to individual agencies to conduct reviews, the results of which may not be published. Police, fire and rescue and emergency medical services need to have the capacity for conducting after-incident reviews and to compile the findings into lessons learned and best practice policies. It is important that planning processes identify vulnerabilities that may impact the ability of blue-light

## Interagency Communication, Collaboration, and Interoperability

agencies to respond to critical incidents (McLellan & Johnson 2018: 2). It is also important that the findings of reviews and the lessons learned be shared with the general public. This transparency will increase public trust and confidence in first responder agencies. An excellent example of an organizational “autopsy” is the report produced by then-Deputy Chief Constable Doug LePard, who examined all facets of the Vancouver Police Department’s investigative response in the case of Robert Pickton (LePard 2010). The 400+ page report is perhaps the most thorough and thoughtful study of an organization’s response to a crisis.

#### H. Agencies Operating in Silos

The current and past policies of municipal, provincial, and federal governments, combined with the independent practices and procurement processes of public safety and security organizations have created a collection of siloed communications networks incapable of efficient interoperability (General Dynamics Canada 2013: 8).

A challenge to developing security networks based on interoperability is that many organizations are hampered by their continued operation in silos and their misunderstanding of one another’s standard operating procedures (SOPs) (Coakeley 2016b; Seoane 2019a; Seoane, 2019b). Noting that multi-agency SOPs can work at cross-purposes, Coakeley has stated:

We can no longer afford to believe that our individual mandates supersede those of the other agencies with whom we are responding... The time wasted as a result of ignorance or misunderstanding of one another’s SOPs can have catastrophic effects... (2016a: 1 and 3).

In examining how agencies perform in crises, Laufs and Waseem (2020: 12) have found that most personnel make decisions and tailor their responses based on their specific field of expertise, and there are institutional boundaries that limit collaboration with other agencies. This in turn limits the effectiveness of responses. To ensure interoperability, participating agencies must understand and accept the hierarchy and the capacities and resources that each partner brings to the effort: “Collaborative multi-agency environments depend to a large extent on the

## Interagency Communication, Collaboration, and Interoperability

willingness of agencies to share information and coordinate their response with others”

(Olejarski & Garrett 2010; Laufs & Waseem 2020: 12). However, such sharing of information and coordination cannot be only ad hoc:

Success of collaborations amongst blue light organisations ... is not simply about why and under what institutional conditions they are formed; rather, it is about how each of these collaborations is managed over time in terms of the processes developed to build, nurture and support those networks (Wankhade & Parnaik 2019: 135).

The role of boundary spanners is thus not just to be an inter-agency link during major crises but to break down institutional boundaries on an ongoing basis. Frequent joint exercises are another strategy for interoperability, which can help to build trust between agencies (Laufs & Waseem 2020: 12). The RCMP transfer policy wherein senior leadership, non-commissioned officers and frontline officers are moved on a regular basis may prevent the development and sustainability of relationships of trust between the RCMP and municipal police services (LePard, 2010).

#### **IV. Elements of an Effective Multi-agency Response**

Research on interoperability has produced materials that can be used to inform the development of a framework for effective multi-agency response to major crises. Auf der Heide, for example, has identified the conditions that must be achieved for an effective multi-agency response in a crisis as the following (see also House, Power, & Alison 2014: 330):

- Articulation of commonly understood meanings or understanding of the threat between a system and its members;
- Sufficient trust among leaders, organizations, and citizens to overcome uncertainty and enable members to accept directions;
- Sufficient resonance or support of the community between the emerging system and its environment to gain support for action;
- Sufficient resources to sustain collective action under varying conditions; and
- Integration of the activities of responding agencies with their respective roles, incorporated in a planned and systematic manner.

## Interagency Communication, Collaboration, and Interoperability

Importantly, these conditions, which facilitate interoperability and collaboration between response agencies, raise several questions that should be considered when a jurisdiction is planning for interoperability in the context of crisis response:

- How can collaboration and interoperability best be established and sustained?
  - What elements facilitate interoperability and what are the barriers to interoperability?
  - What is the role of technology, organizational culture and protocols, and personal relationships in interoperability?
  - Which indicators should be used to monitor collaboration activity in the future?
  - What evidence is there of wider sharing of the lessons and of them being learned?
- (Kane 2018: 79)

The next section examines initiatives taken in the United Kingdom to improve interoperability among blue-light agencies, and those examples may be especially instructive for thinking about actions that Canadian jurisdictions can take to improve the effectiveness and efficiency of multi-agency response. The countries share the same system of government and the origins, and evolution of policing in Canada was heavily influenced by UK developments, e.g., Peel's principles of policing (Griffiths 2020).

## V. Interoperability in the United Kingdom: Experiences, Initiatives, Outcomes

Collaboration is a highly skilled change-management process. Building and maintaining collaborations call for the building of relationships, financial management, negotiation skills, creativity and the ability to learn. In too many places, the skills of the people leading and managing collaborations are not enough to meet the problems they face (HM Inspectorate of Constabulary and Fire & Rescue 2020: 19).

As part of an effort “supporting collaborative and innovative blue light working” (HM Government 2016: 4), the UK government has conducted major community consultations about collaboration among emergency services (HM Government 2016; HM Inspectorate 2020). The premise of these consultations was that “Closer working can enable the emergency services to deliver more effective and efficient services for the public” (HM Government 2016: 6). Two strategic planning documents, “Police Vision 2025” and the “National Digital, Data and

## Interagency Communication, Collaboration, and Interoperability

Technology Strategy (2020–2030),” provide a framework for increasing interoperability among police services. “Police Vision 2025” was designed to “shape decisions around transformation and how we use our resources to help keep people safe and provide an effective, accessible value for money service that can be trusted” (Association of Police and Crime Commissioners (APCC) & National Police Chiefs’ Council (NPCC) 2016: 2). The document states that local police services will be aligned, and among the strategies used to sustain this alignment is “improving data-sharing and integration to establish joint technological solutions and enabling the transfer of learning between agencies and forces so we can work more effectively together to embed evidence-based practice...” (APCC & NPCC 2016: 7).

The National Digital, Data and Technology Strategy, which was launched at the Police Digital Summit 2020, “sets out a new digital ambition for our service through a set of tangible digital priorities for policing and it outlines the key data and technology building blocks required to deliver them” (APCC 2020: 2). The strategy document sets out a pathway for developing and integrating technology and data systems, noting that “The improvement must be focused on capability rather than structure; in how we distribute digital transformation capabilities across policing to serve the needs of the whole network, and of localities.”

In addition to these most recent initiatives, Stephenson (2015) conducted a review of 37 public inquiry reports in the UK produced from 1986 to 2010 that investigated failures of interoperability. Among those studied were inquiries into the Derrick Bird shootings in 2010 (BBC 2011; Chesterman 2011); the 2005 London bombings (London Assembly 2006), the 1988 Lockerbie Bombing (Wells, 2009; Marquise, 2008); and other critical events, including floods, explosions, air and rail crashes, and disease outbreaks. Stephenson concluded that the most common failures identified were 1) poor working practices and organizational training; 2)

## Interagency Communication, Collaboration, and Interoperability

inadequate training; 3) ineffective communication; 4) lack of leadership; and 5) failure to learn lessons (2015, 109). In the case of the Derrick Bird shootings in Cumbria, there had been a lack of awareness and communication between different emergency services (Wainwright 2011). During the 2005 terrorist attacks in London, there had been “problems in communication, a lack of awareness of the roles of other members of the emergency services, and indeed outright hostility” (Charman 2014: 102; see also HM Government 2012).

This review prompted the UK government in 2012 to create the Joint Emergency Services Interoperability Programme (JESIP) in order “to achieve better cooperation and coordination between the three emergency services at the scene of a major incident” and to facilitate better working relationships between the services on an ongoing basis (Stephenson 2015: 109; see also Flanagan 2014; Pollock 2017).<sup>1</sup> A Joint Decision Model (JDM) (see **Figure 2**) was subsequently developed to be used by commanders in the police, fire and rescue, and emergency medical services to improve collaboration and effective decision-making. The JDM is designed to address the challenges in inter-agency communication, collaboration, and interoperability discussed earlier in this report. It provides a template that can be used in any jurisdiction to develop a framework to improve the effectiveness and efficiency of the response to major crises.

Interagency Communication, Collaboration, and Interoperability

Figure 2: The JESIP (UK) Joint Decision Model (JDM)

Source: JESIP. (no date). <https://www.jesip.org.uk/joint-decision-model> (accessed 5 April 2022)

The JDM is centered on three primary considerations, set out in **Table 1**.

Table 1: The Joint Decision Model (JDM)

Situation	Direction	Action
What is happening?	What do you want/need to achieve in the first hour (desired outcomes)?	What do you need to do to resolve the situation and achieve your desired outcomes?
What are the impacts?	What are the main aims and objectives of the emergency response?	
What might happen and what is being done about it?	What overarching values and priorities will inform and guide this?	
What are the risks?	What overarching values and priorities will inform and guide this?	
What might happen and what is being done about it?		

Source : <https://www.jesip.org.uk/joint-decision-model>

A related UK initiative was the development of a “single message to be used by each service for the declaration of a major incident and communicating relevant information to the

## Interagency Communication, Collaboration, and Interoperability

service-specific control room that would then be understood when shared with other services”

(Stephenson 2015: 114), known as “M/ETHANE.”<sup>2</sup> The M/ETHANE acronym stands for:

**M** major incident declared?  
**E** exact location  
**T** type of incident  
**H** hazards present or suspected  
**A** access (routes that are safe to use)  
**N** number, type, severity of casualties  
**E** emergency services present and those required

Source: JESIP webpage “M/ETHANE,” <https://www.jesip.org.uk/methane>

JESIP has produced a corresponding M/ETHANE checklist for those working in control rooms in order to help them collect the relevant information. Research cited by Stephenson (2015) has shown that the JDM and the M/ETHANE message have been effective in producing changes in blue-light agency practices and thereby enhance interoperability (116). For a more in-depth description of M/ETHANE and its use, see the JESIP Resource Manual (2018: 13–14, 88–89, 130–32).

As part of efforts in recent years to prioritize interoperability, over 10,000 operational and tactical commanders in the United Kingdom have been trained in “the new way of working, and this is being achieved by each commander attending a day’s training, which is delivered by a multiagency team from each of the blue light communities” (Stephenson 2015: 113). According to Stephenson, this training “has not only significantly increased the understanding of the issues and pressures being experienced by the different services but also forged some of the relationships that over time had started to diminish due to different organizational pressures that had removed the capacity for commanders to participate in exercises” (113). However, there has so far been no published evaluation of the impact of this training and relationship-building on the

## Interagency Communication, Collaboration, and Interoperability

response to major crises. However, case studies of collaboration within emergency services projects in the United Kingdom have identified several lessons that can inform Canadian discussions of interoperability. Some of these are listed here (adapted from Kane 2018: 85):

- Where emergency services collaboration is successful, it is grounded in a clear, shared vision between partners.
- Local political (non-partisan) endorsement is critical in providing support.
- It is often key individuals who drive collaboration, and this requires that appropriate communications and transfer of responsibilities are in place when those personnel move on.
- Appropriate, universally agreed governance structures are essential in the management and development of collaboration.
- In collaboration between services (inter), it is important that due consideration is given to collaboration within the same service (intra).
- In aligning services through collaboration, retaining “brand” identity is both a common aspiration and a key challenge.
- There is positive public backing for collaboration but a lack of public awareness about what currently happens.
- Sustainability of collaboration is linked to local decisions around future direction (e.g., underpinning what exists or expanding reach).
- Collaboration would be given further momentum if linked to key performance indicators. These could cover things such as response times, public confidence, capital expenditure, crime and detections rates, cost savings, etc.
- Future funding is key to sustainability and expansion – a range of options exist, for example, more funding from governments.
- Data is patchy, inconsistent, and not linked to targets.
- The limited evidence of successful financial outcomes hinders conclusive economic analysis.

The government of the United Kingdom has itself also recently explored the performance of police-to-police collaborative arrangements in all 43 England and Wales police forces and six case studies of collaborative initiatives to determine the factors that affect their success or failure (HM Inspectorate 2020). The findings reveal that good practice in police collaboration has several requirements:

## Interagency Communication, Collaboration, and Interoperability

1. Collaboration must demonstrate a benefit to the public by having clear objectives, a clear identity, and the purpose of the collaboration must be clearly set out to the public (HM Inspectorate 2020: 5).
2. The costs–benefits of collaboration are important, which not only includes fiscal costs but also the benefits of having the capacity to effectively respond to critical incidents and events (HM Inspectorate 2020: 6).
3. Trust is a key element of leadership and governance for collaborative relationships, including delineating “how decisions will be made and who will make sure that tasks are allocated and completed” (HM Inspectorate 2020: 6).
4. It is important to recognize the “complex and specialist nature of collaboration. It is a highly skilled change-management process that needs good relationship-building, financial management, political skills and creativity” (HM Inspectorate 2020: 7).
5. “Putting the right people with the right skills in place leads to success and improves the efficiency and effectiveness of the programme” (HM Inspectorate 2020: 7).
6. Too often, decision-making is complex and bureaucratic, due in part to police services not adapting their structure “to fully achieve the benefits of the collaboration” (HM Inspectorate 2020: 17).
7. It is necessary to conduct evaluations of collaborative initiatives to identify the factors that facilitate and hinder positive outcomes and to determine how collaboration can be enhanced (HM Inspectorate 2020: 20).

## VI. Major Crises in Canada: Findings and Recommendations

Reports and inquiries that are produced after major crises can provide important insights into the factors that facilitate or hinder interoperability. A review of the government of Alberta’s response to the historic floods in the southern part of the province in 2013 found that this disaster “tested Alberta’s emergency management system to a degree never before encountered and rarely seen globally” (MNP 2015: 1). The review found that there were “extensive emergency management skills, capability and capacity throughout the Government of Alberta and the province,” and there was a framework for emergency management in place that involved a variety of stakeholders, including NGOs, the federal government, and industry (MNP 2015: 6). However, the report noted, “In order to successfully implement and execute the framework,

## Interagency Communication, Collaboration, and Interoperability

structures and plans the required emergency management must be in place” (MNP 2015: 6).

While the response to and recovery from the floods were aligned with best practices, the review nonetheless found that there were gaps and opportunities for improvement:

The lack of a formalised and comprehensive emergency social services framework was one of the most significant gaps in overall response and recovery. [...] The absence of a provincial framework resulted in coordination and communication issues, lack of clarity regarding roles and responsibilities and challenges with delivery. Although challenges were eventually overcome through the outstanding efforts of the individuals and groups involved, there is an urgent requirement to develop and implement a provincial emergency social services framework (MNP 2015: 9).

Where frameworks, plans and procedures were in place, and people were trained in their use, communication and information passage was quite effective. In situations where these underpinning elements were not in place there were communication challenges. Therefore, the path to improved communication is to provide the appropriate frameworks, plans and procedures, and then ensure that all involved are aware of them and practiced in their use. (MNP 2015: 62).

#### **A. Systemic Failures of Interoperability Within and Between Police Services**

Virtually every interjurisdictional serial killer case including Sutcliffe (the Yorkshire Ripper), and Black (the cross-border child killer) in England, Ted Bundy and the Green River Killer in the United States and Clifford Olsen in Canada, demonstrate the same problems and raise the same questions. And always the answer turns out to be the same—systemic failure. Always the problems turn out to be the same, the mistakes the same, and the systemic failures the same (Campbell 1996 (“Bernardo Review”): 4).

Cases involving serious criminal behaviour can unfold rapidly or occur over a lengthy period. In either situation, the interoperability within and between police organizations plays a significant role in the ability of the police and other emergency services to respond effectively. The mass casualty event in Nova Scotia was a dynamic, rapidly unfolding event, unlike the cases of Paul Bernardo, Robert Pickton, and others where the criminal acts were perpetuated over a longer period of time. While there are unique features of rapidly evolving critical events, the issues of interoperability are similar.

In 2014, three members of the RCMP Codiac detachment in Moncton, New Brunswick were killed and two others wounded in confrontations with a 24-year-old who was armed with a

## Interagency Communication, Collaboration, and Interoperability

high-powered rifle. The subsequent findings of an inquiry into the incident provide insights into the nature of police responses to rapidly unfolding events in which suspects are armed. The review of the Moncton event found that “On June 4, 2014, supervisors in Codiac were confronted with a situation that in many ways exceeded what supervisors are trained to deal with. They were faced with a crisis situation that evolved quickly, was operationally challenging and highly emotional” (MacNeil 2014). The final report set out a number of recommendations in five areas: 1) supervision, 2) training, 3) technology, 4) equipment, and 5) communications and aftercare. Specifically, the recommendations included ensuring that officers are equipped with cellphones and police radios while on duty and the development of a radio and data system to facilitate communication between RCMP members in all maritime divisions (MacNeil 2014). The RCMP (2015) issued a response to the report, accepting the recommendations and setting out a timeline for taking initiatives to address the areas of concern that were identified. In 2017, the RCMP issued an update on actions taken on the recommendations of the MacNeil report (RCMP 2017). These included providing additional training to frontline supervisors to manage critical incidents, improving effective communication among officers and to the public when responding to critical incidents, and improving equipment and technology. There have been no published updates since 2017 and no independent evaluation of the initiatives and their effectiveness in improving the response to critical incidents.

**B. Decision-Making and Interoperability in Major Case Investigations**

The investigation into the missing and murdered women in the Robert Pickton case stretched over many years, as did the crimes committed by Paul Bernardo. The inquiries that were conducted into these cases following the arrests of Pickton and Bernardo revealed key issues surrounding the interoperability of police services.

Interagency Communication, Collaboration, and Interoperability

Between May of 1987 and December of 1992, Paul Bernardo raped or sexually assaulted at least eighteen women in Scarborough, Peel, and St. Catharines, Ontario and killed three women in St. Catharines and Burlington. Following Bernardo's arrest in February 1993, a review was conducted of the investigative activities of municipal police services, the Ontario Provincial Police, and forensic agencies (Campbell 1996). One of the major findings of the review was that:

There were times during the separate investigations [...] that the different police forces might as well have been operating in different countries... Because of systemic weaknesses and the inability of different law enforcement agencies to pool their information and co-operate effectively, Bernardo fell through the cracks... (Campbell 1996: 5).

In commenting on the future ability of Ontario law enforcement agencies to effectively respond to similar circumstances, Justice Campbell stated:

Ontario has, in its existing law enforcement agencies, the essential capacity to respond effectively to another case like this, but only if certain components of those agencies are strengthened and only if systems are in place to co-ordinate and manage the work of different agencies (Campbell 1996: 5).

The extent to which the Bernardo Review resulted in lessons learned for Canadian law enforcement agencies was called into question by the investigation and eventual arrest in 2002 of Robert Pickton, who would be convicted of murdering sixteen women in British Columbia between the late 1980s and the early 2000s. Following his conviction in 2007 for the second-degree murder of six women (while facing additional first-degree murder charges in the death of twenty other women), two major inquiries were convened to consider why Pickton had been able to commit so many homicides over a span of three decades (LePard 2010; Oppal 2012). The interoperability, or lack thereof, between the Vancouver Police Department (VPD) and the RCMP during these years was a focus of both inquiries.

## Interagency Communication, Collaboration, and Interoperability

In 2010, the VPD tasked then-Deputy Chief Constable Doug LePard with conducting an in-depth management review of how the department's investigation into missing women had been conducted. The findings from this review included:

1. The VPD should have recognized earlier that there was a serial killer at work and responded appropriately, but the investigation was plagued by *a failure at the VPD's management level to recognize what it was faced with* (emphasis added).
2. When the VPD did respond with an investigative unit targeted at investigating the Missing Women as potential serial murders, the investigative team suffered from a lack of resources, poor continuity of staffing, *multi-jurisdictional challenges*, a lack of training, and a lack of leadership, among other challenges (emphasis added).
3. There was compelling information received and developed by the VPD and the RCMP from August 1998 to late 1999... suggesting that Pickton was the likely killer, and it was sufficient to justify a sustained and intensive investigation. The VPD received the first information about Pickton in July and August 1998, and also received extraordinary information from an unrelated informant in 1999... The information suggested that Downtown Eastside sex trade workers were willingly visiting the Pickton property in Coquitlam and some were being murdered there
4. The VPD passed on ALL information about Pickton to the RCMP when it received it, because the RCMP had jurisdiction over the investigation of information pertaining to crimes occurring in Coquitlam.
5. The RCMP accepted responsibility for investigating the Pickton information and led an investigation in Coquitlam. This investigation was intensely pursued until mid-1999 but was thereafter essentially abandoned by the RCMP, although the RCMP continued to explicitly assert authority over the investigation. *RCMP management appears to have not understood the significance of the evidence they had in 1999 pointing to Pickton, ... and did not ensure it was collated in such a way as to allow a proper analysis* (emphasis added).
6. Notwithstanding the many deficiencies in the VPD investigation, they did not cause the failure of the investigation into Pickton because *the RCMP had responsibility for that investigation while the VPD focused on other investigative avenues*. If the VPD investigation had been better managed, however, the VPD could have brought more pressure to bear on the RCMP to pursue the Pickton investigation more vigorously (emphasis added).
7. There have been significant improvements in the VPD due to the lessons learned from the Missing Women investigation, including better training, analysis, resources, and leadership. *There have also been significant improvements in the response to multi-jurisdictional crimes by the VPD, the RCMP, and other police agencies in BC, but other improvements are needed* (emphasis added).
8. Had there been a regional police force in the Lower Mainland at the time of the Pickton investigation, the problems created by the multiple policing jurisdictions would have been significantly reduced and a better outcome likely would have resulted—*there would have only been one set of organizational priorities* (LePard 2010: 18–19, emphasis added).

Interagency Communication, Collaboration, and Interoperability

Several of these findings relate directly to the significant challenges of interoperability that existed between the VPD and the RCMP and that hindered the investigation into the missing women and delayed the identification and arrest of the perpetrator. Key themes in the findings included a lack of communication within the VPD and between the VPD and the RCMP, leadership and management issues, and the fracturing of the case investigation process due to the absence of a regional police service.

In addition to the VPD review of the Pickton case, the provincial government appointed Justice Wally T. Oppal as commissioner of an inquiry into the response of police agencies to missing women, many of whom were the victims of Robert Pickton. The inquiry heard from a variety of stakeholders, including the victim's families, police services, and officers involved in the investigations. From the evidence gathered during the inquiry, Justice Oppal posited several possible explanations for the failures of the police services investigating the missing women in the Greater Vancouver region: 1) discrimination in the form of systemic institutional bias and political/public indifference; 2) a lack of leadership in the supervision and management of the investigations; 3) limited and outdated policing systems, approaches, and standards; 4) the fragmentation of police services in the Lower Mainland of British Columbia; 5) inadequate resources; 6) police culture and people problems; and 7) an alleged conspiracy (Oppal 2012: 93).

Justice Oppal concluded that, although there was no evidence of overt individual bias that contributed to the failings of the police investigations, there was systemic bias in the policing response to the missing women (96):

Policing systems failed because unintentional, but unchecked, systemic bias led to faulty risk assessments, an inadequate emphasis on proactive prevention strategies, an inadequate allocation of resources, and significant oversights in pursuing investigative strategies (Oppal 2012: 109).

## Interagency Communication, Collaboration, and Interoperability

There was also an absence of leadership: “No senior manager at the VPD, RCMP ‘E’ Division Major Crime Section, Coquitlam RCMP, or Provincial Unsolved Homicide Unit (PUHU) took on this leadership role and asserted ongoing responsibility for the case” (Oppal 2012: 96). This resulted in “investigations without sufficient direction, staffing or resources... [T]he pattern of disengaged leadership was due to a combination of lack of interest and understanding” (Oppal 2012: 97). The police investigations were also hindered by a “parochial and silo-based approach to policing” and the “poor or non-existent integration of community-based principles” into the investigative process (Oppal 2012: 98 and 99).

The Inquiry also found serious communication issues amongst the municipal and RCMP police services in the Lower Mainland, due to the fragmented policing arrangements and the absence of a regional police service: “The failure to take all necessary measures required by cross-jurisdictional crime resulted in serious communication failures, linkage blindness, uncoordinated parallel investigations, and lack of sharing of key evidence” (Oppal 2012: 100). These are all attributes of a lack of interoperability, as discussed above.

The Inquiry also revealed that police culture and “people problems” hindered the investigations (Oppal 2012: 103). Regarding the issue of police culture, the Report states, “Organizational culture influences all aspects of an institutional life, particularly decision-making, and *shapes the interactions of members and between members and outsiders*” (Oppal 2012: 103, emphasis added). In elaborating on “people problems,” which the Report describes as “interpersonal issues, lack of fit of an officer for a position, and other personnel level issues,” the Report states, “Several personality conflicts and personnel issues affected the dynamics of the investigation” (Oppal 2012: 104). The findings of the Oppal Inquiry thus laid bare many of the issues surrounding the interoperability of police services that have been documented in other

## Interagency Communication, Collaboration, and Interoperability

jurisdictions and in research findings. Words of warning were thus offered by Mr. Justice Oppal: “I conclude that serial killers will continue to win the day as long as we continue to ignore past lessons” (Oppal 2012: 93).

## **VII. Final Thoughts: Best Practices in Interoperability**

A review of the research on interoperability in crisis situations in Canada, the United Kingdom, and elsewhere reveals best practices that can inform the development of effective and efficient multi-agency responses to crises. These best practices include:

1. Strong, high-performing networks are based more on collaboration than cooperation (see section II-A above). The ideal is integration.
2. Technology, integrated data systems, and information-sharing are important but must have an integrative framework to be of maximum utility.
3. Informal interpersonal relationships based on trust are as important as formal inter-agency relationships.
4. The cultures of participating agencies may dampen interoperability. Jurisdictions should therefore promote a positive network culture that will mitigate the barriers imposed by individual agency cultures.
5. Jurisdictions should reduce cultural fragmentation between individual police services and between police services and other first responders.
6. Joint training sessions, the development of formal and informal relationships based on trust, reciprocity, and aligned mutual interests should be features of strategies designed to improve interoperability.
7. Addressing current gaps in interoperability should include strategies for building relationships among key decision-makers.
8. Planning in advance of crises increases the effectiveness of agency and multi-agency responses.
9. Emergency preparation training should be provided to officers at all ranks, not just to senior leadership. There should also be regular training with other emergency response agencies.
10. To accommodate multiple agencies with their own cultures and operating procedures, efforts should be made to delineate clearly defined roles for agencies and individual units and have a command structure that is “as decentralised as necessary and as centralized as possible” (Steinberger 2016; Hine & Bragias 2021: 1504).

## Interagency Communication, Collaboration, and Interoperability

11. “There should be a continuous sharing of resource information between partners, collaborative decision-making about invoking schemes for inter-agency decision-making and an ongoing review of the needs of civilians” (Laufs & Waseem 2020: 12; see also Guddemi 2021).
12. There should be a development of protocols to ensure the sustainability and continuity of formal and informal relationships within and among blue light agencies.

The development and implementation of effective interoperability within and among blue light agencies depend upon training, expertise, planning and implementation, leadership, and personal relationships (Steigenberger 2016; Severson 2019). The goal is to create a “collaborative culture and to develop formal and informal institutional procedures that improve the ability of emergency response agencies to collaborate in a disaster” (Laufs & Waseem 2020: 12; see also Kristiansen, Haland, & Carlstrom 2019). Agreements and protocols should be established to ensuring the continuity and sustainability of these components. It is important that participating agencies speak a “common language,” which may require stepping outside individual agency cultures and traditional practices (Kristiansen, Haland, & Carlstrom 2019). Essential requirements include improving management control; formalizing organizational structure, responsibility, and authority; improving performance measurement and evaluation; and improving oversight of interoperability-related committees (New Hampshire Department of Safety 2019). It is also important to have strategies for achieving stakeholder support for organizational change (Kane 2018).

There is an emerging literature of best practices from the United Kingdom and from research literature more broadly that can guide the creation of structures and processes of interoperability and thereby facilitate true inter-agency collaboration between blue-light agencies, allowing for effective responses to major crises.

## **I. Introduction**

The purpose of this report is to provide the Commissioners of the Joint Federal/Provincial Commission into the April 2020 Nova Scotia Mass Casualty (henceforth referred to as the Mass Casualty Commission, or Commission) with an informed overview and discussion of two core concepts: (1) the definition of Mass Casualty Incidents (MCIs),<sup>1</sup> with a focus on a working definition of MCIs for the Canadian context; and (2) the background characteristics and antecedent attack behaviours of lone-actor public mass murderers (including ideologically motivated and non-ideologically motivated ones).

## **II. Conceptualizing MCIs: The Terminological and Definitional Literature**

### **MCI**

One of the earliest and perhaps most important lessons that any researcher learns is that social science, like any rigorous discipline, is predicated upon the common usage of language, concepts, and terminology. This allows us to properly classify and bring a measure of analytic order and control when confronted with confusing situations. However, as discussed at length below, one of the major pitfalls within the current literature on MCIs is the lack of terminological and definitional clarity. Without commonly accepted terminology, there is a distinct risk that any concerted effort to study and understand the phenomenon will become mired in frustrating and ambiguous debates over the prevalence and nature of MCIs. The first half of this report therefore provides a brief overview of the major issues under debate within the existing literature on MCIs before turning to a proposed Canadian-centric working definition of MCIs.

---

<sup>1</sup> For clarity, we have chosen to employ “Mass Casualty Incident” (MCI) as an umbrella-term in order to stay consistent with the terminology of the Mass Casualty Commission.

### **1. Identifying the Relevant Literature on MCIs**

The initial exploratory phases of this report involved a systematic keyword search of major academic databases to create a large sample of relevant literature.<sup>2</sup> The search generated a total of 10,417 related sources dating from 1999 to 2021. This larger list was narrowed down to include only sources with legitimate academic, governmental, or legal provenance and then narrowed down further based on an informed assessment of the abstract or executive summary of each document. The final criteria for including sources in the overall analysis were fairly broad, and those that directly attempted to define or discuss the definition of MCIs or involved some form of analysis of one or more events involving mass casualties were included. Additionally, all the sources were exclusively in English. A total of 95 different academic and scholarly sources were ultimately retrieved from the database, including legal analyses, case studies, theoretical discussions, definitional discussions, and meta-analyses related to Canadian, American, Oceanic, and European MCIs.<sup>3</sup> These 95 sources inform the overview, observations, and recommendations provided in the first half of this report.

### **2. Key Observations from the Literature on MCIs**

This section provides a discussion of our major observations from the survey of the research literature on MCIs in order to ground the Commission's report in an adequate sense of the relevant core concepts involved in the study of MCIs, as well as to lay the conceptual groundwork for the proposed Canadian-centric definition of MCIs.

---

<sup>2</sup> A full list of the keywords used is available upon request.

<sup>3</sup> Appendix 'A' contains the full list of academic, legal, governmental, and other related sources used in this portion of the report.

#### A. Definitional Ambiguity

From the initial 95 sources, a total of 64 distinct terms were identified that are related, in some form or another, to defining or conceptualizing MCIs (see **Table 1**). Each of the 64 identified terms in **Table 1** informs and shapes the scholarly, legal, or government analyses that make use of that term. A thorough review of each of the 95 sources and their efforts to define MCIs suggests the presence of widespread ambiguity over the precise characteristics of MCIs. This ambiguity present within the literature is the result of differing opinions on five core areas of contention surrounding the *timing/location*, *deadliness*, *visibility*, *success*, and *method* of the violent incident. We break down each of these areas of contention in greater detail below:

- (1) **Timing and Location:** Delisi and Scherer (2006) provide a salient example of how the timing and location(s) of a particular MCI can affect how it is defined. They discuss the difference between three different terms based upon the duration and discreteness of the incident(s) that take place: a “serial killer” engages in prolonged violence over time, a “mass killer” engages in violence in a single time and place, while a “spree killer” engages in violence within a single specific time period but with multiple locations. Timing and location also play a role in several other prominent definitions. Gill et. al (2017: 711) and Duwe (2019: 21) define a “mass murder” as a violent incident that takes place at either one location or several geographically close locations over a short and discrete period of time. Other terms like “school shooting(s)” and “workplace shooting(s)” treat the location as the defining aspect of particular MCIs, taking precedence over other criteria or traits (Lankford 2012b: 258).
- (2) **Deadliness:** The most common threshold appears to be four or more victims (not including the perpetrator(s)) when defining how deadly an incident needs to be in order to be considered an MCI. The four-or-more threshold is drawn from the definition employed by the US Federal Bureau of Investigation (FBI) (see Marganski 2019: 14). In a recent meta-analysis of the empirical literature on mass shootings, Kim, Capellan and Adler (2021: 5) found that 56% of the research they examined used the threshold of “four or more” victims to classify an event as a mass shooting. Other sources that used an alternative threshold tended to employ the one set by the US Congress definition of “mass murder,” which involves three or more killings in a discrete, public location (see Marganski 2019: 14).
- (3) **Visibility:** Most definitions make either an overt or an assumed distinction between private and public violence but differ on whether or not private forms of violence should be treated as MCIs. There is a small subset of specialized literature that focuses on the nature of the violent act, such as family or gendered violence (e.g., familicide, family killing, family mass murder) and considers these acts of violence as a form of MCI (Duwe 2019: 19). Other sources argue that while perpetrator(s) motivations and the nature of their attack may be private, there must be some form of public aspect that defines the violent act, such as the type

of victims of the attack (i.e., members of the public with no prior affiliation to the perpetrator(s) or specifically targeted groups such as women or visible minorities), the method of the attack (i.e., use of firearms or bombs), the location of the attack (i.e., a public venue), and/or the scale of the attack (i.e., the number of victims).

- (4) **Success:** The literature differs in opinion on whether relevant acts of violence that were thwarted or planned but not executed, or that resulted in no deaths should be considered MCIs (Dowden 2005: 8–9). Kim, Capellan, and Adler (2021: 5) note that the literature is almost evenly split, with 51% of research including incidents where perpetrators intended but failed to kill people, while 49% of the literature purposefully excluded failed incidents from their analyses.
- (5) **Method:** The violent method employed by the MCI perpetrator(s) also plays a prominent role in many definitions, with the most notable trend among the 64 terms listed in **Table 1** focusing on firearms: 26 of the 64 (~41%) of the identified terms use either “shooting(s)” or “shooter(s)” as a primary or secondary criteria, with all 26 of these terms originating from sources or authors from the United States and focusing on American MCIs or the American socio-political context for MCIs. There were some exceptions to this trend, with several Australian sources employing the term “mass shooting” (Chapman et al 2016; Lemieux et al 2015) and “public shooting” (McPhedran 2020), and two Swiss sources employing the term “school shooting” (Frei & Ilic 2020) and “familicide” (Ilic & Frei 2019). Logically, the US preference for using the term “shooter(s)” and “shooting(s)” is driven by the endemic gun violence within the country (see NCHS 2021) and the prominent role that gun ownership plays within the larger American political discourse. The Australian usage of those terms within the literature reflects the high profile of gun control initiatives in the wake of their last largescale MCI in 1996, while compulsory military service in Switzerland provides a certain level of firearm access to their citizenry, which suffered their last high-profile MCI in 2001.

#### B. Lack of a Common Terminological Framework

Needless to say, the vast number of available terms outlined in **Table 1** is both analytically and practically unhelpful when trying to operationalize and understand the core aspects, traits, and trends of MCIs. Many of the available terms can be too narrow in their focus (e.g., by focusing exclusively on MCIs involving gun violence) (Fox & Levin 2021), differ from one another in terms of basic conceptual criteria (Gurian 2017), and are often not interchangeable (Bowers, Holmes, & Rhom 2010). Furthermore, as will be discussed below, the presence of many different terms across the literature can lead to definitional ambiguity, with researchers and organizations attaching differing meanings and importance to the available terms (e.g., treating “mass murder” as a broader phenomenon than “mass shooting”) (Krouse & Richardson 2015: 2). Without basic

agreement on common terminology, many researchers have differing starting points in terms of their analyses and inquiries. As a result, many of the current conclusions and observations about MCIs cannot extend beyond individual efforts to understand it as a social phenomenon, since the confused and disparate terminology fundamentally means they are examining “similar but different” social phenomena. This makes generalizing actionable and practical conclusions from the current literature impossible.

It is worth noting that the difference between the taxonomy proposed here and the five core areas of contention (*timing/location, deadliness, visibility, success, and method*) surrounding the definitions of MCIs presented in the preceding section is largely due to specificity issues. Namely, these areas of contention delve into concepts that cannot be adequately and consistently reflected by the 64 terms found within the existing literature on MCIs. For example, only *visibility* and *method* can be adequately assessed for the term “mass public shooting,” while only *timing/location* can be adequately assessed for the term “school shooting,” and so on. In order to focus on the most salient aspects of each term, the proposed taxonomy in this section categorizes each by more flexible primary and secondary criteria.

Table 1: Categorization and Sub-categorization of 64 Definitional Terms within MCI Literature (1999–2021)

		Secondary Criteria				Total
		Scale	Motivation	Criminality	Genre	
Primary Criteria	Scale		<ul style="list-style-type: none"> <li>○ Mass shooter terrorism</li> <li>○ Ideological mass shooter</li> <li>○ Mass political violence</li> </ul>	<ul style="list-style-type: none"> <li>○ Mass murder</li> <li>○ Mass homicide</li> <li>○ Mass murder-suicide</li> <li>○ Multiple murder</li> <li>○ Multiple homicide</li> <li>○ Serial murder</li> <li>○ Mass killing</li> <li>○ Mass targeted violence</li> <li>○ Completed mass killing</li> </ul>	<ul style="list-style-type: none"> <li>○ Mass violence</li> <li>○ Mass violent incident(s)</li> <li>○ Mass violent victimization</li> <li>○ Public mass violence</li> <li>○ Public mass shooting</li> <li>○ Multiple shooting/shooters</li> </ul>	18

	Motivation		<ul style="list-style-type: none"> <li>o Individual terrorism</li> <li>o Lone-actor terrorism</li> <li>o Lone-wolf/offender terrorism</li> <li>o Lone terrorist (and other types)</li> <li>o Ideologically motivated attack</li> <li>o Non-ideologically motivated attack</li> <li>o Demand-based terrorism</li> <li>o Revolutionary terrorism</li> <li>o Private justice terrorism</li> </ul>			9
	Criminality	<ul style="list-style-type: none"> <li>o Classic mass murder</li> <li>o Family mass murder</li> </ul>		<ul style="list-style-type: none"> <li>o Family killing</li> <li>o Familicide</li> <li>o Massacre</li> <li>o School massacre</li> <li>o Autogenic massacre</li> <li>o Felony-related massacre</li> <li>o Autogenic massacre</li> <li>o Spree massacre</li> <li>o Spree killing</li> </ul>		11

Total		12	20	19	13	

*\*Each term appears only once in this grid, and the terms "Mass Casualty Incident" and "Mass Casualty Event" were excluded since they are terms that were adopted for the purpose of this report.*

With this in mind, in an attempt to organize the diverse terminology and criteria used by the extant literature, the 64 identified terms were ordered into four primary criteria, and an additional four secondary criteria. This exercise in categorizing the available terminology within the literature on MCIs is useful for distilling what researchers and practitioners view as important

when trying to parse and understand this particular genre of violent event. The four primary criteria are as follows:

- (1) **Scale:** This criterion concerns the scope, extent, scale, and/or magnitude of the act of violence. Examples of terms that focus on this criterion include “mass murder,” “mass violence,” “public mass violence,” “school massacre,” “spree killing,” and so on. Eighteen of the examined terms use scale as a primary criterion, while twelve of the terms use it as secondary criterion.
- (2) **Motivation:** This criterion concerns the ideological and/or personal motivations held by the perpetrator(s) and tends to encompass acts that are defined by the authors or some other formal body as “terrorism.” Examples of terms that focus on this criterion include “ideologically-motivated attack,” “ideologically-motivated mass shooting,” “terrorist incident,” and so on. Nine of the examined terms use motivation as a primary criterion, while twenty of the terms use it as a secondary criterion.
- (3) **Criminality:** This criterion relies on legal definitions of murder and/or homicide that have multiple victims. Examples of terms that focus on this criterion include “multiple homicide,” “mass murder,” “family mass murder,” “classic mass murder,” and so on. Eleven of the examined terms use nature as a primary criterion, while nineteen use it as a secondary criterion.
- (4) **Genre:** This criterion looks at other notable factors that characterize the act or event such as its location, completion/foiled status, or the social/political context. Examples of terms that make use of this criterion include “school violence,” “active shooter,” “gendered violence,” and so on. Twenty-six of the examined terms use genre as a primary criterion, while thirteen use it as a secondary criterion.

These criteria are not meant to be mutually exclusive, and most available definitions span two or more categories. The 64 available definitions were sorted by criteria, and in cases where there were more than two obvious criteria, each definition was classified by the two most relevant categories associated with the definition. Out of the primary criteria, *genre* was the most prevalent, with 26 definitions, followed by *scale* with 18 definitions, *criminality* with 11 definitions, and *motivation* with 9 definitions. Out of the secondary criteria, *motivation* was the most prevalent, with 20 definitions, followed by *criminality* with 19 definitions, *genre* with 13 definitions, and *scale* with 12 definitions. A full list of the categorization of the 64 identified terms is available in Table 1. The table is meant to be read from left to right, with the row

category classified as the main theme, and the column as the secondary theme. The criteria listed here are meant to be used as heuristics, and elements of subjectivity are inevitable when attempting to classify each of the examined terms. Due to the variability of the available terms, some will inevitably resist proper categorization within a finite number of criteria. Therefore, Table 1 is meant to give the Commission a sense of the priorities and foci found within the existing definitional literature on MCIs, more than a rigid classification of the concept.

#### **C. Lack of Canadian Sources on MCIs**

Given the Canadian context of this report, particular attention was paid to definitional and terminological literature that was either produced by or focused on Canadian MCIs and/or Canadian contexts. A comprehensive and systematic search of multiple databases, indexing systems, and other similar sources yielded just five academic articles that had an exclusively Canadian focus: a national investigation of multiple murders (Cale et al 2010), a typology of Canadian terrorist acts (Leman-Langlois & Brodeur 2005), a discussion of the Canadian Criminal Code within the context of MCIs (Akhavan 2009), a Canadian homicide survey (Trussler 2010), and a discussion of Canadian multiple murder legislation of 2011 as it relates to life-long incarceration (Spencer 2017). Overall, Canadian-centric material on MCIs accounts for less than 5% of the overall literature and lacks any sort of breadth from which to synthesize generalizable findings about Canadian MCIs.

#### **3. A Proposed Working Definition of Canadian MCIs**

The lack of Canadian scholarship on MCIs, coupled with the existing terminological and definitional ambiguity, is problematic for any efforts aimed at operationalizing and understanding the core characteristics of MCIs within the Canadian context. In addition, there

are no Canadian analogues for the FBI and US Congressional definitions of MCIs to shape governmental inquiries or academic research. This presents an opportunity to create a working definition of Canadian MCIs that can be informed by the strengths and weaknesses of the existing definitions within the literature. The existing debates and controversies within the scholarly and practical literature on MCIs have highlighted points of contention and consensus, and therefore allows us to craft a Canadian definition informed by this intellectual discussion. Furthermore, a uniquely Canadian definition that reflects the national character, as well as the social and political realities, of MCIs on Canadian soil will help mitigate issues that may arise when transposing another definition crafted through the use of legal concepts, socio-political values, and case studies from other national contexts. We therefore present a proposed working definition of Canadian MCIs, taking into account the trends and debates identified in the relevant literature. We define a Canadian Mass Casualty Incident as:

A premeditated and successfully executed act of violence during which one or more perpetrator(s) influenced by personal grievances, beliefs, and/or outside ideological sources physically injure(s) and/or kill(s) four or more victims during a discrete period of time.

The wording in the first half of the proposed definition distinguishes MCIs from other more commonplace forms of interpersonal violence. The utility of a Canadian definition of MCIs hinges on criteria that will allow for previous as well as future acts of mass violence to be properly classified and understood as fundamentally different. This in turn will allow for concentrated efforts by both academics and governmental bodies such as the Commission to operationalize the proposed definition to isolate the causes and consequences of MCIs in order to craft empirically grounded analyses with the potential to inform policy and practice aimed at detecting and preventing future MCIs. Therefore, the inclusion of the “premeditated and successfully executed” criteria in the proposed definition is meant to exclude random acts of

mass violence (e.g., “heat of the moment” homicides and other crimes of passion), thwarted or aborted plans for mass violence, and plans for mass violence that are unsuccessful (e.g., an explosive device that fails to detonate).<sup>4</sup>

The inclusion of wording to reflect the motivations of perpetrators (“influenced by personal vendettas, beliefs, and/or outside ideological sources”) is also meant to further distinguish MCIs from other more commonplace forms of interpersonal violence. In this case, the wording excludes acts of violence without any clear motivation, goal, or justification on behalf of the perpetrator. In other words, we believe that in order to be considered an MCI, the violent act must serve some sort of personal or wider ideological purpose for the perpetrator(s), and the definition thus excludes mass violent incidents caused by criminal negligence, as well as police interventions (i.e., shootouts with law enforcement) in the pursuit of criminal activity. Therefore, the inclusion of this criterion is meant to avoid a definitional weakness called a “net-widening effect,” whereby the definition becomes so broad to the point that it becomes analytically indistinguishable from other definitions of homicide, murder, and other forms of interpersonal violence.

The threshold of four or more victims (including both slain or injured parties, but excluding perpetrator(s)) for the proposed definition is grounded in its widespread usage within discourses on MCIs. While a three-or-more threshold is also often used, a higher bar for inclusion will narrow the scope of any inquiry to more relevant MCIs. While the psychological harm caused by MCIs will likely go way beyond the immediate victims, the definition emphasizes physical harm to the victims as a more salient determinant for inclusion.

---

<sup>4</sup> The proposed definition differentiates between successful and unsuccessful acts of mass violence on the basis that an unsuccessful or thwarted MCI remains wholly a legal/criminal matter, whereas a successful MCI where an act of violence is executed has socio-political repercussions beyond the legal system.

By adding the “discrete” criteria to the proposed definition, we seek to exclude certain types of mass violence that are extended over long periods of time (e.g., serial murderers). By discrete, we mean an event that occurs over a single, continuous period of time without any significant break or interruption<sup>5</sup> to the violent activity or to concrete plans to engage in violent activity. This period of time may include travel time and may occur over one or more locations, provided it meets the aforementioned criteria.

The proposed definition refrains from using any “shooting/shooter” terminology for several reasons. A strong tradition of gun-control within Canada (Brown 2012) both reflects and has resulted in fundamental cultural differences across Canada and the United States regarding gun ownership (McLean 2018). It is undeniable, however, that firearms have played a significant role in Canadian MCIs: as shown in **Table 2** below, the majority of Canadian MCIs from 1970 to 2021 have involved the use of at least one firearm. Furthermore, there is increasing evidence that some of the key differences between Canadian and American handgun ownership have shrunk since 2012. For example, there has been a marked increase in the purchase of handguns in Canada between 2012 and 2017 (Stroebe et al 2021). On the other hand, as several scholars of MCIs have noted, the “shooter/shooting” terminology limits the scope of any inquiry to a single type of violence (Freilich, Chermak, & Klein 2019: 274; Gurian 2017: 1909; Taylor 2018), which is analytically and practically unhelpful, since it may exclude relevant incidents from consideration (e.g., the Air India Flight 182 in 1985).

---

<sup>5</sup> We do not specify an exact length of time for a break or interruption, because this will vary depending on the particulars of each MCI. However, certain behaviours such as fleeing the scene of violence (without any intent to continue engaging in that particular act of violence), surrendering to law enforcement, and so on, constitutes a break or interruption in violence. We consider travelling from one location to another to continue engaging in violence as a single, discrete incident.

Employing the definition outlined above, we have identified a total of 44 Canadian MCIs that occurred between 1970 and 2021 (see **Table 2**). We have included several incidents (highlighted in red) that are slightly below the “four or more” victims threshold in the table, due to their potential to escalate to a deadlier attack, and for more illustrative purposes.

Table 2: Mass Casualty Events in Canada, 1970–2021

Event Date (Y-M-D)	Location	Motive	Violence Type	Location Type	Injuries/ Fatalities	Perpetrator Fatalities
1975-02-14	Brossard, QC	Unidentified grievance (perpetrator/s not found)	Firearm	Nightclub	4/4	
1975-05-28	Brampton, ON	School grievance	Firearms	School	13/2	1
1975-10-27	Ottawa, ON	School grievance	Firearm, knife	House, school	5/2	1
1982-10-14	Toronto, ON	Political grievance (anti-capitalism)	Bomb	Factory	10/0	
1984-05-08	Quebec, QC	Political grievance	Firearm	Government building	13/3	
1984-09-03	Montreal, QC	Religious grievance	Bomb	Inter-city rail station	45/3	
1985-06-21	Montreal, QC	Political extremism (terrorist connections)	Bomb	Airplane (in-flight)	0/329	
1989-12-06	Montreal, QC	Anti-feminism	Firearm, knife	University	14/14	1
1992-02-03	Waterloo, ON	Workplace grievance	Firearm	Manufacturing plant	0/3	
1992-08-24	Montreal, QC	Workplace grievance	Firearm	University	4/1	
1992-09-18	Yellowknife, NT	Workplace grievance	Bomb	Mine	0/9	
1994-09-17	Toronto, ON	Intimate partner dispute	Firearm	Nightclub	4/2	
1996-01-05	Surrey, BC	Intimate partner dispute	Firearm	House	0/4	1
1996-04-05	Vernon, BC	Intimate partner dispute	Firearm	House, hotel	0/9	1
1996-08-01	Gore Bay, ON	Intimate partner dispute	Firearm	House, reserve	0/4	
1997-04-13	Orangeville, ON	Intimate partner dispute	Firearm, arson	House	0/5	1
1997-07-12	Kitimat, BC	Social grievance	Firearm	Park	1/3	
1999-04-06	Ottawa, ON	Workplace grievance	Firearm	Garage	2/5	
1999-04-28	Taber, AB	School grievance	Firearm	School	0/1	
2001-09-18, 2001-09-20	Kirkland, QC	Social grievance	Firearm	Multiple houses	0/6	1
2002-03-11	Quatsino, BC	Intimate partner dispute	Strangulation, firearm	Multiple houses, vehicle	0/6	Perpetrator injured
2002-06-14	Grimbsy, ON	Intimate partner dispute	Firearm	Multiple houses	0/4	1
2006-04-04	Ottawa, ON	Intimate partner dispute	Firearm, bomb	House	0/4	1
2006-09-13	Montreal, QC	School/ social grievance	Firearm	College	19/1	1
2006-10-29	Edmonton, AB	Social/ personal grievance	Firearm	Nightclub	2/3	

Event Date (Y-M-D)	Location	Motive	Violence Type	Location Type	Injuries/ Fatalities	Perpetrator Fatalities
2006-12-10	Halifax, NS	Social grievance	Firearm	Street	1/3	
2007-06-09	Toronto, ON	Social / personal grievance	Firearm	Car	4/2	
2007-08-09	Vancouver, BC	Unidentified grievance (perpetrator/s not found)	Firearm	Restaurant	6/2	
2012-06-02	Toronto, ON	Personal grievance	Firearm	Mall	5/2	
2012-09-04	Montreal, QC	Political grievance (anti-Quebecois nationalism)	Firearm, arson	Theatre (temporary election location)	1/1	
2014-06-04	Moncton, NB	Social / political grievance	Firearm	Multiple public streets	2/3	
2014/10/20-21	Saint-Jean-sur-Richelieu QC	Religious grievance	Vehicle, knife	Parking lot, multiple streets	2/1	
2014-10-22	Ottawa, ON	Religious grievance	Firearm	National War Memorial, multiple street & Parliament Hill locations	3/1	
2014-12-29	Edmonton and Fort Saskatchewan, AB	Intimate partner dispute	Firearm	Multiple houses, restaurant	0/9	
2016-01-22	La Loche, SA	School grievance	Firearm	House, school	7/4	
2017-01-29	Sainte-Foy, QC	Political / religious grievance	Firearm	Mosque	5/6	
2017-09-30	Edmonton, AB	Political / religious extremism (ISIS member)	Firearm, vehicles	Parking lot, multiple streets	5/0	
2018-04-23	Toronto, ON	Anti-feminism (INCEL member)	Vehicle	Street	15/11	
2018-07-22	Toronto, ON	Anti-feminism (INCEL inspired)	Firearm	Street	13/2	1
2019-06-03	New Sudbury, ON	Anti-feminism	Knife	Parking lot	2	
2020-02-20	Toronto, ON	Terrorism (ISIS sympathizer)	Hammer	Street	2/1	
2020-02-24	Toronto, ON	Anti-feminism (INCEL member)	Knife	Spa	2/1	
2020-04-18-19	Multiple locations in Nova Scotia	To be determined (investigation ongoing)	Firearms, arson	Multiple houses, multiple streets	3/22	1
2021-06-06	London, ON	Political / religious grievance	Vehicle	Street	1/4	

\* An exploration of MCIs which have taken place within Canada between 1970-2021 was made through a systematic keyword search of the Canadian Disaster Database generated by Public Safety Canada, in addition to news and journal articles (i.e., New York Times, CBC, etc.).

### **III. Research on the Background Characteristics and Behaviour of Lone-Actor Public Mass Murderers**

The second half of this report analyzes some of the newest research on the backgrounds, characteristics, and behaviours of solo or lone-actor mass murderers. As delineated in the first part of the report, many terms have been used to label these individuals and their actions. The research discussed below all involves what we might term mass murderers' or 'mass casualty incidents' (MCIs), but in examining specific studies other related terms are often used. Much of the literature discusses, for example, “mass shooters” or “mass public shootings” (e.g., Lankford 2018b; Lankford and Silva 2021; Capellan and Anisin 2018; Capellan and Gomez 2018), which is sometimes further differentiated into such sub-types as “school shooters,” “rampage shooters,” and “workplace shooters” (e.g., Lankford 2012; Capellan et al. 2019), or other sub-categorizations such as “ideologically motivated” mass public shootings and shooters (Capellan and Anisin 2018; Capellan et al. 2019) and “lone-actor grievance-fuelled violence” (McCauley, Moskalenko and Van Son 2013; Clemmow et al. 2020). The use of these and other similar terms by different authors indicates a degree of terminological diversity and ambiguity in the field of study that must be acknowledged. No consensus seems to exist, as indicated in the first part of this report, on a definitive terminology. Nevertheless, almost all of the data developed is relevant to what might more generically be called solo mass murderers perpetrating MCIs. We are examining, that is, research related to the actions of individuals, acting largely on their own, whose actions cause mass fatalities (usually designated as four or more deaths) in a public space (i.e., not solely in a domestic context) (e.g., Gill et al. 2017; Gill et al. 2021), no matter where precisely the MCIs occur or by what means.

There are many ways in which a summary of this research might proceed, since the subject has been addressed by scholars from multiple disciplines in somewhat different ways.

Since our research backgrounds, while diverse, are primarily in the study of terrorism and the processes of radicalization leading to attempted or completed acts of mass violence, this analysis is structured in a particular way. It reflects the convergence of research on lone-actor terrorism and public mass murderers, from the vantage point of those studying terrorism (rather than say criminology or public policy). In some respects the analysis traces why and how scholars of terrorism have come to recognize that lone-actor terrorists are in most respects a sub-type of solo mass murderers, and the benefits of merging the empirical insights gained into the characteristics and behaviour of these two phenomena. Accordingly, this is a summary analysis of a body of pertinent research. It reflects the evolution of the research, and while it introduces a degree of analytical order to an array of diverse studies done for different purposes, it does not provide a full meta-analysis, one imposes a more abstracted logical structure. As will become apparent, those working in the field have yet to achieve a higher order of theoretical perspective on their work, and there was insufficient time for us to do so adequately.

The summary analysis is undertaken in four steps. First, we discuss the context giving rise to the research, including the public and academic pressures to better differentiate and explain an array of recent incidents of mass public violence (terrorists and otherwise). Second, we summarize new findings on the prevalence of diverse mental health disorders in the background of different types of terrorists. Third, we examine findings emerging from studies comparing lone-actor terrorists with other kinds of public mass murderers. The findings suggest that these types of perpetrators are more similar than thought, and they might best be differentiated as ideological and non-ideological forms of mass murders. Fourth, and finally, the key takeaways and limitations of this new research are stipulated. As indicated, and will be discussed further below, a key concern of this research has been to determine the relative

presence and role of mental health disorders and ideologically framed grievances in the motivations for the type of solo public mass murders, or MCIs, designated lone-actor terrorism.

### **1. Introduction**

The majority of terrorist attacks and arrests in the West since about 2008 have been instances of so-called “lone-wolf” terrorism, or what most researchers prefer to less sensationally call “lone-actor” terrorism (Borum et al. 2012; Gill 2015: 11-15; Schuurman et al. 2019). Such single-actor attacks are not new, and instances can be traced throughout the history of modern terrorism. The label, which is new, has been used, however, to call attention to the increasing occurrence of these kinds of attacks post-9/11. In recent years, a series of large quantitative studies (discussed below) have significantly improved our grasp of the characteristics of these attacks and their perpetrators. In particular, comparative analyses have revealed that these terrorists do not differ as much as thought from other types of mass murderers. A core issue in these analyses is the relative roles played by ideology and mental disorders in the etiology of these attacks. The second part of this report undertakes a critical survey of these studies to determine what we can now say with some confidence about the background characteristics and behaviours of ideological and non-ideological lone-actor mass murderers. To accomplish this, we focus on and summarize the results of a subset of studies selected from a more extensive research literature now available on aspects of lone-actor terrorism and mass murders.

The designation “lone actor” applies to incidents of terrorism (i.e., ideologically motivated mass casualty events) that appear to have a sole perpetrator of plotted or enacted violence who has no formal relationship with a terrorist organization or group, whether local, national, or international. Such a perpetrator may have had some past or peripheral ties, but those relationships rarely are still operative when the incident occurs, and these groups play no direct

role in planning, preparing for, or carrying out the violence. At most, the broader terrorist organizations or movements seem to play an inspirational role, with perpetrators often claiming their actions were in service of the causes promoted by such movements or organizations. Some of the better known instances are Timothy McVeigh's Oklahoma City bombing (1995), Nidal Hassan's shooting attack on soldiers at Fort Hood, Texas (2009), Andres Behring Breivik's bombing in Oslo and subsequent shooting attack on the island of Utøya (2011), Michael Zehaf-Bibeau's shooting attack and assault of the Canadian Parliament in Ottawa (2014), and Brenton Harrison Tarrant's mosque shootings in Christchurch, New Zealand (2019). In these and many other cases, the significance of ideology in motivating their actions is open to question; and when compared with other terrorists, such "lone actors" are often thought to be driven more by a combination of personal and psychological issues, including, in many cases, the types of abnormal psychology and mental disorders studied by psychopathology (Spaaij 2010; Spaaij 2012; Gill, Horgan, & Deckert 2014; McCauley & Moskaleiko 2014; Gill 2015; Hamm & Spaaij 2017).

In every case, we now know that the turn to violence, whether ideologically motivated or otherwise, is the result of a complex process of radicalization that is multi-factorial and somewhat idiosyncratic for each perpetrator. Researchers have been seeking to identify the relevant factors and processes, whether ideological, social, or psychological, at multiple levels of analysis—macro (societal), meso (group), and micro (personal)—for some time. In other words, they have been delineating how individual motivations are linked with certain structural conditions and influenced by group dynamics in ways that foster the construction of alternative realities that justify or even foment acts of mass violence (see, e.g., Della Porta 1995; Dalgaard-

Nielsen 2010; Borum 2011; Hafez & Mullins 2015; Dawson 2017; Jensen, Atwell Seate, & James 2018; Kruglanski et al 2018; Bouhana 2019).

Identifying these individual and structural conditions and the connections between them is a daunting undertaking, and one of the most fruitful new avenues of research has been the development of larger and more reliable databases on the backgrounds, behaviours, views, and social relations of different kinds of terrorists (e.g., Gill 2015; Corner & Gill 2015a; Gill et al 2017). These databases allow researchers to disaggregate data on different types of terrorists and to better establish the prevalence and patterns of linkages: (1) between a wide array of social and psychological factors and the behaviours of terrorists and (2) between behaviours and types of violent action (with regard, for example, to the targets chosen, the means used, and the results). The creation and study of these datasets also is revolutionizing our conception of the potential contribution of mental disorders to the instigation of acts of terrorism, with implications for the study of other incidents of solo public mass violence in general.

In this vein, criminologists and others have undertaken an array of investigations into the similarities and differences between lone-actor terrorists and other perpetrators of acts of mass violence. The datasets of these comparative analyses are revealing (see, e.g., Lankford 2012b; Capellan et al. 2019; Clemmow et al. 2020). In many respects it appears that lone actor terrorists and other mass murderers are part of a spectrum of perpetrators that is being defined and understood better. As Gill et al (2017) have concluded, “mass murderers look very similar to lone-actor terrorists, perhaps only differing in the ratio to which they are personally versus politically aggrieved” (714). Moving across the spectrum from lone-actor terrorists to mass murderers, levels of ideological commitment appear to decrease, and levels of mental illness to increase—but not in as straightforward a manner as people are inclined to think. Lone-actor

terrorists, like other solo public mass murderers, have often been thought to be more mentally unstable than terrorists acting as a group and with the support of larger organizations (Spaaij 2010; Simon 2013; Corner and Gill 2015a). Until recently, however, this has been an inference drawn from case studies, not the systematic study of larger bodies of data.

## **2. New Research on Mental Disorders and Lone-Actor Terrorism**

The research under scrutiny emerged from two disparate yet convergent discussions that were both public and academic that we address below. It is conditioned more generally, however, by a problematic feature of almost all discussions of MCIs, including acts of terrorism. Since the actions of terrorists and mass public murders are morally repugnant and extraordinary there is a strong impetus to see the perpetrators of such actions as anomalous in significant ways. It is common in the aftermath of these incidents for the actions and actors to be characterized as “crazy,” and this colloquial term invokes the spectre of mental illness as a prime causal factor. The proclivity to think this way is very strong and persistent. Counter-intuitively however, as will be discussed, the research on terrorism tends to show that most terrorists, at any rate, are “remarkably ordinary” – to use the language of a well-known report published by the New York City Police (Silber and Bhatt 2007). This does not mean that some terrorists are not suffering from various forms of mental illness, or that their disorders may not contribute to their violent actions. The links between mental illness and criminal behaviour, and violence more specifically, are complex and open to debate (e.g., Anderson 1997). But our analysis does not imply in any way that mental illness in general is significantly associated with violent behavior, in any direct sense. In most instances it is not. Nevertheless, as Corner and Gill (2015a: 24) state, “the comorbidity of mental illness with other behaviors is well documented across the literature and

include substance abuse (Todd et al. 2004), and violent and criminal convictions (Anderson 1997).”

More specifically, the study of the possible linkages between mental disorders and terrorism grew out of the response to two debates. First, a series of high profile incidents of lone-actor public mass violence caused many to question the classification of some incidents as “terrorism.” At issue was the evidence that mental health issues may have played a significant role in the etiology of these crimes. Such questions have come to fore, for example, regarding Nidal Hassan’s attack at Fort Hood, Texas (2009), Michal Zahaf-Bibeau’s attack on the Canadian Parliament (2014), and Omar Mateen’s attack on a gay nightclub in Orlando, Florida (2016) (e.g., Cox 2009; Zwerdling 2009; Shum 2014; Heer 2014; Ottawa Citizen 2014; Ackerman and Siddiqui 2016; Westbury 2016). Similarly, it is often asked why incidents like Justin Bourque’s rampage shooting of police officers in Moncton, New Brunswick (2014), Dylann Roof’s murder of nine members of a Black church in Charleston, South Carolina (2015), and Alek Minassian’s vehicle ramming attack in Toronto in 2018 are not classified as acts of terrorism (Elmasry & el-Nawawy 2020; Perry & Scrivens 2020; Dolliver & Kearns 2022).

Confronted with these questions, scholars commonly revert to definitional responses to justify why some cases are identified as being terrorism, and not others. Given the lack of consensus on a definition of terrorism (see, e.g., Schmid 2013), however, as well as the significant practical and normative implications of these questions, few are satisfied with this limited approach, and questions arise about the influence of implicit biases (racial and religious) in the classification of these crimes. Examining Canadian media coverage of the attacks perpetrated by Martin Couture-Rouleau and Michal Zehaf-Bibeau, both converts to Islam, and Justin Bourque, a supporter of far-right extremism, Perry and Scriven (2020) argue for example

that “the majority of news sources disregarded a number of key characteristics of each attack and each attacker, and instead constructed countless stories to meet their own rigid profile of a terrorist, as well as ones that met the social threshold of who ought to be defined as a national threat” (2020: 250) Within this framework, they propose, incidents involving Muslims are readily identified with terrorism, while one’s associated with domestic far-right extremism are not.

In each case, much hinges on discerning the presence and relative significance of ideological and psychopathological motivations for the violent acts, yet the data available is not sufficient to reach definitive conclusions. Moreover, it is unclear whether the presence of either factor necessarily discounts the significance of the other. In principle, people suffering from certain mental illnesses can still commit acts of terrorism. Discerning the nature and relative balance of these two factors and the nature of their interactions is often the key to understanding what has happened, and this has prompted new lines of research (e.g., Lankford & Hakim 2011; Lankford 2012a; Capellan 2015), which are summarized below.

Second, researchers have developed new lines of research that are changing our understanding of the relationship between mental disorders and terrorism, and then eventually also lone actor terrorism and other mass murderers, as a result of the failure of efforts to profile terrorists. The pressing need to interdict and counter terrorist plots has driven a desire to differentiate between various types of terrorists and more importantly between potential terrorists and the rest of the population. As criminal profiles had been developed and used widely by law enforcement for serial killers, arsonists, pedophiles, etc. (Kocsis 2006), the development of a terrorists profile has seemed plausible. Three approaches have been taken, focusing on “racial-physical, psychopathological and socioeconomic” parameters (Rae 2012: 1). In this context our

sole concern is with the attempts to develop a psychopathological profile. Racial-physical profiles were never seriously entertained by scholars but are certainly thought to have influenced border security agencies in many countries following 9/11 (Ellmann 2003). Clearly, however, such practices lack the specificity required to identify actual terrorists and involve stereotyping whole populations (e.g., Muslims or Arabs) in morally and politically objectionable ways. Extensive efforts have been made, in diverse ways, to develop a socioeconomic profile, but they have yet to produce anything more than fragmentary and conflicting results (Krueger 2007; Noricks 2009; Piazza 2011; Dawson 2019: 155; Dawson 2021a: 13–22). Efforts to create a psychological profile *per se* have failed as well, as discussed below. In the process, however, we have learned a great deal more about the presence and prevalence of mental health issues amongst terrorists.

Repeated efforts have been made to correlate terrorism with diagnosable mental disorders or personality disorders (see overviews of the research provided by Silke 1998; Victoroff 2005; Kruglanski & Fishman 2006; and Horgan 2014). In the end, however, the traits and behaviours proposed were either too vague or ambiguous, or insufficiently present in the sample of known terrorists. As Silke (1998) concluded some time ago, “the research supporting terrorist abnormality has been sparse and of questionable validity. In contrast, the research suggesting terrorist normality has been more plentiful, and in general, of much greater scientific validity” (62). Nevertheless, some terrorists may be suffering from diagnosable or other less definitive forms of mental illness, and hence it is important to consider if, when, and how this may play an etiological role their violent actions.

### 3. Recent Findings on the Prevalence of Mental Disorders amongst Terrorists

More recent and methodologically sophisticated approaches (e.g., Gill, Horgan, & Deckert 2014; Corner & Gill 2015a; Corner, Gill, & Mason 2016; Corner & Gill 2017) are generating more complete, precise, and interesting findings. These studies develop a more refined, complex, and heterogeneous conception of the correlations between the presence of an array of mental illnesses and different manifestations of terrorism.

For example, Gill, Corner, and colleagues have developed bigger and better datasets that disaggregate the information available on terrorists and types of terrorism, distinguish and track a wider array of behavioural indicators, and employ more sophisticated statistical analyses.

Amongst other things, their research has confirmed the suspicion that mental health issues play a larger but still less than anticipated role in instances of lone actor terrorism than in group-based terrorism. While most terrorists are “normal” in their psychological profiles, many lone-actor terrorists have histories of mental health issues (Hewitt 2003; Gruenewald, Chermak, & Freilich 2013; Gill 2015). Comparing a sample of 119 lone-actor terrorists with 119 group-based terrorists, Corner and Gill (2015a: 26) found that the “odds of a lone-actor terrorist having a mental illness is 13.49 times higher than the odds of a group actor having a mental illness” (Corner & Gill 2015a: 27). The rate of mental illness among lone actors was 31.9% and among group-based terrorists was 3.4% (Corner and Gill 2015a: 27). Lone-actor terrorists who injure people in an attack, for example, are 11.63 times more likely to be schizophrenic and almost 41.6 times more likely to have a mood disorder (Corner & Gill 2015a: 29).

In their study mental illness was coded as a dichotomous variable, but unlike previous studies, care was taken to develop multiple additional variables for the number and name of diagnoses and diagnostic categories. Information on these variables came from extensive examination of the literature available on each actor in the sample. The available literature “was

sourced from the Lexis Nexus database, sworn affidavits, indictments, manifestos, warrants, trial proceeding transcripts, trial memorandums, government and expert witness reports, and competency evaluations” (Corner and Gill 2015a: 26). In each instance, the “diagnosis name was located in the literature, and reliability and quality of the source was taken into account” (Corner and Gill 2015a: 26). A few unclear instances were coded as “nonspecific” diagnosis, for example, when a mandatory treatment order was issued but no confirmed diagnosis specified (Corner and Gill 2015a: 26). Consequently, some of the diagnoses informing the database are from before the individual committed the terrorist offence and some from after, and no specific data are presented on the numbers of either situation.

Many other correlations of the behaviours of lone actor terrorists with the prevalence of mental illness have emerged from Corner and Gill’s analysis as well. “Individuals who injure”, for example, “are 5.1 ... times more likely to have one diagnosis, and 12.5 times ... more likely to have two diagnoses, and 50 ... times more likely to have three or more diagnoses” (2015a: 30). Overall, however, the real numbers of affected terrorists remain small, and there is no way to establish causal linkages based simply on correlations these researchers have observed. Mental illness is more prevalent, though, with lone-actor terrorists focused on single-issue terrorism (e.g., animal-rights, anti-abortion) than with jihadist or far-right terrorism (Corner & Gill 2015a: 31), and the prevalence of mental health disorders amongst group-based terrorists, at 3.4%, is markedly lower than in the general population in most Western societies (Corner, Gill and Mason 2016: 562).<sup>6</sup> The National Institute of Mental Health in the United States, for example,

---

<sup>6</sup> An FBI report on lone-offender terrorism in the United States between 1972 and 2015 stated that 25% of offenders had been formally diagnosed with one or more psychiatric disorders prior to their attack, and another 13% were diagnosed after their attacks: Federal Bureau of Investigations Behavioral Threat Assessment Centre (BTAC). (2019) “Lone Offender: A Study of Lone-Offender Terrorism in the United States, 1972–2015” Department of Justice Report (November 2019), <https://www.fbi.gov/file-repository/lone-offender-terrorism-report-111319.pdf/view>, pp. 22–23.

reported that 21.0% of the U.S. adult population experienced some form of mental illness in 2020, and 5.6% of the adult population experienced what they classify as a serious mental illness (National Institute of Mental Health 2022).<sup>7</sup>

Other researchers (e.g., Faccini & Allely 2019; Erlandsson & Meloy 2018; Sieckelink et al 2019) are seeking to understand more precisely, through case studies, how specific mental disorders play a role in instigating acts of violent extremism, and two further studies have sought to ascertain the prevalence rates of specific disorders (Corner, Gill and Mason 2016 and Gill, Corner, McKee, Hitchen and Betley 2019).

Calling on an expanded version of the database used in Corner and Gill (2015a), Corner et al. (2016: 564) have identified the following prevalence rates in their sample of 153 lone-actor terrorists: traumatic brain injury (1.3%); drug dependence (0.7%); schizophrenia (8.5%); schizoaffective disorder (0.7%); delusional disorder (2.0%); psychotic disorder (0.7%); depression (7.2%); bipolar disorder (3.9%); anxiety disorder (1.3%); dissociative disorder (0.7%); obsessive compulsive disorder (1.3%); post-traumatic stress disorder (PTSD) (3.3%); sleep disorder (0.7%); personality disorder (6.5%); and autism spectrum disorder (3.3%). The three disorders with markedly higher levels of prevalence than in the general population, based on comparisons with data from 13 psychiatric epidemiological studies (Corner et al. 2016: 567), are schizophrenia, delusional disorder, and autism spectrum disorders.<sup>8</sup>

<sup>7</sup> Corner, Gill and Mason (2016) justify their claim by referencing Jordi Alonso et al., “Prevalence of Mental Disorders in Europe: Results from the European Study of the Epidemiology of Mental Disorders (ESEMeD) Project,” *Acta Psychiatrica Scandinavica* 109 (2004): 21-27, and Ronald Kessler and T. Bedirhan Üstün, *The WHO World Mental Health Survey: Global Perspectives on the Epidemiology of Mental Disorders* (Cambridge University Press, 2008).

<sup>8</sup> The inclusion of autism spectrum disorders in this discussion is subject to debate since many would argue that it is not a mental illness or mental health issue, but rather a form of “neurodivergence” that is probably best not grouped with these other disorders. In reporting this data we are merely reporting on the full set of results published by Corner et al. 2016 and not commenting on the relevance or appropriateness of this finding.

Gill et al. (2019: 5–6) discovered, using closed-source police files on 49 individuals who engaged in or planned to engage in lone-actor terrorism in the United Kingdom between 1995 and 2015,<sup>9</sup> that a third of the sample (32.7%) had a history of mental illness or personality disorder. “In the vast majority of these cases,” they state (Gill et al. 2019: 5), the diagnosis was made before the individual engaged in the terrorism-related activities. In this sample they identified the following prevalence rates: mood disorders (12.2%); schizophrenia (10.2%); intellectual disabilities (4.1%); and personality disorders (2%). In every instance, these disorders have a contentious link with violent behaviour, meaning they can lead to violence in certain circumstances, but there is no necessary, intrinsic, or common association with violence. Overall, we have an insufficient understanding of “the social contextual determinants of violence, but research supports the view that the mentally ill are more often victims than perpetrators of violence” (Stuart 2003).

Reinforcing and extending this conclusion, a recent study sought to formulate how three types of mental disorder (namely psychosis, PTSD, and addiction) may be causally related to terrorism. After carefully delineating the many possible ways in which each of these disorders may hypothetically facilitate involvement in terrorism, Al-Atar (2020: 967) has stated:

There is [sic] simply no empirical studies at this stage to suggest any patterns and generalisations in mental illness-terrorism links, and it is not possible or meaningful to assign more or less weight to certain disorders or symptoms than others when assessing risk. There is no evidence base for an actuarial approach to assessing the role of mental illness in terrorist pathways, and there is [sic] no specific guidelines for practitioners on how to formulate the role of mental illness using existent structured professional judgement approaches.

Similarly, a recent systematic review of the research addressing potential links between personality traits/disorders and violent extremism concluded that there is tentative evidence that

---

<sup>9</sup> Coded in accordance with the careful methods to secure coder reliability used in Gill 2015, Corner and Gill 2015a, and other studies by them

some dimensions of personality may play a role in radicalization and terrorism, but overall, the quality and conceptual diversity of the research available is too problematic to draw any clear conclusions (Corner et al. 2021: 395–98).

In another recent systematic review of the literature Gill, Clemmow et al. (2021) identified 25 relevant studies measuring rates of “mental health problems” across 28 violent extremist samples (56).<sup>10 11</sup> In line with the claims made above, this review points to a number of significant if general conclusions:

- (1) “Studies differing in data sources, scientific methods and risk specifications consistently point toward the presence of mental health disorders in a minority of subjects” (Gill, Clemmow et al. 2021: 66).
- (2) Yet there is no simple profile, since the research documents the presence of a wide array of different mental health issues and disorders. In this regard, “terrorist samples are marked by their diversity rather than their homogeneity” (Gill, Clemmow et al. 2021a: 59). No one or small set of disorders is consistently found to be disproportionately present to a significant degree (Gill, Clemmow et al. 2021: 59).
- (3) The data points to a strong distinction, however, between lone-actor and group-based terrorists, with the former marked by a prevalence of mental health issues absent in the latter. The rates of mental health disorders in lone-actor samples, however, “never exceeded 45%” and commonly are much lower (Gill, Clemmow et al. 2021: 67).
- (4) Variations in the prevalence of confirmed diagnoses appear to be dependent on the data sources used. “Where clinical examinations occur (n=236 subjects), diagnoses were present 33.47% of the time. Where studies relied upon wholly, or in some form, upon privileged access to police or judicial data, actual diagnoses occurred 16.96% of the time (n=283

<sup>10</sup> An earlier systematic review by Misia k et al (2019) found only twelve relevant studies, with only a few dealing directly with the possible influence of mental health issues on actual terrorists. (Others dealt with such issues as the vulnerabilities of samples of general populations.) Overall, the review stressed the methodological limitations affecting the reliability of much of the data.

<sup>11</sup> The review excluded studies on personality or personality disorders, because that was being covered by another study, and aimed to assess “the associations, correlates and impacts of mental health problems upon attitudes, intentions and behaviours in the context of radicalisation and terrorism” (Gill, Clemmow et al. 2021: 52). The study notes the multiple problems posed by the different constructs of mental health problems in the 25 studies examined and differences in the data collection techniques. Nineteen of the studies reported on “confirmed diagnosed mental disorders, while the others used a variety of less stringent criteria. Four of the studies based on confirmed diagnoses involved “direct clinical interviews or other associated measures.” One involved clinical self-reports. “Other studies measured mental health concerns indirectly through an investigation of either closed source (n = 4) or open source information (n=10)” (Gill, Clemmow et al. 2021: 58).

subjects). Studies based on open sources (n=1089 subjects) reported 9.82% of the time” (Gill, Clemmow et al. 2021: 58).

- (5) The data reveal that mental health issues co-occur with a range of other stressors, with which they interact in complex ways. Some of the identifiable areas of concern are related to personal life and relationship issues, experiences of discrimination, money/work/housing issues, life changes, health issues, traumatic events, and substance abuse and gambling issues (Gill, Clemmow et al. 2021: 62-66). “Rarely are mental health problems the sole issue. Sometimes mental health problems compound other problems. Sometimes other problems may compound the mental health problems” (Gill, Clemmow et al. 2021: 67).
- (6) All of this provides further support for the consensus view that no two people radicalize in the same way, because of the complexity of the interactions between all the relevant variables. The findings support both the principle of equifinality—“individuals with very different initial states can experience different processes and still end at the same outcome of violent extremism” (Gill, Clemmow et al. 2021: 66)—and the principle of multifinality, whereby “experiencing a single factor may impact upon an individual’s development in very different ways” (2021a: 66). In other words, in any one case, it may be hard to differentiate the relevance of the impact of mental health and other situational factors—a key finding that brings Gill, Clemmow et al. to their most significant conclusion.
- (7) The data in hand stems from studies documenting the presence and, to some extent, the prevalence of certain mental health problems. It does not adequately address the relevance of these problems. To what extent and in what ways do mental health problems play a role in actually determining the behaviors and actions of terrorists, and why do they impact individuals differently? To answer these questions of relevance, as Gill, Clemmow et al. (2021: 69) stress, we need to develop more idiographic research (comparative case studies).

In sum, to date investigations of the links between mental disorders and terrorism have revealed that only a minority (though significant) of terrorists have a history of mental illness, and this group is confined primarily to lone-actor terrorists, especially those classified as single-issue terrorists (e.g., anti-abortion extremists). In this regard, the three disorders that stand out for their disproportionate presence in this population are schizophrenia, delusional disorder, and autism spectrum disorders. As yet, though, little has been established about the nature of the possible linkages between these mental health issues and engagement in violent behavior in general, let alone public mass murder; other than the noteworthy co-occurrence of these disorders with other life stressors. This finding corresponds with the results of other research on mental illness and violence (Hiday 1997; Gilied and Frank 2014). In the general population there

is no noteworthy association between mental illness and violence. Only those experiencing “severe and persistent mental illness” have a higher association with violent behaviour, and largely in circumstances of interpersonal tension and/or social disorganization, such as brought on by poverty and substance abuse (Hiday 1997: 402-405; Gilied and Frank 2014: e5). As Hiday concludes in a review of the research: “For severe mental illness or even active psychosis to lead to violence, social factors must intervene. Neurobiological pathology may be the origin of severe mental illness but social factors affect its course, manifestations, and connection to violence” (Hiday 1997: 411-412). We lack the detailed and comparative case studies required, however, to start delineating and more systematically understand the interactions between severe mental illness and violent behavior in the case of some lone-actor terrorists (i.e., a sub-type of public mass murderers, as discussed further below).

#### **4. Comparative Analyses of Lone-Actor Terrorists and Public Mass Murderers**

Different groups of researchers have undertaken comparative analyses of lone-actor terrorists and mass murderers, often with little direct reference to each other and from somewhat different perspectives. To distill the most pertinent findings without becoming bogged down in procedural or methodological differences, it is advantageous in this context to divide the research into two waves of studies representing initial findings and later developments and refinements.<sup>12</sup>

##### **A. Early Findings**

Studies published by teams of researchers, notably teams led by Lankford, Capellan, and Gill, demonstrate that there are strong similarities in the backgrounds, behaviours, and motivations of

---

<sup>12</sup> In this summary analysis there is no pretense to addressing all of the pertinent literature published in the last two decades. Rather, we focus on some of the most conspicuous and well-known studies. Several are based on more comprehensive critical assessments of the existing literature.

lone-actor terrorists and mass murderers. Lankford and colleagues, however, have grounded these similarities in a conception of these individuals as mentally ill (because they are suicidal) and have suggested that this is the driving factor in their actions. In contrast, Capellan and colleagues, as well as Gill and colleagues, have refrained from drawing such inferences, demonstrating that roughly 40% of these offenders have a history of mental illness and emphasizing the complex and problematic role such a history plays in motivating their violence.

As is often the case, all of these studies call on data about similar but not always identical samples. Lankford and Capellan have focused on mass shooters, while Gill and colleagues have more broadly addressed mass murderers. They also develop some of their datasets using slightly different criteria. In some instances, for example, Lankford has used a three-death threshold designation of mass murders (Lankford 2012b: 258), while Capellan and Gill have used the more common FBI standard of four victims, which Lankford has eventually reverted to as well (Lankford & Cowan 2020: 140). Likewise, Capellan has developed datasets that include individuals who “unambiguously attempted to kill four or more victims,” as well as those who succeeded (Capellan & Gomez 2018: 55; see also Capellan 2015: 397 & 400; Capellan et al 2019: 814).

The differences need to be taken into consideration, but overall, the findings of these researchers have been remarkably similar. Examining the seeming differences and similarities of “rampage shooters” in the United States and “volunteer suicide bombers” in Palestine, Lankford and Hakim (2011), have argued that the tendency to cast American rampage shooters as mentally deranged and Palestinian suicide bombers as normal (if fanatical) reflects the alternative cultural (i.e., interpretive) contexts in which their acts happen rather than the actual characteristics of the individuals involved. Relying on open-source data, they have argued that both sets of offenders

had “troubled childhoods,” lived in “oppressive social environments,” had “low self-esteem,” experienced “personal crises,” and were seeking “revenge” and “fame and glory” (Lankford and Hakim 2011: 99 & 101–5). The findings, however, are very conjectural and, as they admit, “should be considered exploratory” (Lankford and Hakim 2011: 106). Certainly, the problem of specificity intrudes throughout their analysis, since the variables analyzed apply to much broader swaths of the populations than the select few who became violent in these extraordinary ways. We have little knowledge, moreover, of how these factors interact differentially for individuals.

Lankford and Hakim have noted that contrary to the common assumption that suicide bombers are normal, there is “growing evidence ... that at least some suicide bombers displayed classic signs of mental illness before their deaths” (2011: 101). Accordingly, and in line with some of his other studies (e.g., Lankford 2011; Lankford 2018a), Lankford has undertaken further comparative analysis of suicide terrorists, rampage, workplace, and school shooters in the United States (from 1990 to 2010), treating each as instances of “murder-suicide” (Lankford 2012b: 257). In his work, Lankford has assumed that suicidal ideation and behaviour is evidence of mental illness (Lankford 2012b). This study has compared offender characteristics such as age, sex, the presence of social marginalization, family problems, work or school problems, and precipitating crises, as well as attack characteristics such as the number of fatalities and casualties, whether or not the attack involved successful suicide attempts, and if they left suicide notes/explanations (Lankford 2012b: 257). Working with an open-source dataset of 81 attacks (12 terrorist, 18 rampage, 16 school, and 35 workplace shootings), Lankford has found that 76 attacks were committed by lone offenders, all except two of whom were male. With the exception of the school shooters, whose average age was 20.22 years, the average age ranged from 37.11 to 41.16 years. Family problems were detected in 41% to 56% of all perpetrators

except workplace shooters, and work and school problems were common, as was evidence of social marginalization and precipitating crises. Attack characteristics differed little, once data for the 9/11 attack were excluded, and most perpetrators killed themselves after their attacks, with 50–67% of suicide terrorists, rampage, and school shooters leaving suicide notes or explanations of their actions. Only 8% of suicide terrorists, however, engaged in what Lankford has termed “fully self-controlled and self-harming” suicides, and only 11% of workplace shooters left notes (Lankford 2012b: 263). Lankford has concluded:

Overall, there were minimal differences between the suicide terrorists’ personal problems and the problems of the other types of offenders. It was actually the workplace shooters who appeared most different from the other perpetrators of murder-suicide (2012b: 263).

First of all, there were twice as many workplace attacks, and the perpetrators were characterized by fewer family problems but experienced more precipitating crises. They left fewer suicide notes; their attacks involved fewer fatalities; and they were much more likely to kill individuals they felt had victimized them, as opposed to strangers or bystanders (Lankford 2012b: 265).

Capellan (2015) published the first study that compared the overall literature and data on lone-actor terrorists and public mass murderers in general. In line with previous studies of aspects of this issue (e.g., Lankford 2012b; McCauley, Moskalenko, & Van Son 2013), he too has demonstrated that “ideological” and “non-ideological” offenders look alike. Most are “white males in their 30s, with rather dysfunctional adult lives. They tend to be single/divorced, unemployed, have low levels of education, and suffer from mental illness” (Capellan 2015: 407). In fact, in his sample of 282 cases between 1970 and 2014 in the United States, he has found approximately 50% of the cases involved “confirmed or suggested mental illness” (402). Both ideological and non-ideological offenders attacked places to which they had authorized access; the events ended within 60 minutes; and they ended with “self-contained or self-harming

suicides” (Capellan 2015: 405). (Unlike Lankford, Capellan has included in this category being killed in the act by the police or others.) The ideological offenders (i.e., lone-actor terrorists), however, were more likely to have “blue-collar jobs” and criminal records. They also engaged in significantly higher levels of planning and were more likely to train for their attacks and research their targets. There is less evidence of precipitating events for them, and they were more likely to attack people and places with which they had no prior relationship (Capellan 2015: 401–3). These findings have led Capellan to suggest that ideology plays a significant role in the preparation for, execution of, and conclusion of their attacks (407).

Gill, Silver, Horgan, and Corner (2017) have produced a more exacting analysis based on “the richest (in terms of size and breadth of variables) dataset of its type,” focusing on 115 mass murderers from 1990 to 2014 in the United States. The results of their analysis reflect many aspects of the findings of Lankford and Capellan but with many more variables and more precision (see especially Gill et al 2017: 711–13).<sup>13</sup> In terms of demographic characteristics, the mass murderers in their sample were overwhelmingly male, with relatively low educational attainment (only 24% had some experience of university). 28% were unemployed, 33% worked in service or administrative jobs, and only 5% were professionals. 43% were single, 17% married, and 13% divorced. 43% had previous criminal convictions but for a wide range of offences, so no one offence stood out as an “escalatory trigger.” 18% had some military experience, but only 2% had actual combat experience. In terms of more complex factors, 63%

---

<sup>13</sup> Gill et al. (2017) have also discussed the problems posed by the diverse and somewhat arbitrary criteria used in similar research to differentiate offenders by motives, types of weapon, or the number of victims. Alternatively, they have offered a rationale for defining public mass murderers as individuals who perpetrate crimes with four or more victims (excluding the perpetrator) at one or several geographically close locations over a relatively short period of time. Mass murders committed by gangs, terrorist groups, or criminal organizations, or that were solely instances of domestic violence are excluded from the category of mass public murders. This definition is more or less the consensus view now, and Capellan has advanced much the same definition for “mass public shootings”—technically a more specific sub-type (Capellan et al. 2019: 814).

had experienced long-term stress (ranging from academic, employment, and business failures through disabling injuries and diverse mental health issues). 44% had histories of substance abuse, and 41% had diagnosed mental health disorders. “At least eight of the offenders had previously tried to kill themselves, while many others regularly spoke of a desire to kill themselves” (Gill et al 2017: 712). 26% appeared socially isolated, and 24% lived alone.

In addition, the examination by Gill et al. (2017) of the prevalence of behaviours of mass murderers in the time nearing the event highlights the importance of short-term situational risk factors. This includes such experiences as being recently unemployed, being degraded or the target of a perceived act of prejudice, problems with personal relationships, financial problems, and elevated levels of stress in general (Gill et al. 2017, see Table 1: 712). Measured in periods of two years, one year, and six months before the attack, the significance of events in the six-month period stand out, though the presence of these issues is significant throughout.<sup>14</sup>

In line with the data Gill (2015) collected on lone-actor terrorists and as indicated by previous studies of adolescent mass murderers (Meloy et al 2001) and school shooters (Vossekuil et al 2002), a surprisingly high percentage of mass murderers leak information about their intentions and plans (Gill et al. 2017: 712). Without summarizing all the data reported in Table 2 of this study (2017: 713), in 46% of the cases others were aware of the perpetrator’s grievances, 31% of the mass murderers made verbal statements to friends and family about their intent or beliefs, and in 17% of cases, at least one other person knew of the individual’s research,

---

<sup>14</sup> The Violence Project, a non-profit organization, reports that of 180 American mass shooters, over 80% were in noticeable crisis prior to their shootings: 40.6% for years beforehand, 29.7% for months, 15.9% for weeks, and 13.8% for days. Most of the shooters in crisis exhibited one to four symptoms. However, over one third showed five or more signs of a crisis (i.e., 66.9% exhibited increased agitation, 41.9% a abusive behaviour, 39.5% isolation, 33.1% losing reality, 29.7% depressed mood, 27.3% mood swings, 24.4% inability to do daily tasks, and 23.8% paranoia). See the Violence Project (2022) “Key Findings.” Data visualizations (accurate through 2019), <https://www.theviolenceproject.org/mass-shooter-database-3/key-findings/> (accessed 21 February 2022).

planning, and preparation for the attack. 12% of the murderers produced public statements prior to the attack, and 19% issued a pre-event warning.

Despite the array of data, Gill et al. (2017) have observed that it is difficult to gain insights into the motivations of perpetrators. They have stated, however, that “56% held a grievance against a particular person or entity” (713). The list of grievances is wide-ranging, involving government institutions and officials, neighbours, former employers and co-workers, family members, acquaintances, service providers, specific sets of people (e.g., homosexuals), and other vaguer categories (e.g., “rich snobs”) (Gill et al. 2017: 713). They have noted that many offenders “appeared obsessed about other issues unrelated to their grievance,” such as “serial murders, death, food additives, former girlfriends, female neighbors, celebrities, firearms, and the causes of ill-health” (Gill et al. 2017: 713).

Finally, Gill et al. (2017) have noted that “there are a couple of other event-related behaviours that produced interesting results” (713): 79% knew the location of the attack well, often because it was where “most of their routine activities” happened (e.g., school or work); 85% pre-conceived and planned their attacks; and 20% consumed alcohol or drugs just prior to the attacks. Moreover, 53% died in their attacks, and Gill et al. (2017) say rather ambiguously “All but 13 of those cases were suicide, the rest being death by cop” (713). This figure is significantly lower, it is worth noting, than Lankford’s findings (2012b: 262). Lankford (2012b) reported that 67% of suicide terrorists, 89% of rampage shooters, 69% of school shooters, and 91% of workplace shooters, had completed suicide successfully.

The concluding remarks of Gill et al. (2017) regarding their detailed set of findings are worth quoting at some length:

[M]ass murderer attacks are usually the culmination of a complex mix of personal, political, and social drivers that crystalize at the same time to drive the individual down the path of violent action. Whether violence comes to fruition is usually a combination

of the availability and vulnerability of suitable targets that suit the heady mix of personal and political grievances and the individual's capacity to engage in an attack from both a psychological and technical capability standpoint. Many individual cases share a mixture of unfortunate personal life circumstances coupled with an intensification of beliefs/grievances that later developed into the idea to engage in violence. What differed was how these influences were sequenced. Sometimes personal problems led to a susceptibility to ideological influences. Sometimes long-held ideological influences became intensified after the experience of personal problems. This is why we should be wary of monocausal master narratives (e.g., it was caused by mental illness). The development of these behaviors is usually far more labyrinthine and dynamic (Gill et al. 2017: 713).

In most cases, they have stressed, the risk factors have been at play for a long time, more recent situational stressors have a “multiplier effect” on them, and “the trajectory into violence” is a lengthy process (Gill et al. 2017: 714).

#### B. Later Research and Developments

In line with other scholars, Lankford has also argued that the “mass shooter–suicide terrorist distinction might no longer be meaningful” (2018b: 472). In contra-distinction to Gill et al. (2017), however, he has argued that this is because mass murderers and lone-actor terrorists are both—and probably equally—driven by mental illness, as demonstrated by the suicidal nature and consequences of their actions. His circular reasoning in this regard is unique and problematic. He first succinctly stated this thesis in an op-ed in the *New York Times* (Lankford 2012a) and then in a subsequent series of academic publications. In particular, Lankford has stressed that all public mass murderers, including lone-actor terrorists, share three “factors,” all of which we would say are really motivations: “(a) suicidal motives and life indifference, (b) perceived victimization, and (c) desires for attention or fame” (2018b: 472). Relying on evidence derived from open sources, including the notes, manifestos, and videos left behind by attackers, Lankford has pointed to the presence of these “factors” and maintained that they are of primary importance, but he provides no precise data on the prevalence and relevance of these factors. Moreover, he has acknowledged the problem of “false positives,” which is really another instance of the problem of specificity:

Even if most public mass shooters and suicide terrorists exhibit some of the warning signs provided here, that does not mean that everyone who exhibits some of these warning signs will inevitably become a mass killer (Lankford 2018b: 474).

In fact, a great many people will display these three “warning signs” and not become public mass murderers (Mulvey & Cauffman 2001; Fox & DeLateur 2014: 134). Nonetheless, Lankford has argued that the potential harms caused by failing to identify a potential mass murderer outweigh the risks associated with falsely identifying someone as a potential mass murderer. Given the complexities of the situation, as outlined by Gill, Clemmow et al. (2021), it seems fair to say Lankford has significantly underestimated the number of false positives that could result from acting on these three limited “warning signs.” Consequently, we caution against accepting his point of view.

Capellan has augmented his initial analysis with several additional quantitative studies, two of which are examined here: (1) Capellan and Gomez (2018) and (2) Capellan et al (2019). Both of these studies have addressed changes in the characteristics of “public mass shooters” (the subcategory the research focuses on) over time. The authors have developed open-source datasets of such shootings in the United States (Capellan and Gomez 2018 examined 294 shootings from 1984 to 2015; Capellan et al 2019 addressed 319 shootings from 1966 to 2017). Capellan and Gomez (2018) compared data from the last sixteen years of the twentieth century (1984–99) with data from the first sixteen years of the twenty-first century (2000–15). The results reveal that the basic profile of such shooters has remained consistent in many respects: they are overwhelmingly male, predominantly white, in their 30’s and hence older than most criminals, largely single or divorced, have high school or less education, high levels of unemployment, and abnormally high levels of mental illness and substance abuse. Most attacks are “lone-wolf” ones, in locations the attackers are familiar with, and the events are sudden, chaotic, and end relatively quickly (“the overwhelming majority end in less than 30 minutes”,

Capellan & Gomez 2018: 65). Also, “the average number of fatalities and injured victims has remained stable ... (at about 3 fatalities and 3.4 injured victims)” (65).

Nevertheless, Capellan and Gomez (2018) detected significant changes as well: more of the shooters are non-white, more are married or in a relationship, a bit older, have some college education, and are employed (59–60 & 63). There are changes in the attack characteristics as well: they are significantly more likely to be traced back to a precipitating event, and surprisingly, given the onset of social media, there is “a significant decrease in the proportion of offenders who discuss their plans” (61).

These findings have been more or less confirmed by Capellan et al. (2019), which examined 318 mass public shootings in the United States between 1966 and 2017, but the data on “disgruntled employee shootings,” “school shootings,” “ideologically motivated” and “rampage shootings” is disaggregated. The results reveal that 36.1% of the mass public shootings were rampage shootings, 29.8% were disgruntled employee shootings, 19.1% were school shootings, and 14.7% ideologically motivated. Over time, school shootings have been declining, ideologically motivated ones have remained stable, and rampage and disgruntled employee shootings have grown. (Rampage shootings, however, is more or less a residual category, encompassing instances not readily assigned to the other categories.) Capellan et al. (2019) have found no significant differences in the educational backgrounds of these shooters: 70% have no more than high school-level education.<sup>15</sup> Likewise, the levels of confirmed or suggested mental illness was approximately 40% for all the categories. What differs, unsurprisingly, is that school shooters were much younger and almost all single, and disgruntled employees were more likely

---

<sup>15</sup> Of course, this figure also demonstrates the “remarkably ordinary” character, in many respects, of public mass murderers, since as the U.S. census reveals that 33.4% of Americans had a bachelor degree or higher in 2016.

to be unemployed (65.9%). Ideologically motivated and rampage shooters were far more likely to have criminal records (48.9% and 40.1% respectively), and the ideological shooters were more likely to be active or former military (27.6%).

In sum, three things stand out from the studies by Capellan and Gomez (2018) and Capellan et al (2019). First, the consistency of the gender variable: the fact that almost all offenders are male warrants much greater study, as Capellan et al. has recommended (2019: 822). Second, the increase in disgruntled employee and rampage shootings means that more attacks are less planned, stem from the acute strain of precipitating events, guided by a revenge motivation (in 83.1% of cases), with a higher percentage of non-white perpetrators. These attacks, however, have a lower level of fatalities and injured victims, probably because of their more impulsive nature. Third, overall the shooters have commonly experienced a number of difficulties in life in terms of high levels of being single or divorced, unemployed, low levels of education, and high levels of mental illness and substance abuse.<sup>16</sup>

Gill and colleagues have extended their analysis as well. Gill, Silver et al. (2021) once again have compared lone-actor terrorists and public mass murderers, with a dataset of 71 terrorists and 115 shooters in the United States between 1990 and 2014. The analysis covers 180 variables, using bivariate and multivariate analyses, and largely confirms their earlier findings. They have examined sociodemographic characteristics and behavioural differences, dividing the

---

<sup>16</sup> Recognizing the insufficiency of the conventional categories used to sort such shootings, Capellan et al. (2019) have suggested regrouping mass public shootings as either “autogenic, revenge, or ideological” (817; see also Capellan & Gomez 2018: 53–54). This typology is derived from the application of script analysis and rational choice theory to mass public shooter cases (Osborne & Capellan 2015). These new labels are fairly self-explanatory, and they mean the changes noted involve increase in revenge motivated attacks (e.g., workplace shootings) and a decline in autogenic ones (e.g., school shootings)—ones where the attacks are motivated more by “self-generated” internal reasons. The adequacy of this classification is questionable, however, since the key factor in revenge attacks is the way individuals interpret and respond to precipitating events. The labels “autogenic,” “revenge,” and “ideological” are not logically of a kind either, so the analytic advantage of Capellan’s new categories remains relative at best.

latter into group-related activities, antecedent attack behaviours, and leakage-related behaviours, concluding:

Overall, our data inform the emerging idea that lone-actor terrorists and public mass murderers are not distinct offender types. There is more that unites them than divides them. Although the over-arching focus of our results are the few variables that distinguish them, the vast majority (>80%), of the 180+ variables showed no significant difference. For the most part, they are similar people, with similar mobilization pathways, committing similar forms of violence, with slightly dissimilar motivational structures. Even motivational structures are difficult to demarcate. Although lone-actor terrorists are ideologically influenced, in many cases we see these influences combine with deeply personal grievances to shape aspects of their decision-making ... [and] ... we often see [mass murderers] frame their respective grievances in politicized language ... (Gill, Silver et al. 2021: 5)

Both types of offenders continue to be overwhelmingly male, have an average age of 34 years, and tend to be single or divorced (lone actors 53%; mass murderers 56%) (Gill, Silver et al. 2021: 3). Lone actors, however, have been found to be significantly more educated than mass murderers, with two thirds of the former participating in some form of university education compared to 24% of the latter.

In terms of behaviours, Gill, Silver et al. (2021: 3) have found that lone actors are significantly more likely to: (1) try to recruit co-offenders; (2) interact with co-ideologues, virtually and in-person; (3) produce letters and/or public statements prior to the attack; (4) recently have joined a wider movement; (5) have military or combat experience; (6) have criminal convictions; (7) experience a tipping point in their radicalization; (8) change address prior to the attack; (9) live alone and be socially isolated; (10) engage in dry runs/hostile reconnaissance; (11) demonstrate that their anger is escalating; (12) possess a stockpile of weapons; (13) verbalize their intentions to friends/family/wider audiences; (14) have others aware of their grievance; (15) express a generalized desire to hurt others; (16) have others involved in procuring weaponry; and (17) have others aware of their attack planning. As for mass murderers, Gill, Silver et al. (2021: 3) have found that they are significantly more likely to:

(1) have a history of substance abuse; (2) experience being degraded, treated poorly, or victimized; (3) have problems with personal relationships; (4) experience both recent and chronic stress; and (5) have a history with the event location.

In comparing lone actors with public mass murderers, Gill, Silver et al. (2021) have found no significant differences in (1) the prevalence of mental health disorders (39% versus 41%); (2) the experience of financial problems in the two years prior to the attack (both 25%); and (3) making specific pre-attack warnings (26% versus 19%).

In these findings we can see tendencies, but it is hard to know what is consequential. It appears, for example, that lone-actor terrorists are less alone than mass murderers and, accordingly, also share more information about their intentions prior to acting on them. But as Gill, Silver et al. have cautioned, “half of the lone-actor terrorists were as ‘lone’ as the non-ideologically motivated public mass murderers” (2021: 5). Likewise, just because a public mass murder is not explicitly identified with an ideological reason does not mean there is not one, since “over a quarter of public mass murderers had some form of ideological aspiration, albeit poorly articulated, fanciful, or lacking a wider milieu of support” (Gill, Silver et al. 2021: 5). In other words, what emerges again is the complexity of the etiology and the similarity of the two types of assailants.

The research on this topic is relatively new and subject to certain methodological limitations. For example, the datasets have not been representative samples and thus far have not been complete ones, and they have largely been derived from open sources. Such sources are inevitably subject to some selectivity bias, and this means some variables are over-reported, while others are under-reported. Some of the data utilized on mental health problems has not been the result of the application of standardized assessment tools, and when it has been,

different tools may have been used. Many of the studies are limited by the fact that they sampled on the dependent variable. They have studied only individuals who were lone-actor terrorists or mass murders without a control group or the use of other relevant comparative data (e.g., general population data). The studies by Gill and colleagues have sought to make comparisons with national figures wherever possible, and they have implemented more elaborate means of coding and inter-coder reliability testing to compensate for these limitations. Nevertheless, the sub-Ns for many variables remain small relative to the overall sample. These limitations do not invalidate the findings; they simply mean caution must be exercised in drawing strong conclusions.

#### IV. Summary Observations and Conclusions

Overall, we think there are eleven primary takeaways from this analysis.

*(1) The research available on MCIs is characterized by a breadth and diversity of approaches and terminology, resulting in considerable ambiguity and lack of definitional clarity.*

We have identified 64 different terms that play a role in the conceptualization of MCIs. These terms can be organized in terms of four overlapping criteria: the scale of an MCI, the motivations for an MCI, the nature of an MCI relative to other crimes, and the genre of the MCI. Analysis of the ambiguity in the literature further suggests it stems from differing opinions on the timing/location, deadliness, visibility, success, and method of the violent incidents.

*(2) On the basis of a careful examination of the research, we recommend the use of the following definition of mass casualty event:*

A premeditated and successfully executed act of violence where one or more perpetrator(s) influenced by personal grievances, beliefs, and/or outside ideological sources physically injure and/or kill four or more victims during a discrete period of time.

(3) *There is a dearth of research available on Canadian MCIs, yet we have identified, using the above definition, at least 44 MCIs in Canada between 1970 and 2021 (see **Table 2**).*

(4) *There is a broad profile for the perpetrators of MCIs.* Studies have consistently found that public mass murderers are overwhelmingly male, predominantly white, and have an average age in the mid- to late thirties. The majority are single or divorced, have relatively low levels of education (high school or less), and about 40% have a previous criminal conviction and a history of diagnosed mental health issues. A sizable minority, about a quarter, are socially marginalized and unemployed, and most have experienced a number of stresses and strains in their lives, ranging from problems at school or work, in relationships, with their finances, or from discrimination for years but particularly in the six months preceding their attack. While some have displayed suicidal tendencies (accurate figures not available), there is insufficient reason to posit a desire to die as a significant motivation for their attacks, especially in the case of lone-actor terrorists. If death was the primary objective, there are easier ways to achieve it than planning and perpetrating a mass murder.

(5) *There have been some changes in the basic profile of perpetrators.* The research suggests that in recent years the profile of those perpetrating MCIs has shifted somewhat. More are non-white, married or in a relationship, a bit older, have some university/college education, and are employed. In addition, more of the attacks are revenge motivated, less planned, and more directly related to precipitating events than in the past. However, these changes reflect a broadening of the basic profile more than a significant shift in the nature of the acts and perpetrators. In other words, rather than a shift in the nature of the phenomenon of mass public murder *per se*, such changes may be a reflection of recent demographic and historical trends, such as the aging of baby boomers, more racially diverse populations, higher general levels of

education, and the impact of such major incidents as the financial crisis of 2008 (and more recently perhaps the COVID-19 pandemic).

Disconcertingly, however, as the data reveals, a sizable portion of mass murderers do not conform to even the broad profile, with the exception of their gender (i.e., being men), and this needs to be taken into consideration. In a relative sense, that is, we now reliably know much more about most of the perpetrators of MCIs, but in real terms, the profile remains weak. We know not everyone is equally at risk of engaging in such violence, and we know which factors should be the focus of our attention, given their disproportionate presence (e.g., history of mental illness). Yet many perpetrators diverge from the broad profile in one or more key respects and, most importantly, we are faced once again with then problem of specificity: the profile applies to a much wider segment of the population than those who engage in acts of mass public violence.

(6) *The process of becoming a mass public murderer is characterized by equifinality and multifinality.* A multitude of factors may influence why any one individual turns to violence, and the interplay of these factors may be more important than their mere presence. These facts, along with the role of countless contingencies in precipitating violent behaviour, mean that it is not possible to trace a typical path to violence in anything other than very general ways. The principles of equifinality and multifinality apply. Individuals with very different initial states can experience different combinations of factors yet still end up engaging in acts of mass violence (i.e., equifinality), and the experience of a single factor may impact differently upon individuals yet produce the same violent result (i.e., multifinality). In other words, individuals with different initial situations will experience a range of factors that interact differently to contribute to their violent behaviour, and different people in similar initial situations will experience different

outcomes, as a result of experiencing a single factor differently (Corner forthcoming: 10–11). It is this situation that underlies, in part, the ongoing problem of specificity.

This does not mean, however, that we can only differentiate mass murderers from the rest of us by their final violent actions. In a relative sense, mass murderers can be distinguished, and individual risk assessments could possibly be developed, with sufficient information. There is, however, an extensive research literature on the development and implementation of such threat assessments, one's specifically focused on interpersonal violence of all types, that far exceeds our expertise or the parameters of this report (see, e.g., the well respected journal *Threat Assessment and Management*, a publication of the Association of Threat Assessment Professionals and the American Psychological Association).

(7) *Lone-actor terrorists are much like other public mass murderers yet still distinct by degree.* The similarities between lone-actor terrorists and other types of public mass murderers have been demonstrated by the studies addressed in the review above. The delineation of these similarities is consequential because it broadens the empirical base for the study of this phenomenon overall and augments our understanding of the role of non-ideological factors in terrorism and ideological factors in other instances of public mass murder. We can no longer separate the two by assuming that terrorists are primarily “normal” (i.e., not suffering from a mental disorder) and driven by ideology, while most public mass murderers are mentally ill and non-ideological. Much about the role of these factors in each case, however, has yet to be empirically investigated and clarified.

In the case of lone-actor terrorists there is an increasing appreciation that ideology may play a more important causal or mediating role, or both, than presumed by many researchers, at different points in the process of radicalization (Holbrook & Horgan 2019; Dawson 2021 b: 13–

16), and to different degrees for different individuals. Gill, Silver et al. (2021: 5) make a similar claim for public mass murderers, arguing “in the aftermath of a public mass murder not ‘claimed’ by any terrorist organization, investigators should not discount the possibility that the offender was motivated at least in part by political, religious, or ideological concerns ... (over a quarter of public mass murders had some form of ideological aspirations, albeit poorly articulated, fanciful, or lacking a wider milieu of support).” Weak or strong, the functioning of the ideology is subject to the same considerations as the role of mental illness (see #8 below).

When present to any significant extent, ideology is correlated with consistent differences in the characteristics of offenders and their attacks: ideological public mass murderers tend to be less likely to have a history of mental illness (roughly 30% versus 40% of those without ideological motivations), and their attacks are more planned, more lethal, more likely to target people they do not know, and less likely to be affected by precipitating events. There also is more leakage (i.e., divulging information about their grievances, intentions and plans to other people). The reduced presence of mental illness and the greater amount of leakage probably stem from the fact that even lone-actor terrorists are less socially isolated and perhaps less marginalized as well, because they have some links with others who share their ideological orientation (off- and online).

The findings of Gill, Silver et al. (2021) suggest that it would be best to adopt a dimensional approach to differentiating lone-actor terrorists from other types of mass murderers. In this regard, they have recommended the approach advanced by Borum, Fein, and Vossekuil (2012) to distinguish lone-actor terrorists from other terrorists:

[Those authors] make the case that instead of focusing on typologies of lone-offender terrorists (e.g., based on whether the offender received material support or acted under a formal command and control structure), it may be more useful to view (a) the degree of loneness the offender exhibited, (b) the degree of external direction the offender

received, and (c) the depth of their political motivation, as continuums (Gill, Silver et al. 2021: 5, referring to Borum, Fein, & Vossekuil 2012).

These dimensions apply equally well to differentiating lone-actor terrorists from other mass murderers. Group-based terrorists, lone-actor terrorists, and mass murderers form a spectrum, with lone-actor terrorists being somewhere in the middle of the continuum, and being more lone, less directed, and less ideological than group-based terrorists, and less lone, more directed, and more ideological than other mass murderers. The poles of this continuum are Weberian ideal types that rarely exist in reality and merely serve as heuristic devices for anchoring the continuum. Almost all real cases would be plotted somewhere along the continuum.

Figure 1. Continuum of Types of Public Mass Murderers

Even when the presence of an ideology is detected, however, in either lone-actor terrorists or solo mass murderers, we must keep in mind the sequence and relative primacy of personal and ideological motivations.

Many individual cases share a mixture of unfortunate personal life circumstances coupled with an intensification of beliefs/grievances that later developed into the idea to engage in violence. What differed was how these influences were sequenced. Sometimes personal problems led to a susceptibility to ideological influences. Sometimes long-held ideological influences became intensified after the experience of personal problems. (Gill, Silver et al. 2017: 713)

Ideology has a consequential role to play, though, even when it is not the source of grievances and merely the frame used to make sense of the grievances and to direct the attention and energies of the perpetrator (i.e., playing a mediating role). An ideological worldview can be instrumental in mobilizing an individual to take action, in part by providing a justification that transcends the personal. It makes a linkage between personal troubles and political, religious, social or cultural objectives and causes (Maynard 2014 & 2019; Holbrook & Horgan 2019).

(8) *A large minority of mass murderers have a history of mental illness, but the role of mental illness in influencing or precipitating their violence is complex and unclear and must be determined on a case-by-case basis.* As far as we can currently tell, based on the data about diagnosed mental disorders available in open sources of information, a significant minority of mass murderers have a history of some mental illness, and there is some data linking them to specific mental disorders. The data reveals, however, the presence of a wide range of disorders, without any one disorder or set of disorders having particularly strong correlation with particular offenses. Furthermore, approximately 50–60% of offenders have no demonstrable history of mental illness. Lankford’s categorical association of mass murderers with mental illness by virtue of the suicidal nature of most of the attacks (see section III-4 above) is too facile. (Fully establishing this point, though, requires specific argumentation that exceeds the scope of this limited review.)

In the end, Corner’s understanding of the role of mental disorder in terrorism seems apt for psychopathology and mass public murder in general (with the proviso that its presence in the latter is greater):

... [I]t is extremely unlikely that psychopathology alone is the cause of radicalisation. Even for those who, at some point, suffer from mental health problems and ultimately become radicalized, the role of these disorders or traits will differ across cases, and they

will be mediated by a wide range of other experiences and situations. A single specific disorder will likely have a different impact on different people. Sometimes mental health problems may compound other problems. Sometimes other problems may compound the mental health problems. It is also possible that underlying psychopathology mediates other factors and [may] move individuals away from radicalisation, or there may be differences in specific disorders and traits between those who become radicalised and those who act violently (Comer forthcoming: 11).

As stated, the principles of equifinality and multifinality apply, and as Comer has commented, it is important to note that the presence of mental disorders are as likely to inhibit a turn to violence as prompt it. This is why, as Al-Atar (2020: 967) concludes, it is extremely difficult to assign more or less weight to certain disorders or symptoms than others when assessing risk.

In this regard, more generally, behaviour itself is not always a reliable indicator of the presence or absence of mental health disorders and their relevance to mass public violence. Counterintuitively, for example, analyses of the behaviour of lone-actor terrorists suggest that the presence of mental illness had little impact on the likelihood or ability of unwell individuals to engage in the same kinds of pre-attack planning and preparations as those without any mental health issues (Gill, Horgan, & Deckert 2014; Comer & Gill 2015b).

(9) *A high percentage of MCIs are carefully planned.* With the partial exception of workplace shooters and perhaps rampage shooters (who largely form a residual category for public mass murderers who do not fit the other categories), most perpetrators research and make preparations for their attacks for some time—at least several months and often years. It is difficult to say with the data in hand, however, whether they would have acted on their plans absent certain more recent precipitating experiences.

(10) *A significant minority of the perpetrators of MCIs engage in leakage, which may provide an effective avenue for detection and prevention.* Every study has found that 30%+ of perpetrators make statements to friends and family members about their beliefs, intentions, and

plans. In some instances, the levels of leakage (or “attack signaling”) are very high. Meloy et al. (2001), for example, found that 44% of their sample of adolescent mass murderers in North America discussed the act of murder with at least one other person before acting. This indicates that there may be scope to intervene in many cases before the situation becomes violent. Potential MCIs, then, while rare, are not strictly as undetectable as commonly thought (Gill, Corner et al. 2019: 12).

However, there are significant and as yet not fully studied reasons why this information does not come to the attention of the authorities. Friends and family members, the most likely to be aware of this information, “may feel restrained from acting because of love and loyalty or concern about the consequences” (Borum 2013: 108). Therefore, as Borum (2013: 109) states:

Finding ways to encourage concerned people to come forward and to facilitate reporting will be critical to long-term prevention efforts. No quick fix is available, but research on reporting systems has shown that it helps to have multiple channels and options for reporting unacceptable behavior, including anonymous reporting mechanisms (Colvin, 2011). As a general guideline, bystanders are more likely to report concerning behaviors when they perceive the reporting mechanism to be accessible, safe, and credible (Rowe, Wilcox, and Gadlin, 2009).

We are aware of some similar research that has been undertaken into the reluctance of Muslim communities to report members suspected of terrorist activities to the authorities (e.g., Grossman 2015; Thomas et al. 2017), but we lack the expertise to comment further. Overall, though, the leakage also indicates that these perpetrators are simply less alone than previously thought, and hence it may be easier to detect their attack intentions and preparations, and potentially interdict their actions, than is commonly thought (Gill, Corner et al. 2019: 12; Schuurman et al. 2019; Hofmann 2020).

(11) *A defining motif of the behaviour of perpetrators of MCIs is an atypical preoccupation with grievances.* Again, there is no uniformity in the kinds or number of

grievances held by public mass murderers, and the problem of specificity applies in spades since many people hold similar grievances yet do not engage in violence, let alone perpetrate a mass murder. Nevertheless, case histories and the research discussed in this report create the impression that most mass murderers nurture grudges with an intensity and longevity that seems exceptional. They perceive themselves to be the victims of the unfair or unjust actions of specific others, and they feel called upon to rectify this humiliating situation through acts of vengeance, often because they feel their complaints have gone unheeded. For ideological offenders, the grievances are fraternal: they are linked to a group that the offenders can identify with. For non-ideological offenders, the grievances are more egoistic, to use the language of relative deprivation theory (see Smith & Pettigrew 2015). This is seemingly why McCauley et al. (2013), Corner et al. (2018) and Clemmow et al. (2020) favour using the term “grievance-fueled targeted violence” as an umbrella term for discussing all types of public mass murder.

This is an impression, however, and at this time it is unclear how it could be confirmed or tested (or whether someone has attempted). Gill, Corner et al (2019), working with strong closed source data on lone-actor terrorists provided by the British government, coded eight behaviors that they think indicated that individuals held grievances: “whether they published letters or other posts outlining the grievance, made verbal statements to friends and family, made verbal statements to wider audiences, whether others were aware the individual’s anger around the grievance was escalating, whether a bystander was apparent, and whether the individual experienced a recent stressor” (2019: 13). No rationale for all these measures is provided, and the links seem indirect or unclear in a few cases, but they note that all but three of their 49 individuals displayed at least two of the indicators, and 28 displayed five or more.

(12) *We need more research not just on the presence and prevalence of psychopathology and the other social factors for the emergence of MCIs but on the direct relevance of such factors.* The studies reviewed above provide data on the presence and prevalence of factors such as mental health problems, but they do not directly address the relevance of these factors or the different reasons and ways in which they might be relevant (Gill, Clemmow et al. 2021 : 61–62). As Gill and Corner (2015a) have recommended, more case studies and studies using vignettes are needed to provide greater insight into the functional links between specific disorders, symptoms, and actions. Few of these studies exist (see, e.g., Erlandsson & Meloy 2018; Allely & Faccini 2019; Faccini & Allely 2019; Inderberg et al 2019), and there is a decidedly conjectural quality to the analyses available. Overall, a more holistic, dynamic, and diachronic approach is required to investigate the interaction of a series of psychological, social, and situational factors. Such an approach is recommended by “life course research” in criminology (Carlsson & Sarnecki 2015; Simi, Sporer, & Bubolz 2016; Carlsson et al 2020), but such analyses hinge on developing significant biographical data on offenders, which is labour intensive and often simply not possible.

## 1. Introduction

Mass casualty events such as those on 22 July 2011 in Norway and on 18–19 April 2020 in Nova Scotia cause an immediate impact and cast shadows for years to come, influencing the lives of relatives, friends, bystanders, response personnel, and others. While mass shootings are mostly negatively associated with casualties, fatalities, grief, and trauma, they are also important learning opportunities.

We experience mass shooting or other mass casualty events on a regular basis. Whether as a result of violent extremism, psychotic illness, or a combination of factors, mass casualties often appear as one-off events; but it is possible to look at them as a pattern of what Boin and colleagues call a creeping crisis (Boin, Ekegren, & Rhinard, 2020). We need better to understand these events, both in order to prevent or avert future mass shootings and in order to improve our preparedness and training for dealing with the events we cannot prevent, the residual risks. In this respect, it is all the more important to use the opportunities that exist to learn from these events through, e.g., after-action reports and the circulation of lessons learned.

The aim of this report is to study mass shooting incidents through the theoretical lenses of crisis, crisis management, information, situational awareness, and decision-making as a means of learning lessons that can be applied in the future. The report is based on research on the concepts of risk, crisis, situational awareness, sense-making, decision-making, societal safety, and learning, and on extensive research on mass shooting and police use of force. The report is not based on original empirical data from the events in Nova Scotia in April 2020 but will point out some similarities between those incidents and other cases such as the Utøya, Norway mass shooting in July 2011, Columbine in 1999, Virginia Tech in 2007 and Christchurch in 2019.

The report is structured as follows. Section 2 provides a discussion of key concepts, while chapter 3 describes sense-making and situational awareness. Section 4 focuses on crisis decision-making and section 5 on mobilization and response on three hierarchical agency or organizational levels. Section 6 looks at the public capacity in crisis response. Section 7 examines

Introduction

the importance of crisis communications, in particular two-way communication. Section 8 offers some thoughts on societal safety and responsibilities for managing mass shooting events. Section 9 presents some thoughts on learning and accident investigations. Finally, section 10 presents some concluding remarks and recommendations. A thorough review of relevant literature on these topics is presented throughout the report.

## 2. Key Concepts

### 2.1. Mass Casualties, Mass Murders, and Mass Shootings

A “mass casualty” event produces demand for medical care that may outstrip the capacity of local or even regional health care systems to provide conventional standards of care to the affected population (McCaw, Wood, McCaw, & McVernon, 2008), or an overwhelming event where the number of casualties vastly exceeds the local resources and capabilities in a short period of time (DeNolf & Kahwaji, 2018; Lomaglio, Ansaloni, Catena, Sartelli, & Coccolini, 2020). Such mass casualty events could be due to natural disasters, accidents, but also violent attacks such as mass murders or mass shootings. A “mass murder” may be described as four or more murders occurring during the same incident, with no distinctive time period between the murders (FBI, 2008: 8), or the killing of multiple people by one or more offenders in a short span of time, normally within a few hours, and either in the same place or in locations that are geographically near one another (Hickey, 2013). Those mass murders occurring in several locations, the bifurcated events, are events where the murderer begins killing in one place and then moves on to another location to continue murdering victims (Hickey, 2013). This was the case during the massacre at Virginia Tech in 2007 where the murderer began killing in the student residential dorm and continued the attack across campus 2 hours later (Huff-Corzine et al., 2014). Following the same line of thought as mass murder, a “mass shooting” could be defined as a multiple homicide incident in which four or more victims are murdered with firearms—not including the offender(s)—within one event, and in one or more locations relatively near one another (Krouse & Richardson, 2015: 2), or as killing four or more victims using firearms within a 24-hour period (Kim, Capellan, & Adler, 2021), whereas a “mass public shooting” is defined to mean a multiple homicide incident in which four or more victims are murdered with firearms, within one event, in at least one or more public locations, such as, a workplace, school, restaurant, house of worship, neighbourhood, or other public setting (Krouse & Richardson, 2015: 2-3).

There is an extensive body of relevant research on firearms flow and control, mass shootings, and emergency medical services (EMS) during/after mass shootings, including:

## Key Concepts

- **Firearms flow or epidemic:** (Cook, Cukier, & Krause, 2009; Cotter, 2014; Cukier & Sidel, 2006; Farquhar, 1996; Miller & Bryant, 2021; Rubenstein, Wood, Levine, & Hennekens, 2019; Shultz, Thoresen, & Galea, 2017; Tessler et al., 2017; Zimring, 1991).
- **Firearms control:** (Cukier, 1998; Every-Palmer, Cunningham, Jenkins, & Bell, 2021; Forsyth, 2011; Langmann, 2012; Mauser, 2011; McPhedran & Baker, 2011; McPhedran, Baker, & Singh, 2011; Mundt, 1990; Newbold, 1999).
- **Emergency Medical Services (EMS) in mass shooting events:** (Chovaz, Patel, March, Taylor, & Brewer, 2018; Jenkins, 1996; Pennardt & Schwartz, 2014).
- **Police use of force:** (Bye et al., 2019; Carlier, Lamberts, Van Uchelen, & Gersons, 1998; Flin, Pender, Wujec, Grant, & Stewart, 2006; Henriksen & Kruke, 2020a, 2020b; Mitchell & Flin, 2007; Oudejans, 2008; Schakel, van Fenema, & Faraj, 2016; van den Heuvel, Alison, & Power, 2014).
- **Training and simulation of operative police work:** (Bennell, Jones, & Corey, 2007; Helsen & Starkes, 1999; Henriksen & Kruke, 2021; Henriksen, Snortheimsmoen, & Kruke, 2018; Johnsen, Espevik, Saus, Sanden, & Olsen, 2016; Phelps, Strype, Le Bellu, Lahlou, & Aandal, 2018; Ready & Young, 2015; Saus et al., 2006; Sommer, Njå, & Lussand, 2015).
- **Mass shooting:** (Huff-Corzine et al., 2014; Kim, Capellan, & Adler, 2021; Lake, 2018; Lopez, Crimmins, & Haskins, 2020; MacNeil, 2014; McPhedran, Baker, & Singh, 2011; Miller & Bryant, 2021; Monteiro et al., 2014; Reeping, Jacoby, Rajan, & Branas, 2020; Shultz, Thoresen, & Galea, 2017).
- **Surviving and follow-up after mass shooting:** (Bharadwaj, Bhuller, Løken, & Wentzel, 2021; Jenkins, 1996; North, McCutcheon, Spitznagel, & Smith, 2002; North, Smith, & Spitznagel, 1994, 1997; Nurmi, 2017).
- **School shootings:** (Bondü, Scheithauer, Leuschner, & Cornell, 2013; Borum, Cornell, Modzeleski, & Jimerson, 2010; Böckler, Seeger, Sitzer, & Heitmeyer, 2012; Columbine Review Commission, 2001; Cramer & Bradley, 2009; Daniels, 2013; Daniels et al., 2010; Gasser, Creutzfeldt, Näher, Rainer, & Wickler, 2004; Lankford, 2013; Larkin, 2009; Panel, 2007; Upshaw, 2013; Wilson & Thomson, 2019).

## 2.2. Risk

Even though “risk” is a common term, and the concept of risk is central to a number of scientific fields, there is little general consensus on how to define and interpret it (Aven & Ortwin, 2010; Engen, Gould, Kruke, Olsen, & Olsen, 2021). A well cited definition of risk has been presented by Aven and Renn: “Risk refers to uncertainty about and severity of the events and consequences (or outcomes) of an activity with respect to something that humans value” (Aven & Renn, 2009: 6). Rosa has also focused on uncertainty and value: “Risk is a situation or event where something of human value (including humans themselves) has been put at stake and where the

outcome is uncertain” (Rosa, 1998: 28). Thus, uncertainty is a main component of risk (Aven, 2008).

### 2.3. Uncertainty

We cannot discuss risk or conduct risk management without considering the term “uncertainty.” Cambridge Dictionary defines “uncertainty” as “a situation in which something is not known, or something that is not known or certain.” In crisis response literature, uncertainty is frequently identified as a factor causing stress and/or leading to “non-decision-making,” which in turn may lead to a failure to prevent the escalation of the situation at hand. For example, as we will see in section 2.5, a crisis can be defined as “a serious threat to the basic structures or the fundamental values and norms of a system, which under time pressure and highly uncertain circumstances necessitates making critical decisions” (Rosenthal, Charles, & t' Hart, 1989: 10). Uncertainty occupies a central position in this understanding of crisis. In a crisis situation we need to reduce uncertainty and strive for sensitivity to operations (Weick, Sutcliffe, & Obstfeld, 1999), sense-making (Boin et al., 2016; Endsley, 2015; Weick, 1993) or situational awareness (Endsley, 1995).

In their discussions of transboundary crisis, Ansell and colleagues have operationalized uncertainty in three different forms (Ansell, Boin, & Keller, 2010):

- (1) uncertainty about the source of the problem;
- (2) uncertainty about the evolution of the problem; and
- (3) uncertainty about possible solutions to the problem.

The quality of performance by managers and frontline personnel in situations characterized by uncertainty and ambiguity may be enabled by some particular contextualized practices aiding them to discern, interpret, and make sense of important discrepancies as a situation unfolds, and then to develop a richer understanding of the situation at hand (Barton, Sutcliffe, Vogus, & DeWitt, 2015) (see sections 3 and 4 for a more detail discussions on sense-making and situational awareness). A key point is to look for discrepancies and to develop the capacity to

expect and manage the unexpected (Bechky & Okhuysen, 2011; Tierney, Lindell, & Perry, 2001; Weick & Sutcliffe, 2001).

In the specific context of mass shootings, uncertainty is often a particularly significant issue because they often develop fast and, in the initial phase following the triggering event, people strive to make sense of the situation in which they find themselves. All these characteristics point to mass shooting as a crisis.

#### 2.4. Situational Awareness and Sense-Making

Situational awareness is a key foundation for timely and relevant decision-making, particularly in a dynamic crisis. These links between context, situational awareness, decision-making, and action are illustrated in **Figure 1**.

*Figure 1: The Links between Context, Situational Awareness, Decision-Making, and Action*

Situational awareness both serves as a main input for decision-making and do also impact the underlying processes used for decision-making (Endsley, 1997). The way in which a person understands the situation in which he/she finds himself/herself influences the decision-making process to solve the situation at hand (Manktelow & Jones, 1987). Thus, key characteristics of the crisis influence the adoption of a relevant mental model and thereby a relevant problem-solving strategy (Endsley, 1997).

Situational awareness, or situation awareness, (SA) is the perception of the elements in the environment within a specific time and space, the comprehension of their meaning, and the projection of their status into the near future (Endsley, 1988). More specifically, situational

awareness is about perceiving critical factors in the environment, understanding what those factors mean, and finally, understanding what will happen in the near future (Endsley, 1988). Many contextual factors affect the ability to conduct timely and relevant decision-making when in a dynamic and complex situation, including those related to available capabilities, stress, workload, goals, mandates, and both internal and external expectations. Another important factor is the level of training and experience of each decision-maker involved in the critical situation.

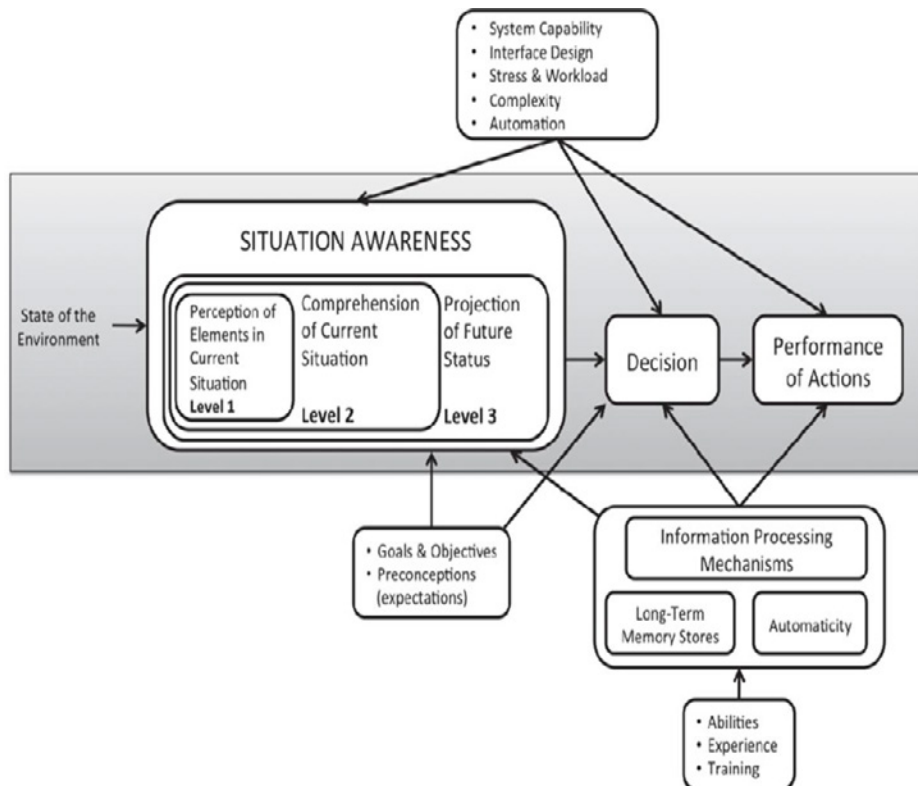

Figure 2: Situational Awareness in Dynamic Decision-Making (Endsley, 1995: 35)

Dynamic and complex novel situations often entail information overload, task complexity, and multiple tasks that may exceed the attention capacity of response personnel

(Endsley, 1995), especially those with less experience. Endsley has described how a well-developed mental model can provide (a) knowledge of the relevant “elements” of the system that can be used in directing attention and classifying information in the perception process (which Endsley refers to as “level-1 SA”), (b) a means of integrating elements to form an understanding of their meaning (which Endsley refers to as “level-2 SA”), and (c) a mechanism for projecting future states of the system based on its current state and an understanding of its dynamics (“level-3 SA”) (Endsley, 1997: 5). Experienced decision-makers can therefore use long-term memory stores and mental models (internal representations of the system they are dealing with) to circumvent limitations of learned classes of situations and environments (Endsley, 1997). These attributes, which come through training and experience, form the foundation for recognition-primed decision-making (Klein, 1989).

What is then sense-making? In Karl Weick’s research on the collapse of sense-making during the Mann Gulch disaster, sense-making is defined as “reality is an ongoing accomplishment that emerges from efforts to create order and make retrospective sense of what occurs” (Weick, 1993: 7). In their discussions of strategic crisis leadership critical tasks, Boin and colleagues also look at the pre-crisis phase in their definition of sense-making: “collecting and processing information that will help crisis managers to detect an emerging crisis and understand the significance of what is going on during a crisis (Boin et al., 2016: 15).

It is a discussion among scholars about the differences between sense-making and situational awareness (see Endsley, 2015). It is not the purpose in this report to go into this discussion. These concepts are defined, characterized and used throughout the report based on their relevance related to mass casualty events.

Because sense-making and situational awareness are the basis of timely and relevant decision-making in an acute crisis such as a mass casualty event, getting “eyes on the ground” or “eyes on the target” is often the first priority because doing so provides essential initial information. Familiarity with the scene of the crisis can also be crucial, even at this early stage. In Christchurch, for example, the arresting police officers had been attending firearms training nearby and were familiar both with the city and with the local policing (Ashford, Heron, & Kaldas, 2020). In contrast, the Norwegian police response to the Utøya attack was delayed due

to lack of local knowledge (NOU 2012:14, 2012). In both cases, the response operations took place in populated areas where citizens with local knowledge were available (Ashford, Heron, & Kaldas, 2020; NOU 2012:14, 2012; The Royal Commission of Inquiry, 2020).

### 2.5. Incidents, crises and disasters

Mass casualty events may be termed incident, crisis, disaster, emergency or catastrophe, pending who you ask, the size of the event, the impact on society, and the response required to manage the situation at hand. There are some distinct differences between these terms.

Professor Enrico Quarantelli, a well renowned researcher at the Delaware Disaster Research Center, argues for the differences between for instance everyday emergencies and disasters, and between disaster and catastrophe (Quarantelli, 2000). The purpose of this section is not to go into details related to these differences, but to state that when the term incident, crisis or disaster is used in connection to mass casualty events, the intent is not to differentiate between these terms.

Rosenthal et al. defined a crisis as “a serious threat to the basic structures or the fundamental values and norms of a social system, which – under time pressure and highly uncertain circumstances – necessitates making critical decisions” (Rosenthal, Charles, & t' Hart, 1989: 10). This definition focuses on some key crisis characteristics and challenges for crisis management, such as threat, time pressure, uncertain circumstances, and the need for critical decision-making. A well referenced definition of a disaster by the UN Office for Disaster Risk Reduction (UNDRR, formerly the UNISDR) includes some of the same characteristics: “a serious disruption of the functioning of a community or a society involving widespread human, material, or environmental losses and impacts which exceeds the ability of the affected community to cope using only its own resources” (UNISDR, 2009). This definition also focuses on a disaster as a disruption of a community, widespread losses, and the need for additional resources.

In addition to being characterized by serious disturbances, threats to the health and lives of citizens, threats to material values and reputation, the added factors of time pressure and uncertain circumstances, and the need for critical decisions, crises are events that rarely occur, and because they can have large and serious material effects, the resultant needs usually

## Key Concepts

exceed the capacities of the immediately affected communities and response organizations, which creates further significant and widespread psychological stress. A similarity between crisis and disaster is that they both deal with events that may be characterised by their un-ness: they are unexpected, undesirable, unimaginable, and often unmanageable situations (Hewitt, 1983: 11).

We can all agree that they are undesirable – these are events we want to avoid. But can we also argue that they are unexpected and unimaginable? It is fair to argue that attacks like those at Columbine (1999), Virginia Tech (2007), Utøya (2011), Quebec (2017), Christchurch (2019), and Nova Scotia (2020) took us by surprise. But should such attacks be expected? Crises are sometimes referred to as “black swans” or “grey rhinos,” and the distinction between these two terms is instructive. A black-swan event is sudden, random, and unpredictable (Taleb, 2007). A key aspect of this concept is that the event is unthought of, unimaginable beforehand. A grey rhino, on the other hand, may be threatening because it has a high impact, yet its arrival is preceded by a series of warnings and visible evidence (Wucker, 2016).

Is a mass shooting totally unthought of, unimaginable beforehand, taking us by complete surprise – a black swan? It is fair to assume that even stable and largely peaceful countries such as New Zealand, Canada, and Norway are not exempt from terrorist attacks and other mass shootings, and that they will not be so in the future. Thus, we need to treat mass shootings as grey-rhino events – events that are rare but to a degree are predictable, if only we recognize and heed the warnings.

What, then, about crisis and disasters being unmanageable? If we agree that they are unmanageable, then this leaves little room for preparedness, training, and exercises. It is fair to say that elements of the response to crisis and disasters indicate that they are manageable, even though we experience losses. That was the case in Norway 22 July 2011 and in Christchurch 15. March 2020 (NOU 2012:14, 2012; Royal Commission of Inquiry, 2020). That is also the foundation for research on naturalistic decision-making and recognition-primed decision making (Klein, 1993; Zsombok & Klein, 1997) and for training and exercises in the pre-crisis phase (e.g., Bennell, Jones, & Corey, 2007; Henriksen & Kruke, 2021; Oudejans, 2008; Saus et al., 2006; Wilkerson, Avstreich, Gruppen, Beier, & Woolliscroft, 2008). Thus, we need to train

and exercise to manage such events. The next crisis may not be as planned, and even take us by surprise. The training and exercises may, however, put us into a position to handle a variety of events, and thus also the next crisis.

### 2.5.1. Crisis Typologies

Another way to characterize crises is through typologies – that is, how they are categorized. A well-used categorization is to distinguish between a crisis based on man-made/society made and natural causations. The way we categorize the event in question will have a major impact on the reasons for the development of the crisis. Thus, typologies can be used as a tool to become more familiar with and for more in-depth learning after a crisis. Typologies can also increase our understand of how different actions in the various crisis phases influence the development of a crisis. Finally, typologies may assist us in the deduction of consolidated findings about crisis and auxiliary countermeasures (Gundel, 2005). One major typology distinguishes crises on the basis of their development and termination patterns ('t Hart & Boin, 2001), while a second typology distinguishes crises by the degree to which they are predictable and influenceable (Gundel, 2005). These processual manners of viewing crises allow for discerning between different crisis trajectories ('t Hart & Boin, 2001) and for the possibility of identifying common features and therefore potentially effective proactive or reactive measures (Gundel, 2005).

A typology based on the development and termination patterns of crises differentiates between “fast-burning” crises and “slow-burning” ones. The former develops fast and is terminated abruptly, while a slow-burning crisis has a creeping development pattern and terminates gradually. A “cathartic crisis” has a creeping development pattern but terminates abruptly. Finally, a “long-shadow crisis” develops fast but terminates gradually.

An alternative typology entails a consideration of the predictability and influence-ability of crises. Whereas predictability is about the ability to anticipate the development of a crisis, influenceability is about crisis managers ability to handle the situation and thereby reduce the consequences of the event in question and return to a normality within a reasonable timeframe (Gundel, 2005). Within this framework, “conventional” crises are easy both to predict and to

## Key Concepts

influence. Unexpected crises are difficult to predict but easy to influence. “Intractable” crises, on the other hand, are easy to predict but difficult to influence. Finally, “fundamental” crises are both difficult to predict and difficult to influence.

If we look at the first typology and define mass shooting events such as those 22 July 2011, the Bærum Mosque violence in 2019, the Nova Scotia events 18-19. April 2020 and the Christchurch events 15. March 2019, as fast-burning crises, the events develop and terminate fast. If this categorization is correct, we would have little reason to look for the possibility of adopting preventive measures in the period beforehand. We would also not look for the post crisis results of the events, the possible follow-up events by those who would be inspired by the perpetrator to inflict similar harms, or the post traumatic disorders involved people will need to deal with in the aftermath. However, if we see the event as a cathartic crisis, as an event that develops over time and is terminated relatively quickly, this will give room for learning based on the preventive activities that could have taken place beforehand (ref the barriers to the left in the bow-tie diagram – figure 5). If we define the event as a long shadow crisis, we may focus on the psychosocial aftermath of the crisis, aftermath that many may struggle with for a long period of time after the mass shooting, ref (Bharadwaj, Bhuller, Løken, & Wentzel, 2021; Jenkins, 1996; North, McCutcheon, Spitznagel, & Smith, 2002; North, Smith, & Spitznagel, 1994, 1997; Nurmi, 2017).

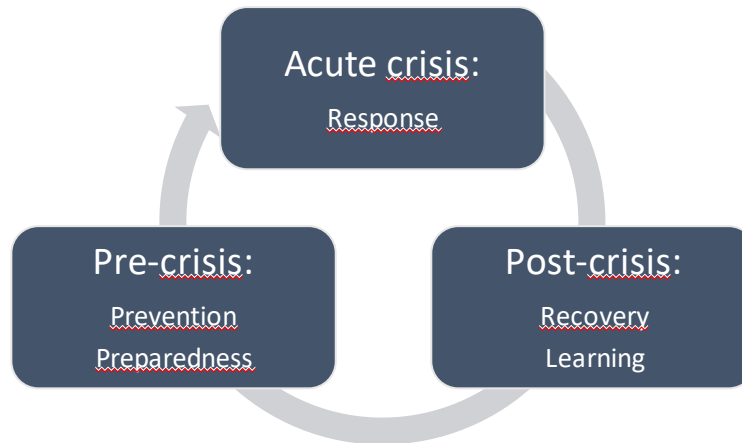

If we then look at the other typology (predictable and influenceable), a key question is whether the events at Oslo and Utøya 22 July 2011 and in Nova Scotia 18-19. April 2020 could have been predicted. If we think that we should have seen this coming, that the danger in principle is well known and often easy to locate in time, space and kind, we will define the event as a conventional crisis (easily predictable and easily influenced), or as an intractable crisis (easily predictable, but difficult to influence). However, if we think that the event was difficult to predict then we would define it as an unexpected crisis (difficult to predict, but easy to influence), or a fundamental crisis (difficult both to predict and to influence).

### 2.5.2. Crisis Phases

The study of crises and subsequent policymaking are often event driven. In other words, a high-profile or notable event will often prompt a flurry of research and policy activity. That is experienced after major terrorist attacks such as 9/11 2001, 22 July 2011, and we also see that following the Covid-19 pandemic. Media attention gives momentum to this process and has inspired many disaster studies. This was the case with accidents and disasters such as the Seveso industrial chemical accident in 1976 (Hombberger, Reggiani, Sambeth, & Wipf, 1979), the Bhopal gas leak accident in 1984 (Shrivastava, 1987), the Chernobyl nuclear accident in 1986 (Beck, 1992), the Challenger space shuttle accident in 1986 (Starbuck and Miliken, 1988; Vaughan, 1996), the Exxon Valdez oil spill in 1989 (Harrald, Marcus, & Wallace, 1990), the Clapham Junction rail crash in 1988 (Clarke, 1998), the Ebola pandemic in 2014 (Karlsen & Kruke, 2018), the Columbia space shuttle accident in 2003 (Starbuck & Farjoun, 2009), 9/11 2001 (Kendra & Wachtendorf, 2003; Rosenthal, 2003; Weick, 2005), the Christchurch mass shootings in 2019 (Klonick, 2019; The Royal Commission of Inquiry, 2020; Wilson & Thomson, 2019), and a number of US mass shootings (Columbine Review Commission, 2001; Kim et al., 2021; Larkin, 2009; Panel, 2007). In this way, there is learning potential after a crisis that may give momentum to both preventive and preparedness initiatives for the next crisis.

There are many models for crisis phases (e.g., Kruke, 2012; Mileti, Drabek, & Haas, 1975; National Governors' Association, 1979; Olson, 2000). The US Federal Emergency Management Agency (FEMA) has adopted a common model, by the National Governors' Association, that contains four phases: Mitigation, Preparedness, Response, and Recovery (National Governors' Association, 1979). Whereas mitigation includes actions to prevent or to reduce the cause, impact, and consequences of disasters, preparedness includes planning, training, and educational activities for events that cannot be mitigated, i.e., the residual risks. The response phase is the phase immediately following the triggering event when critical decision making is aimed at reducing the impact of the crisis. Finally, in the recovery phase, the main activities will be restoration to return to some sort of normalcy. The various models of crisis phases all contain the three basic phases presented in **Figure 3** below. Whereas mitigation and

preparedness form the main activities in the pre-crisis phase, the response phase is the acute crisis phase, and the recovery phase is the post-crisis phase, together with learning.

*Figure 3: The Cycle of Crisis Phases (Kruke, 2012)*

An extended crisis perspective regards crises as continuous processes (Kruke, 2012; Roux-Dufort, 2007), moving from a pre-crisis phase via an acute phase (what is normally regarded as the crisis itself) to a post-crisis phase. Prevention and preparedness form the main activities of the pre-crisis phase. The crisis response in the acute phase is aimed at reducing the consequences of the crisis, alleviating the suffering of people stricken by the crisis, and reducing the impact on lives, health and safety, the environment, property, and also reputation. In the post-crisis phase, the important activities involve recovery, rebuilding (Build Back Better), and learning, which aim to put communities and agencies into a more robust position than that prior to the crisis.

The cyclical nature of **Figure 3** may lead to an understanding that we move from a post-crisis phase and back to the pre-crisis phase, where we left off, as some sort of status quo. That is not the case. Instead, **Figure 4** shows a continuous but evolving process whereby learning from each crisis leads to more robust capacity to deal with subsequent crises and disasters.

Key Concepts

*Figure 4: Crisis Phases as a Spiral (Kruke, 2021)*

This three-phase crisis model also allows for an understanding of crisis on a continuous basis: when we are in the pre-crisis phase, waiting for the next acute crisis, then we may be more open and aware of signals that indicate that something may be wrong and that we are heading into an acute crisis (Weick, 2001; Weick & Sutcliffe, 2001; Weick, Sutcliffe, & Obstfeld, 1999).

Common to all crises is that "the next crisis has never happened before." When confronted by a crisis, we may recognize some aspects from previous crises. It is, however, problematic if we treat the next crisis as the previous ones. We also need to look for the aspects of the situation at hand that do not fit with our previous experience. What does this mean for our preparations for crisis response? We need to put ourselves into a position where we are able to manage the unexpected (Weick & Sutcliffe, 2001). Then when we do enter an acute crisis phase, response can embody a two-part process:

1. implementation of planned and trained structures from the preparedness activities in the pre-crisis phase; and

## 2. adaptation of the response to the situation at hand.

Thus, crisis management in the acute phase will be a test of the quality and relevance of our contingency planning and the planned, trained structures of the crisis response – but it will rely heavily on critical decision-making under a high degree of uncertainty (Kruke, 2012). Even with proper preparedness planning and training in the pre-crisis phase, there will always be a need for adaptation to the specifics of a particular crisis. Flexibility, improvisation, bricolage, and adaptation are therefore key words in crisis response (Kruke & Olsen, 2005; La Porte, 2007; La Porte & Consolini, 1991; Mendonça, Beroggi, & Wallace, 2001; Schakel & Wolbers, 2021; Weick, 1993). Such deviations and adaptations of our plans to the situation at hand can be crucial to handling a situation that arises. It is part of the nature of the crisis that not everything will “go smoothly.”

### 2.6. Crisis Prevention and Mitigation

It is possible to look at a crisis as a single, one-off event, as an exception from everyday life. But this understanding leaves little room for learning and improvement. In contrast, it is possible to look at a crisis as a process of incubation that starts long before the triggering event (Dekker, 2006; Groeneweg, 1992; Kruke, 2012; Roux-Dufort, 2007; Turner, 1976). This outlook leads both to optimizing prevention and preparedness strategies and to maximizing the learning potential in the pre- and post-crisis phases. In this respect, we may look for learning opportunities within past crises. Reports, evaluations, and inquiries of previous mass casualties tend to take this latter approach, focusing on both the pre-crisis phase and the acute crisis phase (Henriksen, Brenden, Hoel, Kruke & Myhrer, Forthcoming in 2022; NOU 2012:14, 2012; The Royal Commission of Inquiry, 2020).

A bow-tie diagram may assist us in understanding both the potential sources of an unwanted event, and the control measures or barriers to prevent the event from happening, and the potential mitigation or recovery measures to reduce the consequences of the unwanted event. Thus, a bow tie diagram is a graphical representation centered around an unwanted event (center). On the left side (prevention) are paths on possible causes of an event or risk. On

the right side (mitigation) are the paths indicating the consequences of the event. Barriers are drawn in the diagram, on the left side as preventive measures, and on the right side for reducing the consequences of the event in question.

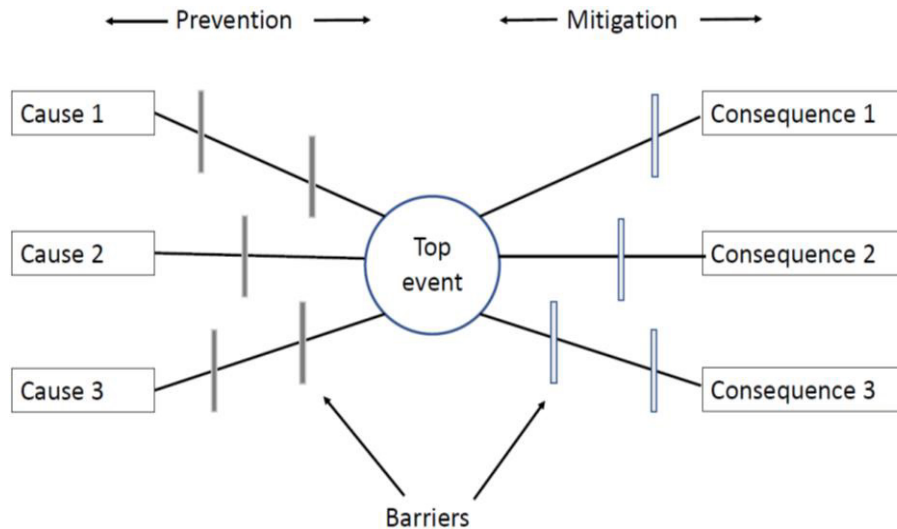

Figure 5: Generic and simplified bow-tie diagram

Typical activities to the left of the diagram (**Figure 5**) are various preventive activities, prevention of threats escalating to a top event, and in this case, a mass casualty event. These activities may be increased focus on psychiatric treatment of people in need and preventive activities in radicalized milieus. According to the 22 July Commission in Norway, there has generally been an insufficient acknowledgement of risk and learning from exercises has not been adequate (NOU 2012:14, 12). Thus, society at large must share the blame for the lack of risk awareness. However, the democratic costs related to systems intended to eliminate every risk of terrorist attack are too high – we must live with a certain level of risk (NOU 2012:14, 2012). Thus, there are dilemmas related to the quality of the barriers to prevent mass casualty

## Key Concepts

events from happening. Another example is gun control. Mass shootings also typically renew calls for passage of gun control legislation - stricter weapons laws (Krouse & Richardson, 2015). Following the 22 July attacks the Commission of Inquiry stated that Norway, a country with a large number of weapons, have inadequate systems for registration of weapons, and the weapons control regulations for ownership are not systematically enforced (NOU 2012:14, 2012). There are also interest groups advocating for a more liberal weapon control. In the US this is mostly related to self-protection. In Norway this is more related to hunting and sport. It is also worth mentioning that in the UK, following the Dunblane Primary School mass shooting in Scotland on 13 March 1996, a general ban on private ownership of small arms was put in place (UK Public General Acts, 1997).

Typical activities to the right of the bow-tie diagram will constitute the barriers that reduce the consequences of a mass casualty event. These activities may include the swift and robust mobilization and deployment of response personnel. This response is most of all the result of preparedness activities in the pre-crisis phase, such as relevant equipment, knowledge, and competence to be able to handle the situations we could not prevent, the residual risk. These activities are part of the pre-crisis phase. But the quality of these preparedness activities (to the left in the diagram) are revealed in the quality of the response, i.e., the ability to reduce the consequences of the event (the right side of the diagram). Other activities to the right of the diagram would be crisis communication in and between the response organizations, and crisis communication to the public. Members of the public are often the first to face the perpetrator, and they need information about the threat in order to implement potentially life-saving strategies.

Prevention is a main strategy to the left of the bow-tie diagram, in the pre-crisis phase. A question that often arises in the post-crisis phase is: “could this have been prevented”? Thus, prevention is often an important part of post-event reports and inquiries. For example, approximately 30% of the 22 July inquiry report deals with questions related to prevention (NOU 2012:14, 2012). In the report following the Christchurch mass shooting in New Zealand, many questions were raised about detecting potential terrorists and assessing counterterrorism efforts (The Royal Commission of Inquiry, 2020). And after the Kongsberg mass killing in October

2021, close to 50% of the report is expected to relate to possible prevention of the attack (Henriksen, Brenden, Hoel, Kruke & Myhrer, Forthcoming in 2022). However, even though it is not the intent of this discussion to state that these events could have been prevented, in the following are some examples of such discussions following mass casualty events:

- The 22 July Commission concluded that it would be too strong to conclude that there were no grounds for contending that the Norwegian Police Security Service could and should have averted the attacks on Utøya Island. However, with better ways of working and a broader focus, the Norwegian Police Security Service may have been able to become aware of the perpetrator prior to 22 July (NOU 2012:14, 2012).
- The 22 July Commission concluded that the car bombing of the Government Quarters could have been predicted, and greater measures taken to avert it (NOU 2012:14, 2012). The road leading up to the entrance were to be closed later that year.
- Post-incident evaluation suggests that warning signs prior to the Bærum Mosque shooting in 2019 could have been recognised (Evaluation Committee, 2020). In the summer of 2018, the Norwegian Police Security Service received concerns about extreme attitudes of a nationalist promoting an authoritarian state and conservative views related to family, marriage and sex. The report also stressed that this person had recently joined a shooting club (Evaluation Committee, 2020). The Evaluation Committee assesses the initial treatment of information to be in line with current routines and guidelines, and that the processing of the information was proportional to the information available. However, the Evaluation Committee also concluded with the need for more cooperation between the Norwegian Police Security Service and the Oslo Police District (Evaluation Committee, 2020). Furthermore, the committee would have liked to see an increased attention to cooperation and information exchange between public agencies and the authorities.
- In their final report and findings of the safe school initiative, Implications for the prevention of school attacks in the United States, the authors conclude that some future attacks may be preventable (Vossekuil, Fein, Reddy, Borum, & Modzeleski, 2004). Most incidents of targeted school violence were thought out and planned in advance. Also, the behaviour of

Key Concepts

the perpetrator signaled that something could happen, and signs were noticed by other students and people in their lives, making them concerned. Other research points to similar scope for potential prevention of school shooting rampages (Bondü et al., 2013; Böckler et al., 2012; Cramer & Bradley, 2009; Daniels, 2013; Daniels et al., 2010).

- The 9/11 Commission Report criticized the intelligence communities in the US for not sharing information that could have prevented the attack 9/11 2001 (Kean & Hamilton, 2004). The Commission Report advocate for a different way of organizing Government. The US Government has access to a vast amount of information. But it has a weak system for processing and using what it has. The system of “need to know” should be replaced by a system of “need to share.” In tackling information issues, America needs unity of effort (Kean & Hamilton, 2004).

### 3. Sense-Making and Situational Awareness

#### 3.1. Information and Information-Processing

Crises are, as mentioned in chapter 2, strongly related to uncertainty, especially in the initial phase. Thus, data collection and sharing of information in and between response organizations are crucial for a robust response to a situation that is dynamic, unexpected (Gundel, 2005), and fast-developing ('t Hart & Boin, 2001). There is extensive research on information, information-processing and coordination in crises and disasters, e.g., information and coordination in rapidly evolving disaster response systems (Comfort, Ko, & Zagorecki, 2004), information processing and information needs (Andreassen, Borch, Marchenko, & Sydnnes, 2019; Kruke, 2009; Perry & Nigg, 1985; Sellnow, Seeger, & Ulmer, 2002; Turner, 1978, 1994; Turner & Pidgeon, 1997), and coordination in crisis and disaster response (Comfort, 2007; Drabek, Adams, Kilijanek, & Tamminga, 1979; Drabek & McEntire, 2002; Kruke, 2010; Renå, 2021; Schakel, van Fenema, & Faraj, 2016; Simsa, Rameder, Aghamanoukjan, & Totter, 2019; Stephenson Jr., 2005).

Information overload is generally understood as receiving *too* much information. Organizational scholars define overload as a state induced when the amount of input to a system exceeds its processing capacity or when information processing capabilities and the information loads encountered are mismatched (Sutcliffe & Weick, 2009). We normally argue in the initial stages of a crisis that we do not have the required level of information to base our decisions on. But, information overload may also be a relevant challenge in crisis response. The increased communication via social media adds to that (Hiltz & Plotnick, 2013; Kaufhold, Rupp, Reuter, & Habdank, 2020). Thus, information overload may be a general challenge in crisis response (Crichton, Lauche, & Flin, 2005; Engen, Kruke, Olsen, Olsen, & Pettersen, 2016; Klein, Pliske, Crandall, & Woods, 2005; Salas, Sims, & Burke, 2005), a challenge that may result in decisions not reflecting the needs in the crisis area, and non-decision making ('t Hart, Rosenthal, & Kouzmin, 1993).

Relevant and continuous data-gathering and information-processing horizontally, including across organizational boundaries, and vertical, in each response organization, are crucial for developing relevant situational awareness. Inadequate information-sharing may

cause misunderstanding (Endsley, 2015; Kahneman, 2012) and thus lead to poor decision-making, decision-making that do not meet the requirements to handle the situation at hand. The 22 July Commission concluded that information and communications technology had not been utilized to its full potential during the acute phase of the attacks, particularly with regard to interagency coordination and interaction (NOU 2012:14, 2012). The police relied on telephone calls to notify and mobilize personnel, a system based more on coincidence than on protocols or emergency preparedness schemes. Time was lost that could have been spent working on situational analysis and management of the operations. The police operation rooms also experienced information overload, in that there was insufficient staff to receive and manage the level of information coming in (NOU 2012:14, 2012). Experience and repeated exercises have shown that such understaffing translates into vulnerability. This issue was therefore a central feature of Norwegian police reform in the years after 2011, and the staffing of police operation rooms is now much more robust.

### 3.2. Cognition, Sense-Making, Cosmology Episodes, and Variable Disjunction

Crises are, as stated in chapter 2, unwanted events characterized by a degree of uncertainty. Whereas some people experience some sort of recognition and *déjà vu* when confronted by a crisis, others experience a crisis as a cosmology episode. This two-part experience is supported by research on crisis management. The initial phase of a crisis or a disaster has been referred to as the “milling phase” (Schneider, 1995), the “sense-making phase,” and the “What the hell is going on-phase” (Boin, 't Hart, Stern, & Sundelius, 2016). It involves citizens and responders trying to register the significance of the situation, and the process forms the first part of an emergent situational awareness (Endsley, 1995). In general, cognition is strongly related to sense-making (Boin & Renaud, 2013; Klein & Moon, 2006; Weick, Sutcliffe, & Obstfeld, 2005) and collective mindfulness (Weick, Sutcliffe, & Obstfeld, 1999). In her article on crisis management in hindsight, Louise Comfort has argued that such cognition, understood as the capacity to recognize the degree of emerging risk to which a community is exposed and to act on that information, is central to emergency management performance (Comfort, 2007). Thus, recognition, information-sharing, and contextual understanding are important for timely and relevant emergency response. From an emergency medical viewpoint, incident analysis reports

following mass shootings suggest that improvements in situational awareness can reduce the number of deaths during the incidents (Monteiro et al., 2014).

'When confronted by a new situation, two different understandings or feelings may characterize how we proceed and deal with the situation. On the one hand, something may happen to cause people to feel suddenly and deeply that the universe is no longer a rational, orderly system. This has been referred to as a "cosmology episode" (Weick, 1985: 51-52). Alternatively, a situation can be perceived as capable of being made sense of. Broadly speaking, this latter sort of sense-making "focuses attention upon the idea that the reality of everyday life must be seen as an ongoing 'accomplishment,' which takes particular shape and form as individuals attempt to create order and make retrospective sense of the situations in which they find themselves. ..." (Weick, 2001: 11). In the context of crisis management, sense-making is a challenge made up of two components: detection of emerging threats and vulnerabilities; and an understanding of the unfolding crisis (Boin, 't Hart, Stern, & Sundelius, 2016: 23).

Another way of describing the degree of recognition when confronted by a crisis is presented by Karl Weick as the difference between *déjà vu* (I have experienced this before) and *vu jà dé* (I have never experienced this before) (Weick, 2001) . Experience is a main part of recognition primed decision-making that will be discussed later.

In a mass shooting scenario that develops fast, a main challenge is to understand what is going on, at an early stage, making situational awareness crucial for crisis decision-making.

## 4. Crisis Decision-Making

Management of a crisis or disaster is distinct from everyday policing operations and civil management. The level and quality of planning and decision-making normally seen in a stable society, such as rational planning processes (Banfield, 1959), often diminish in the face of a sudden crisis. Mass casualty events are undoubtedly extreme and extraordinary. Despite their relative rarity and the potentially overwhelming severity of their consequences, however, it is nevertheless possible to identify recognizable signs. The challenge is thus to make sense of the situation and to adapt the response accordingly. Proper response capacities, training and equipment may then be adequate also for managing these events. Before we go into the different decision-making models, we need to include some thoughts on training and experience.

### 4.1. Experience and Training as the Foundation for Decision-Making

An important part of pre-crisis preparation is the training of response personnel. In her book *The Unthinkable: Who Survives when Disaster Strikes – And Why*, Amanda Ripley has argued that the more prepared, the more feeling of control (Ripley, 2008). Without such preparation, it is possible that our preparedness may be based on a fantasy document (Clarke, 1999), on exceptional contributions and improvisations from response personnel, or reliant on coincidence (NOU 2012:14, 2012). For example, a lucky coincidence during the Utøya operation was that the daughter of the National Police Directorate's liaison to the Oslo Police District staff called her father when the shooting started at Utøya. He immediately handed his phone over to a representative of the Norwegian Police Delta Force, who then received first-hand information about what was going on at Utøya (Stensønes, 2017). According to the 22 July Commission, both good and bad luck will play a part in a crisis: unanticipated events and chance will to some extent influence how events play out. The phone is an example of coincidence that influenced the initial Utøya-response of the Norwegian Police Delta Force. However, planning and training can not be based on coincidence or luck. But, in accident investigation we need to consider this element. Coincidence or luck may conceal the reality of available preparedness resources.

There is much relevant research on training , including simulation training in mass casualty incidents (Wilkerson, Avstreich, Gruppen, Beier, & Woolliscroft, 2008), situational awareness training in a police shooting simulator (Saus et al., 2006), experiential learning and simulation-based training in Norwegian police education (Phelps, Strype, Le Bellu, Lahlou, & Aandal, 2018), the quality of firearms training among police officers (Henriksen & Kruke, 2021; Oudejans, 2008), decision-making training for frontline police officers (Johnsen, Espevik, Saus, Sanden, & Olsen, 2016) in potentially dangerous interventions (Helsen & Starkes, 1999), training for decision-makers in non-technical skills (Crichton, Flin, & Rattray, 2000), crisis simulation for preparatory efforts (Boin, Kofman-Bos, & Overdijk, 2004; Boin, Kofman-Bos, & Overdik, 2006), use of force training in Canadian police agencies (Bennell, Jones, & Corey, 2007), and simulator training of time-critical and dynamic situations (Aronsson, Artman, Brynielsson, Lindquist, & Ramberg, 2021).

Salas and Cannon-Bowers conducted a comprehensive review in 2001 of the training research literature reported over the previous decade. They described the progress in five areas of research, including training theory, training needs analysis, antecedent training conditions, training methods and strategies, and post-training conditions (Salas & Cannon-Bowers, 2001). Another promising study was conducted by Salas and colleagues in 2012 pointing to two issues related to training. First, training works. Second, the way in which training is designed, delivered, and implemented matters (Salas, Tannenbaum, Kraiger, & Smith-Jentsch, 2012). Similarly, proper collection of experience data, analysis of training needs, and proper design of training have been found to be crucial for effective incident response training, including mass shooting responses.

Much police training on on-going life-threatening violence is conducted indoors (NOU 2012:14, 2012), and a typical mass shooting training scenario involves an active shooter at a school. However, mass shooting events in Nova Scotia (2020), Utøya (2011), Kongsberg (2021), and Christchurch (2019) have made clear that there is a need for specific training in open terrain. A scenario is defined as “descriptions of plausible events that may occur in the future, leading to a particular set of outcomes” (Cambridge Centre for Risk Studies - in collaboration

with Lighthill Risk Network, 2020). Thus, training scenarios may give response personnel the recognition they need in a mass shooting if the training is relevant.

Training and exercises, and also operations, are opportunities to map the quality of information-processing and cooperation in and between organizations. A conclusion that frequently emerges in reports from police exercises and incidents in Norway is that there is a need to improve information dissemination and information exchange (Evaluation Committee, 2020; Norwegian Directorate for Civil Protection, 2006; NOU 2012:14, 2012). It is fair to argue that, in addition to making evident the need for an increase in information exchange, regular and relevant training exercises can improve the ability of personnel to interact with and cooperate well with others, both internally in own organization, but also with counterparts in other organisations (ref figure 7).

Training must also be seen in correlation with experience level. Recognition in a mass shooting event may be the result of either relevant experience (with a mass shooting event), relevant training and exercises in mass shooting scenarios, or both. Most police officers do not have experience with a mass shooting or with a mass shooter taking up the fight with the police. Thus, relevant training and exercises are important for police officers to gain competence about how to handle a mass shooter and thereby increase the likelihood to recognition and timely decision-making when facing a mass shooter.

The 22 July Commission concluded that Norwegian police training on “shooting in progress” situations prior to the attacks at Utøya paved the way for an effective response operation once the police arrived on the island (NOU 2012:14, 2012). However, the Commission nonetheless recommended additional training for specific types of tactical response personnel (those who are licensed to carry arms with less training in the Norwegian police force), in particular, training related to the use of firearms (NOU 2012:14, 2012).

#### 4.2. Intuitive and Analytic Decisions

There are many models for decision-making, such as the Banfield rational planning model (Banfield, 1959), but most deal with ordinary, everyday decisions. Others, such as the naturalistic decision-making (NDM) model concerns decision-making in a crisis (Kornberger,

Leixnering, & Meyer, 2019). The recognition-primed decision (RPD) model (Klein, 1993) is based on the idea that incident commanders use their own experiences to identify a crisis and thus find good and adapted responses.

Decision-making processes can broadly be described as either intuitive or analytic (Hamm, 1988; Hammond, 1986, 1988; Helsloot & Ruitenbergh, 2004; Kahneman, 2012). Edward C. Banfield, an early researcher into analytic decision-making, formulated a rational planning model with four key components (Banfield, 1959):

1. Analysis of the situation: all possible open courses of action to reach the end result.
2. End reduction and elaboration: an end is an image of a future state of affairs towards which action is oriented.
3. The design of courses of action: a developing course of action implies a description of the “key” actions to be taken or the commitments to be made.
4. The comparative evaluation of consequences: all consequences—not merely those intended by the planner—must be taken into account.

Following this rational planning model, it is theoretically possible to use a simple framework to make a decision, as illustrated in **Table 1**. Potential courses of action (alternatives A-C) are displayed at the top of the table. To the left is a list of evaluation criteria that are used to evaluate each course of action with a simple black-and-white/yes–no binary. We then choose the option that produces the cumulatively optimal outcome. In this example it will be the course of action represented by Alternative A that will be our decision because it is predicted to fulfill four of our five criteria.

*Table 1: A Rational Choice Process*

Evaluation Criteria	Alternative A	Alternative B	Alternative C
Criteria 1	X		
Criteria 2		X	X
Criteria 3	X		X
Criteria 4	X	X	X
Criteria 5	X	X	
<b>Total</b>	4	3	3

This rational choice model based on rational planning is instrumental to many everyday decision-making scenarios. This classic theory of decision-making is based on research, mainly in controlled settings. Unfortunately, the process outlined by this type of decision-making is extremely simplistic, time-consuming, and based on clear-cut factors (i.e., a finite set of alternatives, as well as criteria that can be judged on a yes/no basis). Moreover, each alternative course of action may generate a cascade of potential subsequent choices that must also be judged against the criteria before a decision can be made rationally.

This model does not meet the need for timely decisions in a dynamic and complex crisis. As can be seen by the process described above and illustrated in Table 1, analytic decision-making is based on rules of reasoning, algorithms, and formal logic. In contrast, intuitive reasoning is associative, automatic, emotional, and unconscious (Helsloot & Ruitenber, 2004). Intuitive decision-making is based on recognition of situations and experience with relevant circumstances. In the context of a fast-developing crisis characterized by a lack of preparation time, response personnel may react intuitively to make life-saving decisions (Helsloot & Ruitenber, 2004). However, intuitive decisions can also be the result of weaknesses in group dynamics, stress, and time-pressure, and they may lead to further systematic weaknesses in information-gathering, assessment processes, and subsequent decision-making. Intuitive decision-making may be problematic due to an inadequate foundation on information and/or reliance on analogies that are not relevant for the situation at hand. We may be led astray due to our gut feelings. While experience and training may address some of the weaknesses associated with intuitive decision-making, an alternative model of decision-making has attempted to account for the many complexities of dynamic crises, as well as of human and organizational interactions. This model will be examined below.

#### **4.3. Naturalistic decision-making (NDM)**

Naturalistic decision-making (NDM) is a model describing how people actually make decisions in real-life situations, under time pressure and stress (Klein, 2008; Lipshitz, Klein, Orasanu, & Salas, 2001; Zsombok & Klein, 1997). These settings differ to a large degree from the more controlled settings of rational choices. They are characterized by time pressure, high stakes, uncertainty,

dynamic contexts, multiple actors, organizational limitations, and vague and shifting goals (Klein, 1993). Successful decision-making in such scenarios builds on long and relevant experience, on not choosing between alternatives and with less procedures. One of the NDM-models is the recognition-primed decision model (Klein, 2008).

To account for the complexity of dynamic real-life situations, the recognition-primed decision-making model, illustrated in **Figure 6**, is far from simple. But it is centred around two key components: how decision-makers generate good options by using experience to build a repertoire of relevant patterns; and how decision-makers evaluate an option, through imagining how the option may play out in the given context, without comparing it to other options.

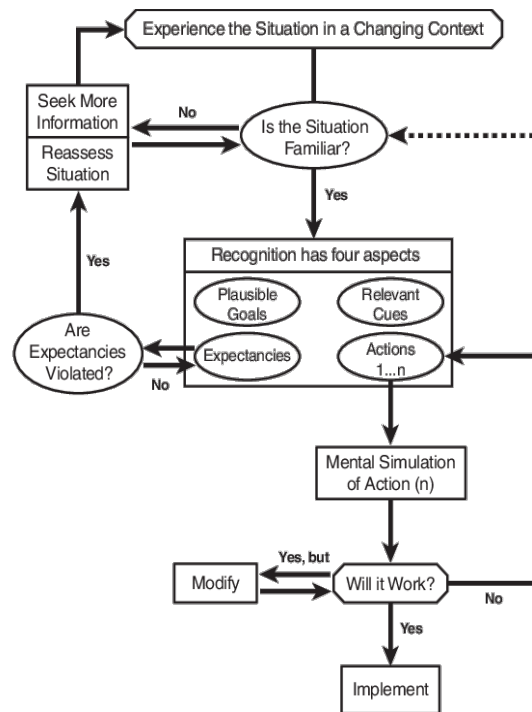

Figure 6: Recognition-Primed Decision Model (Klein, 1998: 27)

In the first part of the model, the decision-maker experiences a situation in a changing context that requires a decision. The decision-maker will consider if the situation is familiar, if

there is a pattern match from a previous experience. A pattern match, or recognition, is based on relevant cues, plausible goals, and relevant expectations. If these expectations are violated, the decision-maker may need to reassess the situation and/or seek out more information. Pattern recognition furthermore will suggest a set of actions that are likely to be successful. The next step is to evaluate the first action through mental simulation. If the decision-maker deems that Action 1 will work as is, implementation is the next and final step. Action 1 can also be modified and then re-evaluated; or the decision-maker may need to move on to Action 2 and repeat the evaluation process, possibly even returning to the pre-recognition stage, before arriving at a course of action that is judged to have a potentially successful outcome.

The key features of the recognition-primed decision model include (Klein, 1996, 1997):

1. a blend of intuition (pattern recognition) + analysis (mental simulation);
2. a usually workable first option (no random generation of options);
3. “satisficing” (Simon, 1973), that is, a workable choice in a short period of time, which is not the same as optimizing;
4. evaluation through mental simulation – not rational choice;
5. a focus on elaborating and improving options, not choosing between options;
6. a focus on situation awareness, not courses of action; and
7. a decision maker who is primed to act, not waiting to complete the analysis.

This model has been adopted in a number of sectors (see Henriksen & Kruke, 2020; Klein, 1993; Ross, Klein, Thunholm, Schmitt, & Baxter, 2004) such as the armed forces, police organizations and fire departments – organizations working in environments characterized by time pressure, high stakes (life and health, the environment, material values and reputation), vague and shifting goals, uncertainty, inadequate information, and dynamic conditions.

#### 4.4. Information and Decision-Making

When do we have enough information about a situation to make timely and relevant decisions?

This is a key issue and challenge in most dynamic crises. For example, researchers have examined how police officers make decisions about use of their firearms (e.g., (Helsen & Starkes, 1999; Henriksen & Kruke, 2020b; Mitchell & Flin, 2007; Renå, 2021, 2022; Schakel et al., 2016; van den Heuvel et al., 2014). We seldom feel that we have enough information to make decisions in situations where important values are at stake, values such as life and health. The

result may be non-decision making (’t Hart, Rosenthal, & Kouzmin, 1993) or decision avoidance (Anderson, 2003). Non-decision making can be the result of a perceived need for more information, but also of information overload. The wider research on decision avoidance also argue that humans avoid decisions because they prefer status quo (Samuelson & Zeckhauser, 1988), they prefer not to act - omission bias (Ritov & Baron, 1992), initial inaction tends to persist - inaction inertia (Tykocinski, Pittman, & Tuttle, 1995), and delay - choice deferral (Dhar, 1996). However, even though we may have many reasons for delaying decision-making, we need to make decisions to handle the situation at hand. Even though we are likely to receive more information the longer we wait, and our decisions will thus be based on a more precise understanding of the situation at hand, important values may be lost due to the delay in decision-making. The crisis itself does not wait. In a dynamic, fast-burning crisis (’t Hart & Boin, 2001), the crisis develops, and may therefore increase the threat. That means that our options or alternatives, even though we learn more about them, may be closing. Thus, we have a window of opportunity to make decisions. In the initial stages of a crisis, we may not have enough information to make precise decisions, but we may have several alternatives to choose from. At a later stage in the development of the crisis we may have more information, but the available alternatives may be decreasing. Balancing the level of information with available alternatives is a key aspect of crisis response. In their study of the Norwegian police response to the 22 July attacks, Bye and colleagues have looked at institutionalized informal practices that get established over time and may influence police operations (Bye et al., 2019). In addition, they have identified additional issues related to actor complexity, the large number of actors involved and subsequent need for coordination, and the level of uncertainty of what was going on during the response. They have concluded that marginalized strategic management resources resulted in insufficient attention towards intelligence, leading to an ineffective police effort to track and capture the perpetrator and thereby prevent further casualties (Bye et al., 2019). In other words, management and decision-making on several levels of the response hierarchy play a direct role in the success and timeliness of crisis response operations.

Mass shooting incidents often entail decision-making on the basis of what most would regard as insufficient information, so clear strategies must be adopted, and training be

implemented; but it is also important to recognize that, given the inherent nature of such crises, there will likely be bad calls and courses of action that lead to unfortunate outcomes. Future judgment will always be coloured by knowledge of the actual outcome, but in the midst of a crisis, choices and their consequences are far less clear (NOU 2012:14, 2012). First responder agencies are under increasing scrutiny for to their ability to mount timely and coordinated responses to unexpected events (Schake et al., 2016). In a mass shooting, a rational analytic approach to decision-making such as that discussed in section 4.2 above will be too slow. “Satisficing” – not optimizing – may be the best strategy for decision-making in a fast-developing scenario. In this way, planning and crisis response are two distinct disciplines (Perry & Lindell, 2003). Individuals’ actions are heavily influenced by the ways in which the road has (or has not) been paved for them to perform their duties, and it is easy to forget that imperfect systems can leave individuals in positions to make fatal mistakes (NOU 2012:14, 2012).

## 5. Mobilization and Response

The final test of the quality and relevance of a crisis response system comes when a mass casualty event unfolds. Reliable responses to terrorist events and mass shooting events require the ability for rapid assessment and adaption, flexibility in decision-making and coordination, and trust between crisis responders and agencies (Kapucu, 2012). A mass casualty response may require the mobilization and response from all levels of the response hierarchy. Standard hierarchy among professional crisis response organizations often encompasses three broad levels (Engen, Gould, Kruke, Olsen, & Olsen, 2021), as shown in **Table 2**.

*Table 2: Organizational Levels of Crisis Response*

Main Job Site	Type of Decision-making
Headquarters	Strategic
Operations rooms	Operational
Field (incident scene)	Tactical

Most people associate crisis response to action at the field level, at the scene. This association is reaffirmed by the crisis response principle of proximity – decisions should be made as close to the scene as possible. However, not *all* decisions should be made at the tactical level. In fact, many decisions are and should be made at the operational and strategic levels. Such decisions include those related to mobilization of additional resources, cooperation between multiple scenes, how to deal with the media, crisis communication strategies, etc.

An important aim of decisions made at the higher levels of the response hierarchy is to provide the means for swift and efficient response at the tactical level. Thus, a key question is the degree to which the operational and strategic levels possess the required understanding of the situation at hand to provide the relevant support needed at field level. Sensemaking at the different hierarchical levels may differ (Boin & Renaud, 2013; Barry Turner, 1976), calling for increased horizontal and vertical interaction in and between the response organizations.

### 5.1. Coordination: intra- and interorganizational coordination

Coordination, understood as management of dependencies (Malone & Crowston, 1994) or as the adjustment of actions and decisions among interdependent actors to achieve specified goals (Renå, 2021), is a key issue in large-scale emergency operations. This is true internally, in the various response agencies, but also cross-organisationally, between interdependent agencies. In a dynamic crisis, data collection, data dissemination, and even decision-making must take place both within and between response organisations. Some issues emerge as particularly important in crisis response, issues like intra- and inter-organisational information exchange, decision-making processes, and coordination. For example, field officers at tactical level need to interact with colleagues in their own response organization, both horizontally at field level and vertically up through their own organization; and they must also interact with colleagues in other organisations. These horizontal and vertical interaction patterns are represented by the ovals in **Figure 7** below.

*Figure 7: Horizontal and Vertical Interaction Patterns*

Whereas the vertical interaction patterns in the figure are the intra-organizational information dissemination and decision-making structures within each response organization,

the horizontal interaction patterns are the cross-organizational information dissemination and coordination structures at each level of response (Kruke & Olsen, 2011). These patterns make clear the need for systems and routines that are developed deliberately for efficient, good, and rapid situational reporting in and between all levels of crisis management. See section 4.1 for a discussion of the need to improve information dissemination and information exchange (Evaluation Committee, 2020; Norwegian Directorate for Civil Protection, 2006; NOU 2012:14, 2012). Finally, localization of decision-making authority needs to fluctuate pending the dynamics of the situation in the crisis area ('t Hart, Rosenthal, & Kouzmin, 1993; Bain, 1999; Kruke & Olsen, 2011; Weick, Sutcliffe, & Obstfeld, 1999) and the quality of vertical information-exchange between the field level and the operational and strategic levels (Kruke & Olsen, 2011).

Intra- and interorganizational barriers to information-exchange in and between organisations may hamper both the development of situational awareness and relevant decision-making. Barry Turner argues that inadequate vertical and horizontal information-processing may cause variable disjunction, “a complex situation in which a number of parties handling a problem are unable to obtain precisely the same information about the problem so that different interpretations of the problem exist” (Turner, 1978: 50). He furthermore argues that it is common for disasters to happen “when a large complex problem, the limits of which were difficult to specify, was being dealt with by a number of groups and individuals usually operating in different organizations (Turner, 1976: 384). Thus, we need both more quality vertical intra-organizational interaction between field officers at the tactical level and decision-makers at operational and strategic levels and increased inter-organizational information-exchange and coordination to secure a timely and relevant response (Kruke & Olsen, 2011).

A mass casualty event, understood as an overwhelming event where the number of casualties vastly exceeds the local resources and capabilities (DeNolf & Kahwaji, 2018; Lomaglio, Ansaloni, Catena, Sartelli, & Coccolini, 2020), is per definition an event calling for a network response by a number of actors, at several levels of the response hierarchy. Thus, in response to a mass casualty event, coordination is required between many relevant entities, including blue-light agencies but also other actors such as voluntary groups, media, the public, etc.

## 5.2. Zones in Mass Casualty Events

Cooperation and information exchange are crucial for reliable response operations in mass casualty events. In a mass shooting, this cooperation is instrumental to attend to the security of personnel, and in particular personnel from the fire department and ambulance services, but also for the public. Thus, the police incident commander (in Norway) divide the scene and surroundings of a mass shooting event into different zones based on the degree of threat or hazard within the area (Chovaz, Patel, March, Taylor, & Brewer, 2018; Pennardt & Schwartz, 2014; PLIVO-procedure, 2015). These zones (Hot or Red Zone; Warm or yellow Zone; Cold or Green Zone) are specified in many guidelines, for instance in the US National Incident Management System (NIMS) and in the Norwegian procedure for ongoing life-threatening violence (PLIVO-procedure, 2015).

These zones are part of a common language understood by blue-light agencies and particularly adopted during tactical operations in active-shooter/mass shooting events with multi-organizational responses.

Typically, these zones are defined by a police incident commander, who specifies the demarcation between zones and positioning of first responders:

- **Hot Zone or Red Zone:** This is the area with a direct and immediate threat where ambulance services and firefighters should not have access. Citizens finding themselves in this zone should evacuate, if possible, or hide.
- **Warm Zone or Yellow Zone:** This is the area with a potential threat but no direct or immediate threat.
- **Cold Zone or Green Zone:** This is the area with no significant threat reasonably anticipated. This is the staging area for firefighters, emergency medical services (EMS) and other relevant unarmed rescue capacities.

An alternative strategy involving the Rescue Task Force (RTF) is a strategy whereby a second wave of police officers' escorts civilian emergency medical services into the warm zone (Chovaz, Patel, March, Taylor, & Brewer, 2018), making it possible to assist people in need in the warm zone before the threat is neutralized in the hot zone. Nevertheless, in a dynamic situation (where, for example, a perpetrator is highly mobile) or in particularly challenging settings (e.g., treacherous terrain, darkness, a dense crowd of civilians), it is often difficult to assess the threat level, and there will therefore be a degree of uncertainty regarding the reliability of these defined zones.

Training for situations of ongoing life-threatening violence is only a small part of general police training in Norway. But there is a formal coordination procedure for such situations (PLIVO-procedure, 2015), focusing on cooperation between the police, ambulance services, and the fire department. All of these blue-light agencies have roles to play in an ongoing life-threatening violence situation such as a mass shooter event. These zones of demarcation are therefore crucial for coordinating the response and ensuring the safety and effectiveness of personnel, especially unarmed medical and rescue workers. Another important aspect of implementing these zones is to move citizens out of harm's way.

### 5.3. First responder Responsibilities in a mass shooting event

The police are the main actor mandated and trained to use force to stop a perpetrator. The response to mass shooting has historically involved a segmented operation—first focused on police officers' goals of stopping the shooting, followed by the remainder of the incident response and recovery (Jacobs et al., 2013). The responsibilities of the first police officers approaching the scene of a mass shooting has however not always been clear. The police response to the 1999 mass shooting at the Columbine High School in Jefferson County, Colorado in the USA, is a good example. Two students killed 13 people and wounded 24 people in a 45-minute mass shooting. The first police patrol arriving at Columbine High School during the mass shooting decided to secure the area while waiting for the special trained police task force – the special weapons and tactics team (SWAT-team). This was according to their training standards and available equipment. This decision to wait was heavily criticized afterwards and led to

## Mobilization and Response

initiatives to strengthen the first patrol's ability to launch immediate, tactical decisions to stop ongoing violence and save lives (Columbine Review Commission. (2001). In Norway, an active shooter scenario is termed ongoing life-threatening violence (Pågående Livstruende Vold (PLIVO)). A national standard procedure for handling a situation of ongoing life-threatening violence (PLIVO-procedure), that came into effect in 2015, calls for close co-operation between the emergency services during ongoing life-threatening violence (PLIVO-procedure, 2015). According to the PLIVO-procedure, the police will go directly towards the perpetrator and neutralize him/her. The immediate area around the perpetrator is the “hot zone.” Behind the police hunting down the perpetrator, a “warm zone” will be cleared by the police for paramedics to assist people in need and for paramedics and firefighters to transport wounded to the “cold zone.”

However, the police might not be the first professional responder on-scene. After the 22 July attack, the Norwegian police were criticized for being too slow in their response (NOU 2012:14, 2012). In the Utøya operation in particular, weak communication systems led response teams to miss each other and caused misunderstanding about the location of the mustering point. That said, even though the two attacks (in Oslo and at Utøya) took place consecutively and therefore created confusion about what was going on (Stensønes, 2017), mobilization of police resources to handle the bomb explosion in the government quarters had a positive effect on the police deployment of response capacities for Utøya, a deployment that happened more quickly and with a larger operational force than what is normally available on a Friday afternoon. Also, the police responses during the Al-Noor Islamic Centre mosque attack in Norway 10 August 2019 (Evaluation Committee, 2020) and the Valdres bus express attack November 4. 2013 (The Norwegian Directorate for Civil Protection, 2014) was delayed. In rural areas, it is possible that the paramedics and the firefighters are the first responders to arrive on scene. In such cases, the PLIVO-procedure calls for the paramedics and firefighters to neutralize the perpetrator. That was the case during the Valdres bus express mass casualty incident in 2013, when police officers were delayed and firefighters neutralized the perpetrator (The Norwegian Directorate for Civil Protection, 2014). This aspect of the PLIVO procedure is particularly relevant in cases in which a perpetrator does not have firearms, and paramedics and

fire fighters are able to use whatever equipment they have to their disposal to neutralize the perpetrator. However, even though first responders from the fire department often are available on short notice, and may comprise the first response on scene, especially in rural areas, they are generally not trained and equipped to deal directly with active shooters. Nonetheless, they are often recruited locally and thus often possess significant local knowledge of the community and geography. That information can be beneficial to an effective response. The same can be said about ambulance personnel, and the public.

## 6. Public Roles in Responding to Mass Casualty Events

Most people would expect that crisis response is a task for professionals, namely blue-light agencies or first responders. As the term indicates, first responders are specially trained to be among the first to arrive at the scene of an emergency. First responders are typically police officers, paramedics, emergency medical technicians (EMTs), and firefighters. However, first responders may not actually be the first at the scene of an event, especially one where there are many casualties or where the incident is ongoing, and furthermore, once they arrive, it is often not straightforward who is who in these settings (Mudalige, Carley, & Mackway-Jones, 2006). Many actors may be present (Reeping, Jacoby, Rajan, & Branas, 2020), including victims and bystanders (Callaway, 2018; Evaluation Committee, 2020; Kruke, 2012; NOU 2012:14, 2012). What is important to notice is that, even with a robust response from the professional responders, local capacities are key resources in a dynamic crisis ('t Hart, Rosenthal, & Kouzmin, 1993; Boin, 't Hart, Stern, & Sundelius, 2005; Dynes, 1993; Helsloot & Ruitenbergh, 2004; IFRC, 1994; Kruke, 2015, 2016; Kruke & Olsen, 2011; Schneider, 1995). In fast developing crisis, the capacities of the public may be crucial for a reliable response. Thus, this is important to consider, plan for and exercise among the professional responders.

Members of the public are often the first to be confronted by a perpetrator of mass violence. They are therefore often more or less on their own in the initial minutes of a mass shooting. They need some sort of a contingency plan on how to behave in mass shooting events. There are some strategies for public response during such an event. They mainly focus on three basic strategies for how to deal with the event (Reeping, Jacoby, Rajan, & Branas, 2020):

- RUN:** If possible, try to run away from the shooter.
- HIDE:** If escape is not possible, try to hide. Block any doors, avoid and/or blind any windows, and silence any cellular phones.
- FIGHT:** If running and hiding are not possible, and your life is in danger, the last resort is to fight back.

These strategies are part of the contingency planning in Norwegian kindergartens and schools (Norwegian Directorate for Education and Training, 2019). In addition to these strategies, the

police need to be alerted as soon as possible to mobilize and deploy a robust police response. The public calling in may also receive valuable advice from the police to take the necessary decisions to deal with the situation in which they find themselves.

Even though most members of the public are not trained and equipped to deal with an active shooter, they might have some knowledge, skills, and maybe also equipment, that is valuable for the eventual official crisis response. In some cases, members of the public have spontaneously and effectively self-organized in the face of mass casualty events (Comfort et al., 1999; Cottrell, 2010; Dynes, 1993; Kruke, 2015, 2016, 2021; Simsa et al., 2019). That was the case 22 July in Norway, both public assistance after the explosion in Oslo, and youths at Utøya assisting each other. There are also examples of forming of emergent groups (Stallings & Quarantelli, 1985; Sebastian & Bui, 2009; Tierney et al., 2001), exemplified by the public spontaneously forming groups to do search and rescue following events like Hurricane Katrina in 2005 (Sebastian & Bui, 2009) and avalanche search and rescue (Kruke, 2016). A high degree of voluntarism can also be seen in post-crisis communities, increasing the resilience of the overall response (Kendra & Wachtendorf, 2003; Upshaw, 2013).

### 6.1. Myths about Citizen Response

Can we trust the citizens and their capacities in a critical situation? There are common myths about how populations behave in crises (Clarke, 2002; Dynes, 1974; Helsloot & Ruitenbergh, 2004; Kruke, 2015, 2016; McPhail, 1991; Quarantelli, 1953, 1954, 1999; Tierney, 2003; Tierney, Benc, & Kuligowski, 2006). These myths are largely about the public panicking and being helpless in crises. Panic has been described as a strong and uncontrolled fear and loss of judgment that may lead to unwise, irrational, or reckless action (Clarke, 2002), as acute fear resulting in uncontrolled escape (Quarantelli, 1953), as mass demoralization and social breakdown (Porfiriev, 1998; Tierney, Benc, & Kuligowski, 2006), and as social disorder (Quarantelli, 1998b). While there are examples of helplessness and panic, many people assist themselves and others in need during crises, despite their own fear. And there is evidence that people seldom panic in disaster situations (Auf der Heide, 2004; Clarke, 2002; Helsloot &

Ruitenbergh, 2004; Johnson, Feinberg, & Johnston, 1994; Kruke, 2015, 2016; Quarantelli, 1953, 1954, 1999; Tierney, Bevc, & Kuligowski, 2006).

Moreover, it is possible to prepare for and even to a degree avoid panic, as indicated by the US Red Cross in an article on disaster myths, media frames, and their consequences after Hurricane Katrina in New Orleans in 2005: “I can’t stop a [tornado, flood, fire, hurricane, terrorist attack, etc.] but I can stop panic” (Tierney, Bevc, & Kuligowski, 2006). The myth that people will be helpless in critical situations can also be challenged. Research shows that communities quickly commence rescue operations and lifesaving first aid in acute crises (Dynes, 1993; Helsloot & Ruitenbergh, 2004; Kruke, 2015, 2016, 2021; Tierney, Bevc, & Kuligowski, 2006). Passivity among the population rarely occurs. Thus, even though there are examples of panic and helpless behaviour, there are also many examples of the public providing assistance. The challenge for the professional responders is to realize that they might have relevant capacities in the crisis area.

## 6.2. Crisis Response as a Shift System

Responses to sudden and unexpected events, including mass casualties, follow a pattern of a “shift system,” meaning that as the incident evolves, different groups of actors will arrive to the scene and become involved in the crisis response. This is supported by many empirical examples from accidents, crises, disasters, and catastrophes. **Table 3** shows that those civilians who are physically proximate to the event and directly affected are the first to respond, they form “the first shift”, and these civilians often engage immediately in life-preserving activities, including saving themselves and protecting others. They are also the ones who call the emergency numbers to inform the professional response organizations, and they can convey relevant information.

*Table 3: Acute Phase Crisis Response as a Shift System*

Actors	Phase	Activities and Responsibilities
Those directly affected	The “golden hour”	Own life saving and assistance to others in need
Passers-by and those randomly present	The “golden hour” +	Ad-hoc assistance to the directly affected
Professional responders (blue-light agencies)	Acute phase (30 min +)	Take command and management upon arrival on the accident scene
Volunteers (organised)	Acute phase (several hours +)	Defined by themselves and agreed upon with the professionals

The term “golden hour” is borrowed from medicine. In the crisis response “the golden hour” is the period up till seriously injured people receive professional medical attention (Helsloot & Ruitenberg, 2004; Kruke, 2012). In this period, a huge burden is upon the shoulders of those people who are present or passing nearby when disaster strikes. Since professional members of blue-light agencies are often not available during or in the immediate aftermath of a crisis, those persons who are present will form the only available initial response, including for acute life-saving actions (Helsloot & Ruitenberg, 2004).

As seen in **Table 3**, professional responders (police officers, firefighters, ambulance personnel, etc.) form the third “shift” of the acute response, taking command of the activities upon arrival on the accident scene. While the professional responders’ mobilization and deployment time within **Table 3** is 30+ minutes, in actuality, it will of course vary depending on a variety of factors, including the distance from headquarters to the scene.

Finally, **Table 3** accounts for volunteers from non-governmental organizations (NGOs), who often become involved in large-scale search and rescue operations, such as the Red Cross and Red Crescent. This fourth shift is not available on the scene of sudden and fast-burning accidents (Gundel, 2005; 't Hart & Boin, 2001) but may assist with recovery in the post-crisis phase of such an event.

### 6.3. Stress

Traumatic stress has been defined as “the emotional, cognitive, behavioral, physiological experience of individuals who are exposed to or who witness events that overwhelm their coping and problem-solving abilities” (Lerner & Shelton, 2001). Stress is more generally defined as: a) external influences (stress stimuli / stressor); b) a physical or emotional reaction to external influences (stress experience); or c) a response to the interaction between the external influences and the reactions to them. Thus, stress may be a mental and/or a physiological condition characterized by a subjective experience of being under pressure to such an extent that it is experienced as unpleasant. The body may react to this pressure with physical, mental, and emotional responses – the body releases hormones and chemicals to prepare the body for physical action. This can be interpreted as a person feeling “under attack” and switching to “fight or flight” mode. Stress can lead to impaired attention and an inability to concentrate. A typical stress reaction is a diminished capacity to perform tasks beyond the most basic routines. Integrated problem-solving becomes complicated in such situations. Another well-known phenomenon caused by stress increases is channeled attention, or tunnel vision. Stress can also reduce the ability to communicate as one is used to under less stressful circumstances.

All of these consequences of stress inevitably apply as well to police officers and other first responders (Brown & Campbell, 1994). In particular, stress can play a large role in situational awareness (Endsley, 1995; Flin et al., 2006) and decision-making (Flin, Salas, Strub, & Martin, 1997; Klein, 1996). Early psychologists Robert Yerkes and John Dillingham Dodson developed a model of the relationship between a person’s physiological and / or mental stress and their ability to perform tasks (Yerkes & Dodson, 1908). As shown in **Figure 8**, performance increases as stress increases, but only to a point, after which performance declines as stress becomes too high. However, it is fair to argue that experiencing a mass casualty event fall past the optimal point of stress for many people, especially the public, but also many professional responders.

Figure 8: The Relationship between Pressure and Performance (Yerkes & Dodson, 1908)

There is extensive research on stress reactions following mass shootings, in particular, on the subjects of surviving a mass shooting (Bharadwaj et al., 2021), follow-up of mass shooting survivors (North et al., 2002, North et al., 1997), post-traumatic stress disorder in survivors of a mass shooting (North et al., 1994), PTSD in police officers (Carlier et al., 1998), and distress and recovery in emergency responders after mass shooting incidents (Jenkins, 1996).

Paton and Flin (1999) have conducted research into disaster stress from an emergency management perspective and concluded that there are some specific disaster stressors for emergency managers. Personal factors, such as physical and mental condition, training level, age, and active versus passive personalities affect stress. External factors such as lack of or incomplete information may increase the stress level in a crisis. Operational systems that are intended to support crisis managers have a positive effect on stress. The opposite is the case if the systems do not function properly or not at all (Paton & Flin, 1999). Training in the use of the systems can give a feeling of recognition and of mastery and thereby help reduce stress.

Team composition and cooperation (or lack of cooperation) in and between teams can affect the level of stress, especially in situations of interdependence between actors and organizations (Paton & Flin, 1999). Another stress factor is the quality of communication – information exchange, which affects the understanding of the situation and thereby the quality of critical decision-making. Inadequate information processing and interpretation of information can cause adverse events (Turner, 1976).

#### 6.4. Relevance to Mass Casualty Events

The events in Norway on 22 July 2011 showed with the utmost clarity how individual actions can make a huge difference during a crisis (NOU 2012:14, 2012). Members of the public may be a valuable resource, and in rapidly evolving and surprising situations, often those who save you will be the ones standing right next to you (Kruke, 2012). In the case of a mass shooting, however, most civilians will not possess the knowledge or have the resources necessary to successfully confront the shooter. A recent study of mass shootings in the United States (Reeping et al., 2020) has identified a widespread need for bystander training and public triage training. Utilization of local contextual knowledge, the spontaneous self-organization we experience in crisis areas (Comfort, 1990; Comfort et al., 1999; Dynes, 1993; Simsa et al., 2019), and the emerging resource perspective of converting disaster victims into potential helping resources (Quarantelli, 1998a), are crucial for especially the initial response.

Even during a mass shooting when they have little to no training, members of the public sometimes play a significant role. They are usually the ones to call the police, and they may possess local knowledge that will assist the police response. When a gunman opened fire at the Al-Noor Islamic Centre in Norway on 10 August 2019, police officers were delayed due to communication problems and because their navigation app had not been updated with the latest road maintenance closures in the area (Evaluation Committee, 2020). As a result, it was a civilian response that neutralized the perpetrator, who was overpowered by three members of the public and then turned over to police after their eventual arrival (Evaluation Committee, 2020). Likewise, during the Utøya attacks on 22 July 2011, random passers-by, tourists, and local

residents were absolutely crucial to one of the most extensive rescue operations ever staged in Norway (NOU 2012:14, 2012). A few examples of crucial life-saving efforts by volunteers during the mass shooting on Utøya 22 July:

- A number of the youths on Utøya received physical injuries such as fractures and cuts in their attempts to save themselves and others (NOU 2012:14, 2012). They saw their friends being shot right in front of their eyes, some were shot at, some were wounded themselves, they had to run for their lives and hide, or swim to the mainland with bullets whizzing around their ears (NOU 2012:14, 2012).
- A girl was shot in the arm when she ran away from the perpetrator (Hanssen, 2012). Together with several others, she ended up in the fjord, swimming for safety. She felt in good shape and offered assistance to other youths swimming together with her. They were then rescued by volunteers in a boat coming to their aid.
- A student was approached by the perpetrator shouting stop and that he was a police officer (Hanssen, 2012). The student was then shot in the back but managed to hide. He was later found by two real police officers. They gave him some first aid and carried him to a tent where a 16-year-old girl was asked to take care of him. This girl was then responsible for three wounded youths, one shot in the head, a boy shot in the leg, and the student shot in the back.
- After witnessing her boyfriend shot and killed, a girl ran for safety and hide inside a building together with several other youths. Inside their hideout, they could hear several shots, and they realized that youths around them were killed. After the police arrived, she assisted the seriously injured. There was a lot of care - lots of people who just wanted to help, she said (Skjervold, Torgersen, & Melgård, 2012).
- Volunteers from Utvika Camping and other nearby places rescued young people swimming for their lives (NOU 2012:14, 2012). At the risk of their own lives, they used boats to rescue youths in the water, they rescued youths on the island while the perpetrator still was killing people, and they rescued people on the beach on the mainland just across the fjord from Utøya. This beach was in the initial phase of the

Public Roles in Responding to Mass Casualty Events

mass casualty operation considered a dangerous zone by the police (i.e. in the direct line of fire from the island). Thus, it took some time before professional responders were given access to the beach. In the meantime, volunteers formed the main part of the rescue operation.

The examples above are all about the positive contributions of volunteers in the midst of a mass shooting. Without the efforts of volunteers on that day, more lives would have been lost, and the scope of the devastation would have been even greater. Many of these volunteers acted with impressive, altruistic effort, putting their own lives in danger. Many set aside their own fears in order to save both friends and strangers; and others engaged in dangerous rescue work – both at the Government Complex and on Utøya Island (NOU 2012:14, 2012). It is of course possible that there were also some well-intentioned efforts by members of the public that interfered with the response. However, the reports after 22 July do not mention such efforts.

## 7. Crisis Communication

Crisis communication is broadly defined as the collection, processing, and dissemination of information required to address a crisis situation (Coombs & Holladay, 2010). It can also encompass dialogue between the authorities and the public, with the aim of minimizing the consequences or damage. Thus, crisis communication is about giving the response organizations and the population in the crisis area the required information to make informed decisions about how to handle the situation at hand.

There is much research on crisis communication, e.g., on the use of Twitter during floods (Bruns, Burgess, Crawford, & Shaw, 2012); on conceptualization of crisis communication and handbooks (Coombs & Holladay, 2010; Coombs, 2010; Heath & O'Hair, 2010a; Heath & O'Hair, 2010b; Seeger, 2002; Sellnow & Seeger, 2013; Sellnow et al., 2002); on crisis communication and terrorism, including the Norway attacks on 22 July 2011 (Falkheimer, 2014; Frey, 2018a, 2018b); crisis communication and social media (Filkková, Hafstad, & Jensen, 2016; Frey, 2018a, 2018b; Hallahan, 2010; Wendling, Radisch, & Jacobzone, 2013); the effectiveness of crisis communication (Millar & Health, 2004; Ulmer, Sellnow, & Seeger, 2011); and struggles with internal crisis communication (Heide & Simonsson, 2015).

While the scope of this report does not include a detailed examination of communications during mass casualties, it is important to note that in the context of civilian involvement in crisis response, communications is a two-way process. The authorities need to convey important information to the population as well as to the response teams at the tactical level; but it is also important to recognize that the authorities sometimes rely on important information from the public. A sophisticated and robust communications system is therefore essential to crisis management. Such a system needs to encompass the transmission of important information between personnel and response levels, across organizational boundaries, and to/from the public.

The indispensable role of communications was evident during the 22 July attacks in Norway. Although the police posted messages via Twitter (NOU 2012:14, 2012; Renå, 2021, 2022), a crowd-feeding communication strategy, they did not possess the required personnel

and data capacity to conduct effective crowd-sourcing (Harrison & Johnson, 2016) on social media. i.e., they did not scan social media for relevant information on what was going on at Utøya. Social media had already become a major real-time source of information about crises around the world. During the Indian Ocean tsunami 26. December 2004 social media was used on a wide scale to inform others while it was ongoing (Hallahan, 2010). Many of the youths at Utøya used social media to communicate with friends and families and to convey what they perceived to be important information to the authorities (Morsut et al., 2021). Frey has studied the use of social media during and after the Utøya terror attack (Frey, 2018a, 2018b). Kaufmann (2015) studied Norwegian citizens use of social media during the terrorist attacks (both in Oslo and Utøya). However, the police did not get access to this flow of information, nor were they able to communicate on the platforms used by the youths on Utøya to inform the youths on how to cope with the situation.

Communications between citizens calling the police emergency number and the police operation rooms may also prove difficult in the context of acute situations with lives at stake. During the Bærum Mosque shooting, for example, a civilian who called the police experienced language problems, he did not speak fluent Norwegian, in his attempt to convey his message to the police operator at the Police Operations Room (Evaluation Committee, 2020). During the mass shooting at Utøya, many young people on the island, as well as many of their friends and family members, tried unsuccessfully to call the police emergency number but received only busy signals on their phones. The few youths from the island that managed to get through conveyed a rather fragmented picture of what was taking place on the island (NOU 2012:14, 2012). Thus, it was difficult for the operators at the Police Operations Room to visualize the situation on the island.

In examining the police communications during the 22 July attacks, the Commission found that police patrols used informal language and failed to follow official crisis communication protocols (NOU 2012:14, 2012). Even though maintaining a high standard of accurate, efficient, and professional communications is a challenge during a dynamic crisis response with high levels of stress, it is nevertheless important to make sure that valuable information is communicated and received. An important part of training is therefore to

practice maintaining good, clear, and precise radio communications. Another point by the Commission was that individual patrols must be given access to technology for written and visual information-sharing and receive training in systems that enable them to do their jobs better, act in a concerted manner, and exchange information throughout all levels within the police (NOU 2012:14, 2012). Many of these lessons have since been integrated into national police reform, a new police communication system and more robust staffing of police operation rooms.

## 8. Societal Safety and Mass Casualty Events

Mass shootings and other mass casualty events are extraordinary and call for extraordinary management and responses. Most societies typically cannot manage such events with only ordinary procedures and ordinary resources. Such events require joint crisis responses by a network of actors, with strong interdependence. Furthermore, public trust, which tends to have been built up over time through long-term and robust societal functions, are put to an extreme test by a mass casualty event. Such trust is vital for successful crisis response.

“Societal safety” is defined in a Norwegian Parliamentary White Paper as “society’s ability to maintain critical social functions, to protect the life and health of the citizens, and to meet citizens’ basic requirements in a variety of stress situations” (White Paper no. 17 p.4 (2001-2002), 2002). Societal safety thus centres around a few key concepts and fundamental issues (Olsen, Kruke, & Hovden, 2007: 72):

- **Extraordinary stresses and losses:** Events, crises or emergencies that require a response beyond routine capacities and operations.
- **Complexity and mutual dependence:** Occurrences or the prevention of occurrences in technological and social systems with a high degree of interdependency.
- **Trust in vital social functions:** Occurrences or the prevention of occurrences that undermine confidence in the ability of social institutions to maintain individual or collective safety.

Each of these will be looked at more closely below with reference to mass casualty events.

### 8.1. Extraordinary Stresses and Losses

The events and losses in Norway on July 22 were extraordinary and required extraordinary handling. The scale of the attacks, the number of people calling the police emergency numbers, the tactical mobilization, and the operation room management of the entire responses required much more staff than what was initially available and made evident the vulnerabilities of police operating rooms in the face of sudden, massive operations. Thus, it is fair to ask one of the basic questions on the level of emergency preparedness: Should we prepare to deal with such "worst case" scenarios, or should we go for a more routine scenario manning? In retrospect, it is easy to criticize the people on duty, as well as the emergency preparedness. Mass casualties like

those suffered on 22 July 2011 show us that preparedness for such extraordinary events is an important topic.

### 8.2. Complexity and Interdependence

Mass casualty events such as the 22 July attacks are complex and require responses from a network of different interdependent actors, including police, ambulance services, fire brigades, civil protection units, military units, voluntary humanitarian organizations, local communities, etc. The events showed us that successful management in one sector or organization depends on successful management in other sectors and organizations.

### 8.3. Trust in Vital Social Functions

Fundamental societal institutions and infrastructures in Norway generally enjoy a high level of trust by the public (NOU 2012:14, 2012; Olsen, Kruke, & Hovden, 2007). When events like those on 22 July occur, the population generally expects them to be managed in a robust way. However, these expectations were not fully met during the responses to the 22 July 2011 attacks. Public confidence in the country's preparedness for large-scale crises was put to the test (Kruke, 2012; NOU 2012:14, 2012; Wollebæk, Enjolras, Steen-Johnsen, & Ødegård, 2012), in particular on issues like:

- The securing of the Government Quarter and the Prime Minister's Office before 22 July.
- Parts of the police responses to the mass shooting at Utøya.
- The police and the health service's handling of the rescue operation at Utvika Camping (on the land side).
- Mobile phone network capacity problems (Frey, 2018; Ling et al., 2018; Nilsen, Thoresen, Wentzel-Larsen, & Dyb, 2019).
- Internal police crisis communication during 22 July (DNK The Directorate for Emergency Communication, 2011).
- Public crisis communication directed towards the youths at Utøya during the mass shooting (Filuková, Hafstad, & Jensen, 2016; Frey, 2018; NOU 2012:14, 2012).
- The Norwegian Police Security Service inability to detect and prevent the perpetrator and his planning.

How did then the responses to the mass casualty events of 22 July 2011 influence trust in vital social functions? A report commissioned by the 22 July Centre in Oslo studied trust in various social institutions after the attacks 22 July 2011 (Steen-Johnsen, Enjolras, Solheim, & Winsvold, 2018). The study found a rapid increase in trust immediately after 22 July 2011, followed by a gradual movement back to the trust levels before the attacks. It is worth noting the high level of trust in the police in the months after the attacks, and that a strong media criticism of the police response did not affect the populations trust in the police force. However, after the publication of the 22 July report, a fall in trust level affected primarily the police authorities, not the local police (Steen-Johnsen, Enjolras, Solheim, & Winsvold, 2018). To discuss reasons for this reduced trust in the police authorities would be speculations. However, it is fair to argue that a possible reason could be insufficient prioritization of police preparedness in the years before 22 July, in particular in rural areas. That was also a main issue in the Norwegian police reform after the 22 July (Storting proposition no 61 LS (2014-2015), 2015). Some of the relevant changes coming out of the police reform were:

- A more visible and accessible police force.
- Reduced response time in the event of extraordinary events.
- 95 percent of all calls to the police operations centers must be answered within 20 seconds.
- Larger and more robust police operations centers
- Fewer and more robust police districts
- Emphasis will be placed on management recruitment, management training and management at all levels of the police organization.

Not all of these changes were the results of the lessons learned during the 22 July response. However, it is fair to argue that these changes were required for a more robust police response to mass casualty events.

## 9. Learning and Post-event Investigations

In his study of the Halifax explosion in 1917, Samuel Henry Prince conducted one of the first systematic analyses of human behaviour during disasters (Prince, 1920). A striking part of his research was its explicit acknowledgement of the opportunities following a disaster (Ripley, 2008). Prince quoted St. Augustine in his thesis: “This awful catastrophe is not the end but the beginning. History does not end so. It is the way its chapters open” (Prince, 1920: 12). Since Prince’s pioneering work, there has been extensive research on human behaviour during and after major crises, as well as on the idea that disasters provide learning opportunities for preventive initiatives in the pre-crisis phase and improved disaster responses in the acute phase (Kruke, 2012). There have been studies about, e.g., learning amongst firefighters (Bøhm, 2017; Groenendaal & Helsloot, 2016; G. A. Klein, 1989, 1998; Sommer & Njå, 2011); learning among police officers (Sommer et al., 2015); learning in rescue operations (Sommer & Njå, 2012); learning from crises (Boin, 2008; al., 2016; Toft & Reynolds, 2016); learning from mass casualty events (Henriksen, Brenden, Hoel, Kruke, & Myhrer, Forthcoming in 2022; Kruke, 2012; NOU 2012:14, 2012; Royal Commission of Inquiry, 2020), incident investigation (Carroll, Rudolph, Hatakenaka, Wiederhold, & Boldrini, 2001; Hale, Wilpert, & Freitag, 1997); advance mass shooting research to inform practice (Lopez et al., 2020); barriers to learning from crises (Smith & Elliott, 2007); shared experiences of mass shootings that develop an understanding of the collective experience, consequences and recovery processes following mass shootings (Nurmi, 2017); and how learning may require unlearning certain assumptions and fallacies regarding public crises (Klein, 2011).

Crisis and disasters are often “focusing events”, or agenda setting events (Birkeland, 1997) attracting attention from media, institutions and stakeholders. However, learning following a crisis, or a disaster may be hindered by obstacles such as the political and organizational barriers to effective learning from disasters (Birkland, 1997), blame (Olson, 2000), the politics of investigation (Boin, McConnell, & 't Hart, 2008), and the politics of crisis management (Boin et al., 2005, 2016), all of which may reduce the accountability of, and hinder, the important learning processes in the post-crisis phase. There are, in other words, lessons we

don't learn (Donahue & Tuohy, 2006). Nevertheless, mass casualty events will happen in the future, and we must therefore take advantage of any learning opportunity that we can.

Learning is not correlated with blame. As stated in the 22 July report, it is the perpetrator and no one else who is to blame for the loss of precious human lives, for physical and mental harm (NOU 2012:14, 2012). Learning is also not only about mistakes. Many scholars argue most of all for learning from mistakes. But learning from successes are also important. In his research on resilience engineering, Hollnagel and colleagues have argued that we often begin with asking why things go wrong in our attempts to map the assumed causes and thereby to make sure that they do not happen again (Hollnagel, 2014; Hollnagel, Woods, & Leveson, 2006). We need to fix what went wrong, but we also need to take care of what went well. Look also for the important non-technical skills (Flin et al., 2003; Flin, O'Connor, & Crichton, 2008) that are required for reliable and robust operations. In other words, an important complementary strategy is to ask how and why things were managed well and then to try and ensure that they happen again (Hollnagel, 2014; Hollnagel, Woods, & Leveson, 2006).

Post-crisis investigations almost always reveal human errors at the sharp end (Cook & Woods, 1994; Dekker, 2006). If such individual human errors become our sole focus, however, then the solution will likewise be focused on merely weeding out the "bad apples" (Dekker, 2006). Another and more promising way of understanding human error is that it is a symptom of wider problems within a system (Dekker, 2006). Instead of looking for where individuals went wrong, examine how people's assessments and actions made sense at the time, given the circumstances that surrounded them (Dekker, 2006). Thus, when conducting investigations following mass shooting events, it is imperative to look beyond specific actions by response personnel and seek a deeper understanding of what led them to make such decisions during such a response. There may be relevant explanations at the organizational and systemic levels that could provide a richer understanding of specific actions/inactions at the field level. These explanations may have something to do with:

- Everyday workplace priorities
- Economic priorities
- Cooperation (or lack thereof) between interdependent agencies (i.e., "silo" thinking)

Learning and Post-event Investigations

- The structure of response organizations and operation rooms
- Communication, horizontally and vertically, in and between response organizations
- Strategies for crisis communication inside the response organizations and also with the public
- Training strategies (functional and full scale)
- Technical equipment for coordination and information-sharing (command, control, and information systems)

## 10. Conclusions

Crises must be met with a nation's full capacities. This broad principle gives direction both to our proactive work in the pre-crisis phase, when the focus is on prevention and preparation, and to our efforts in crisis management during the acute phase. Ultimately, the successes and failures of first responders are a reflection of their training, equipment, and the resources invested in the organizations and systems within which they work.

Reliable crisis response relies heavily on our capacity to gather information, share the information across organizational levels and boundaries, and build collective situational awareness as the foundation for timely and proper decision-making. Research on crisis management and experiences from mass shooting events have both highlighted the challenges of horizontal and vertical information exchange and reliable decision-making internally in various response organizations, as well as the challenges of collaboration across multiple response organizations. Thus, facilitating both inter-agency and intra-agency interaction must therefore be a priority.

Strategies for crisis management understandably tend to focus on the response of police and other first responders. But when considering how a society is likely to respond to a crisis, it is important not to overlook the role of the public. In many fast-developing crises, such as mass shooting events, the public are often on their own in the immediate, initial phase. Moreover, mass casualty events have shown how witnesses, passers-by, and other members of the public can make positive contributions during an acute crisis, in particular if they are informed on what is going on. Thus, emergency planning and crisis management plans, as well as training and exercises, should account for and capitalize on the public's capacity to be part of their community's crisis response.

The willingness and commitment to learn from a traumatic mass casualty event can be decisive for building future capacity in response organizations and for rebuilding or even enhancing the relationship of trust between the population and the authorities. Learning is in many ways about changing behaviour based on the recommendations in after-action reports. In change, we see that learning is a priority...!

#### 10.1. Recommendations for Future Research

- Further studies of past mass casualty events to improve both prevention and response
- Studies of prevented attacks
- Comparative studies of mass shooting events with other violent attacks
- Studies of information-processing in and between response organizations
- Studies of the police capacity to manage large operations in response to mass casualties in rural areas
- Studies of the relevance of education, training, and exercises in and between response organizations in mass shooting events
- Studies of equipment, training, and standard operating procedures (SOPs) in crisis communications internally in response organizations, and in particular communications directed towards the public.

## Executive Summary

Academic research and professional debate on policing have long sought to understand whether police officers share a distinctive way of viewing and acting within their role. The existence of what has become known as ‘police culture’ has been an enduring topic of discussion since the 1960s and continues to be widely debated today. Within the field, there is a preoccupation with the day-to-day values, belief systems, and working practices of rank-and-file officers, with successive generations of researchers noting similar features within the occupational culture. Increasingly, however, portrayals of a monolithic, inflexible, and negative police culture have been subject to robust critique. Yet there is sufficient evidence from research and inquiries that police services in different countries exhibit at least some of the qualities captured by the term, and as a result, a common conclusion is that changes are needed to elements of police culture(s).

Against such a background, the scope of this report is to describe and examine key research conclusions emanating from the literature on police culture, as well as the efforts implemented to encourage change on the ground. In particular, the report:

- explains the social science methodology of ethnography, setting out the value of ethnography to policing research and understandings of police culture;
- supplies a definition of the central concept of ‘police culture’ and discusses what have been characterized as key features of police culture over time and in different settings;
- identifies some standard strategies used by police services to change aspects of their culture, noting the possible reasons for the success and failures of these strategies; and

## Origins, Features, and Reform of Police Culture

- focuses, where possible, on attempts to influence police culture with respect to family violence, gender-based violence, and the provision of equitable policing services to racialized groups, as well as the success and failures of these initiatives.

The intricacy of the themes within the police culture debate, and discussed within this report, makes it difficult to summarize in a few sentences or words. Nevertheless, the reflections at the end of this report present the main consolidated discussion points and policy-focused demands for change emanating from previous research and thought.

### **I. The Important Role of the Police**

In modern democracies, the police are recognized as the most visible of all criminal justice institutions. Police officers are bestowed with a broad range of powers to stop, search, arrest, and detain members of the public, as well as to deploy covert and undercover methods for gathering information that is transformed into intelligence to inform police operations. The police are also typically the first state agents that suspects encounter, therefore heavily influencing who enters the criminal justice system and who potentially comes to be ascribed with criminal status (McConville et al 1991). Uniformed police officers largely symbolize and represent the body politic, and it follows that the practices of policing provide the public with some of their most tangible experiences of the state, powerfully shaping feelings of citizenship (Skinns 2019) and national belonging (Parmar 2011). Indeed, much research demonstrates that when people perceive policing to be unprofessional, unfair, or intrusive, not only is trust in the police lost, but police—and state—legitimacy may also be damaged and co-operation withdrawn as a result (Jackson et al 2012).<sup>1</sup> As many policing researchers have noted, the capacity to use legally

---

<sup>1</sup> It should be noted, however, that the exclusive domain of the (state) police has been challenged by the arrival of other actors who are providing policing services. The contemporary 'pluralized' policing field comprises a multiplicity of public, private, and voluntary organizations. These include but are not limited to private security officers, border enforcement personnel, and neighbourhood watches. See Lister and Jones (2016).

## Origins, Features, and Reform of Police Culture

sanctioned force against members of the public sets the police apart from other (state) institutions (Bittner 1970; Fassin 2015). In short, policing plays a significant role in culture, connecting police officers to state legitimacy, politics, and the social order (Loader and Mulcahy 2003). As discussed further below, the images and iconography associated with police work—from uniforms and badges to vehicles and flags—have important symbolic appeal for both police officers and the public.

In most contexts, the police mandate refers to an authorization to act or conduct operations in the public interest in accordance with prevailing laws and regulations with the power and authority of the government. In their day-to-day work, the police are broadly responsible for the maintenance of public order and the prevention and detection of crime. Many police researchers have nevertheless drawn attention to the paradoxes of policing in liberal democracies (Banton 1964; Bittner 1970; Loader 2006; Baker 2008). First, the police role inherently involves the application of force in societies that are, at least notionally, dedicated to peace and the rule of law. Second, while the police are arguably the most important provider of citizen security and safety, they are an agency that presents a threat to security and well-being when officers abuse their powers or respond inadequately to calls for assistance. Third, the police are required to adhere to the due process rights of suspects whilst simultaneously striving to detect, prevent, and control crime (Humble 2020).

The police are a vital and powerful social institution that serve as a visible nexus for a range of relationships between individuals, communities, and the state. As a result, they have proved to be an enduring topic for research and inquiry throughout the decades. Early research sought to understand how police officers working on the ground see the social world and their own place within it. The relevance of ‘police culture’ emerged as a central concept to explain the

## Origins, Features, and Reform of Police Culture

accepted practices, rules, values, and principles of conduct that officers apply to practical situations in the course of their work (Skolnick 1966). Understanding the worldview and perspectives of the police was particularly important because it became apparent that officers exercise considerable discretion in their everyday work and, as a result, can decide where and on whom to focus attention. It was also noted that through discretionary powers, police actions can deviate from the law and organizational guidance (Reiner 2010; see also Brown 1981). On the one hand, researchers found that certain groups of people are *over*-policed as suspects of crime. For instance, officers tended to focus their attention on underprivileged sections of society, such as the homeless, drug addicts, and minority ethnic groups (Bittner 1967). Conversely, other groups are *under*-policed as victims of crime, with female victims of domestic and intra-family violence subjected to chronic neglect by the police (Parnas 1971).

The occupational culture of the police has historically been portrayed as a major factor in shaping the way police officers conduct their everyday work, with researchers continuing to explore whether officers share a distinct and identifiable set of beliefs, values, and assumptions that influences how they think about their role and perform their work. In an attempt to synthesize the dominant themes within the police culture literature, Reiner (2010) has outlined the ‘core characteristics’ of police culture as comprising: an exaggerated sense of mission towards the police role, with officers craving work that promises excitement; the celebration of masculine exploits, with a willingness to use force during interactions; privileging on-the-job experience over official directives and guidance; a suspicious disposition that stereotypes certain people, places, and events; feelings of social isolation from ordinary (civilian) members of the public; and a defensive sense of solidarity with colleagues. In addition, police culture is often marked by cynicism, pessimism, secrecy, and a warped sense of humour. It is alleged that the

## Origins, Features, and Reform of Police Culture

perennial features of police culture are impervious to change and can have an impact on the service that different sections of society receive—often for the worse (Reiner 2010).

However, a growing number of researchers have called into question both the existence and conceptualization of a monolithic and negative police culture. They advocate for a more nuanced and diversified way of understanding the complexities of police identity. Focusing on apparently common and negative traits in police culture is unhelpful, resulting ‘in crude generalisations ... so as to make the results virtually meaningless’ (Hobbs 1991: 606). There is also consensus that if there is indeed a police culture, then it has the potential to transform and respond innovatively to change (Sklansky 2007; Wood et al 2008; Charman 2017). To be sure, developments in society and in police organizations can be expected to reshape the cultural expressions of police officers. These changes include but are not limited to: the cultural, racial, ethnic, and gender diversification of police organizations and demands for recognition of gendered and cultured identities in broader society; the impact of operational changes such as community policing philosophies and shifts in police function; a trend towards citizen surveillance of officers and the influence of official critiques of the police. Authors have also challenged traditional interpretations of police culture by critically interrogating its assumed homogeneity and universality. The occupational culture can vary according to individual officer, rank, department, and force. In order to reflect the nuances in what has traditionally been seen as the dominant culture, scholars argue that discussions of police culture are better referred to in the plural—that is, as police *cultures* (Cockroft 2007; Westmarland 2008).

These critiques imply that police culture may be losing its usefulness as a concept. Understandings of police culture have been overstated in some accounts, but there are nevertheless reasons to continue to research and debate the topic. It cannot be overlooked that

## Origins, Features, and Reform of Police Culture

successive generations of researchers have observed via observational research prominently similar characteristics in the narratives, sentiments, and actions of police officers working in different time periods and across varied jurisdictions. When asked, police officers *themselves* have acknowledged, defined, and described traits of police culture (Chan et al 2003).

**1. Outline of the Report**

The aim of this report is to provide a comprehensive review of the research on police culture to date. The discussion is organized around four principal sections: The first defines and highlights the importance of ethnography as a valuable research method for observing, documenting, and understanding the working culture of the police. In the second section, I discuss influential definitions of police culture and provide analysis of its key features and sources as noted by early and contemporary researchers. This section also provides a substantive critique of the way police culture has been conceived and portrayed, as well as a review of available research regarding police symbols and insignia. Beginning from the commonly held view that aspects of police culture are nevertheless perennial and difficult to change, the third section of the report reviews the main strategies adopted internally within police organizations to bring about cultural change. The final section provides an examination of how (inter)national scandals and pivotal moments within policing histories have the potential to exert external pressure and embed strategies for reforming police culture.

The research underpinning the report does not include the firsthand collection of new primary or empirical data. The forthcoming discussion is based on academic articles, books, chapters, and other relevant, publicly available secondary data. The literature was located through the input of key search terms relevant to the scope of the report and via an array of online databases (such as JSTOR, Applied Social Science and Index, and ProQuest), alongside

## Origins, Features, and Reform of Police Culture

hardcopy resources. Where appropriate, aspects of the discussion draw upon empirical examples from my own ethnographic research with police officers, including, for instance, fieldnote extracts and interview narratives. In addition, the report includes suitable examples from other researchers who have explored police culture in different countries and settings. However, it should be noted that accounts of police culture have flowed from a series of ethnographies conducted from the 1950s onwards and usually in Anglo-American contexts. Therefore, the contemporary relevance of these classic studies for understanding police culture today, and in different countries, should not be taken at face value. Evidence for the existence of and prominent themes within police culture remains contextually specific and not easily generalized.

## 2. Canadian Ethnographies of Policing

A number of important ethnographies have shed light on the realities of policing outside of the American and English contexts. While ethnographies of policing in Canada appear to be few and far between, several are worthy of note. Richard Ericson published two major titles stemming from his ethnographic research with police in Canada. In *Making Crime: A Study of Detective Work* (1981), Ericson explored detective work and its place within policing in Canada by observing six detective units over a total of 179 shifts. He set out to understand detectives' use of discretion in constructing cases and their results. Ericson found that detective work is autonomous, operates in conditions of low visibility, and is reactive rather than proactive since cases are largely initiated by complainants and patrol officers. Yet once detectives assume ownership of a case, they draw on their discretionary powers to steer and shape the investigation, including making choices about what investigations to take on, what questions to ask, and how to interpret the answers (Ericson 1981). Discretion is also involved in writing the official accounts of the case and in dealing with complainants and suspects. With its focus on non-uniformed

## Origins, Features, and Reform of Police Culture

officers working within specialist units, this study made a significant contribution to the literature on policing and police culture.

Second, Ericson's publication *Reproducing Order: A Study of Police Patrol Work* (1982) provides one of the few in-depth studies of Canadian police work from the perspective of uniformed patrol officers. His findings were based on observations of 348 shifts or 1323 patrol officer–citizen encounters in an unnamed municipality of Ontario (Ericson 1982). Through his fieldwork, Ericson found that the work of patrol officers is governed by a distinct set of 'rules', including criminal-law rules, administrative rules, and those rules within the occupational culture. Together, these formal and informal rules present officers with a sense of order and a basis on which to conduct their routine activities so as to reproduce that order. Ericson's research also considered the internal occupational environment and culture of the officers being studied, in addition to addressing the diverse aspects of patrol work. The study illustrates the broad discretion police officers have in deciding whether or not to contend with a certain complainant or suspect. Ericson also noted that officers are highly selective in their application of the law (Ericson 1982). His overall argument was that policing both generates and reproduces the nature of the social order; the choices officers make in their everyday work can increase the disadvantage experienced by underprivileged sections of society, such as the homeless, drug addicts, and others who live on the edge. Ericson also offered a helpful description of how his ethnographic study was conducted, providing insights into the difficulties of gaining access to the world of patrol officers. As he noted, being granted formal entry by senior officers can in fact *heighten* the suspicions of the lower ranking members of the police organization.

There is a recent study by Holly Campeau (2016), whose PhD thesis, *Policing in Unsettled Times: An Analysis of Culture in the Police Organization*, explored police culture in an

## Origins, Features, and Reform of Police Culture

occupational landscape that was undergoing change. Drawing on rich, ethnographic fieldwork that included 100 interviews and observation data collected over eighteen months in a police department in a Canadian city, she has provided a nuanced and up-to-date account of police cultures (Campeau 2016). Her key findings were: that police culture should be reconceptualized within the literature as a resource that officers employ in times of stress and direct challenge; that citizen surveillance of the police (via smartphones, for example) contributes to officer insecurity; that traditional themes of solidarity and brotherhood among officers are being eroded; and that the top-down, hierarchical approach to implementing change in the police is inadequate, but new generations of police officers can play a key role in transformation. Campeau has subsequently published various aspects of her ethnography (Campeau 2015; Campeau 2018; Campeau 2019).

Another ethnography conducted with police in Canada is by Sanders et al (2015). This is noteworthy because it provides rare insight into how the police draw on and deploy intelligence analysis and risk technologies, in addition to providing an understanding of the organizational changes stemming from the engagement with such technologies. As the authors have explained, ‘In light of the ever-growing incorporation of scientific knowledge and technology in Canadian policing, it is of vital importance for criminologists to ethnographically study the ways in which police services construct knowledge about crime’ (714). The empirical investigation included 86 interviews with crime analysts, patrol officers and others involved in crime analysis, as well as 36 hours of observation with patrol officers and those involved in crime analytic and information management workshops. The authors found that the occupational culture of the police is influenced by the cultural, organizational, and everyday activities and routines of police work. In particular, the police do not simply *adopt* intelligence-led approaches to policing. On the contrary, they actively *translate* it and, moreover, as a measure to demonstrate accountability

## Origins, Features, and Reform of Police Culture

(714). The authors also observed a culture of ‘hoarding’ intelligence, thereby—and paradoxically—challenging the underlying principles of proactive policing practices. Overall, the study by Sanders and colleagues offers an important examination of police innovation and reform in a Canadian context.

## II. Ethnography and the ‘Discovery’ of Police Culture

Ethnography (from the Greek words *Ethnos* meaning *people* and *Graphein* meaning *writing*) is a research methodology that lends itself to the study of the beliefs, social interactions, and behaviours of small societies and groups of people, with observation and participation over a prolonged period of time (Naidoo 2012). Broadly speaking, an ethnographic approach is ‘a detailed, up-close investigation of both the subjective and the objective aspects of cultural life—that is, of the many ways in which humans organize, live in, and give meaning to the world’ (McGranahan 2018: 7). Its origin lies in the tradition of anthropology in which researchers’ technique was to immerse themselves in the culture of the society or group under study in order to describe life in vivid detail (O’Connell Davidson and Layder 1994). This entailed becoming an accepted member of the group, participating actively in its cultural life and everyday practices. ‘Being there’ allows ethnographers to directly observe the daily activities and social interactions of those under study (Geertz 1988), as well as providing opportunity to experience the mundane and spectacular moments that touch and shape their lives. In so doing, ethnographers form close relationships with their research participants and engage in many unrehearsed, on-the-spot conversations to elicit their views and understandings of various topics. Fieldnotes are central to ethnographic practice, as they offer a written report or account of that work. Ethnographers rely extensively on their fieldnotes because it is from this body of material that key research findings and patterns emerge.

## Origins, Features, and Reform of Police Culture

With its emphasis on participant observation and seeing the world from the point of view of subjects of study, ethnography contrasts strikingly with quantitative methods of research such as surveys. Ethnography differs significantly from the latter type of methods precisely because it examines what people *do* as well as what they say, thereby enabling insightful examination of discrepancies between talk and behaviour—an important distinction for those researching the police (Waddington 1999).

By its very nature, ethnography conducted within the field of criminology is complicated by the fact it involves researching crime, criminals, victims, criminal justice agencies, in addition to other powerful organizations involved in the social control or punishment of people. This is particularly true in the case of ethnographic research *on* rather than *with* the police because they may have ‘much to hide and much to lose’ from the discovery of embarrassing or incriminating data (Reiner 2010). Undertaking an ethnography of operational policing does not only involve engaging with the potentially dangerous world inhabited by the police. It also entails confronting the realities and social impact of police power and the regulatory attempts to constrain that power (Loftus et al 2022).

Although an ethnographic approach is undoubtedly the most appropriate method available to access the inner world of policing (Marks 2005), police organizations are forbidding sites to research. This is largely due to the cultural reflex on the part of the police to be suspicious of outsider, civilian researchers. As a methodological approach, ethnography has proven unparalleled for examining the working rules, tacit understandings, and underlying assumptions that operate beneath what Holdaway (1983) has termed the ‘presentational canopy’ of police organizations. Similarly, speaking as both an ethnographer and serving police officer, Young (1991: 15) has explained that it requires ‘a great deal of fieldwork to reveal much about

## Origins, Features, and Reform of Police Culture

the unspoken agenda which determines many aspects of police practice'. Other approaches to studying the police are largely unsuitable for achieving this end because the methods employed tend to rely on accounts offered by the police officers themselves, whether in interviews or official documents—the authenticity of which is often precisely the question being studied (Bacon et al 2020). Such accounts may be selective presentations that do not necessarily depict the state of phenomena as they genuinely exist and, at worst, may be an attempt to convince the target audience of a particular image or truth that should not be taken at face value.

The origin of ethnography in police studies lies in the 'conflict' phase of policing research, when a series of influential empirical studies sought to capture and expose the culture and behaviour of police officers as they interacted with their various publics and with each other (Reiner 2015). In particular, police ethnographies were set in motion by a series of high-profile police–citizen clashes that characterised much of the 1960s and 1970s, primarily in the United States and United Kingdom. At this time, theoretical developments influenced by symbolic interactionist perspectives led for the first time to a critical focus on state agencies.<sup>2</sup> Attention thus shifted away from those who break the law to those who enforce it (Reiner 2010). This new conceptual lens was accompanied by a methodological turn towards qualitative forms of inquiry, including ethnography, which subsequently allowed researchers to witness firsthand the interior world of the police in a way previously unseen. These early police ethnographies, which were largely conducted by sociologists working within US and UK contexts, produced many of the concepts, themes, and theories that have since become central tenets of policing scholarship. They set the research agenda for those who followed and remain a source of inspiration and

---

<sup>2</sup> Symbolic interactionism is a leading perspective in sociology that addresses the way in which society is both created, negotiated and maintained through face-to-face interactions among individuals (Denzin 2004).

## Origins, Features, and Reform of Police Culture

valuable reflection for policing scholars around the world (Bacon et al 2020). The insights gleaned from early police ethnographies include: how police officers learn the craft of the job from colleagues rather than in the formal training academy (Fielding 1988); the sources of police deviance and forms of corruption (Punch 1985); the influence of informal and extra-legal values and assumptions on the exercise of police discretion (McConville et al 1991); the prevalence of differential law enforcement practices (Bittner 1967); and the many challenges and dilemmas that lie at the heart of policing (Westley 1970).

For all its contributions, however, ethnography is not a faultless methodology. Critiques revolve around the need for researchers to *interpret* elements of the study, and so analysis may not be a wholly neutral exercise. Making sense of what is observed and how findings are presented is a largely idiosyncratic task and often too reliant on the positioning of the ethnographer (Hammersley 2018). At worst, findings may be viewed as biased and unreliable, and there are associated concerns about generalization from single or small numbers of cases within fieldwork. Part of the solution has been to encourage ethnographers to openly reflect upon how their own cultural, political, and intellectual positioning shapes the collection, analysis, and discussion of the data (Hammersley 2018). Another answer is to engage research subjects—in this case, the police—as collaborators (Henry 2017). Police researchers can share fieldnotes and published papers with the police, who may act as auditors of authenticity (Bacon et al 2020). Finally, there may be a particular limitation of ethnography for understanding police culture. There has been a heavy concentration on the day-to-day work of the rank and file, rather than the decisions and behaviours of senior police leaders. This has led some to comment that ‘studies of police culture have been coterminous with patrol culture’ (Reiner 2010: 86).

## Origins, Features, and Reform of Police Culture

Nevertheless, the contribution of ethnography to our understandings of policing is profound, not least because it offers unreplicable insight into the processes, structures, and meanings that sustain and motivate this social group. Today, ethnographic approaches continue to be considered crucial for exposing and documenting the behind-the-scenes values, narratives, and routine activities of the police.

While police ethnographies have principally focused on uniformed officers operating at the bottom of the organizational structure, a number of studies have expanded their reach to examine the working values and practices of specialist units, including plain-clothed detectives (Bacon 2016), firearm units (Westmarland 2001a), and those working in covert and undercover roles (Loftus et al 2016). Other work has focused on newly emerging modes of police, such as non-warranted Police Community Support Officers (PCSOs) (O'Neill 2019). Other scholars have mapped, via ethnographic methods, the mindsets and behaviours of non-state actors who are endowed with policing functions. From illustrative descriptions of the internal codes and activities of the para-police in Canada (Rigakos 2002) to rich accounts of how private UK security officers mark out people for attention (Wakefield 2004; Hansen-Löftstrand et al 2016), ethnography has made substantial contributions to enriching our understandings of policing activity that takes place beyond—and sometimes in partnership with—the state police. In a similar manner, the policing of world borders has become increasingly salient, accruing steady interest from ethnographers wishing to deeply understand how this phenomenon plays out at the coalface (Mutsaers 2014). A series of studies have also examined policing cultures and practices in countries undergoing social and political turmoil, such as post-apartheid South Africa (Glaeser 2000; Marks 2005) and during the ‘troubles’ in Northern Ireland (Brewer 1991). More recent ethnographies in this vein have also presented rigorous analysis of police structures, mentalities,

## Origins, Features, and Reform of Police Culture

and behaviours in transitional and post-conflict societies (Jauregui 2016; Beek and Göpfert 2013; Blaustein 2015). Together, they provide an international, comparative perspective of policing and its cultures in a variety of contexts.

It is well documented that conducting ethnography with police officers can provoke complex practical and ethical challenges (Westmarland 2001b; Marks 2005; Loftus 2009; Jauregui 2013). These include but are not limited to: challenges of securing access; difficulties that researchers face if they encounter police deviance; threats to personal safety while in the field; difficulties securing informed consent while being immersed in a fluid and unpredictable environment; and complications about protecting both the anonymity of officers who participate in the research and the confidentiality of any information that is obtained. In short, police ethnographers are presented with many in-the-moment ethical dilemmas that require careful navigation.

While there is a strong tradition of ethnography within policing scholarship, it is also noteworthy that from the 1980s, police research in its ethnographic form has been challenged by the developing trend towards government-funded agendas that focus on establishing practically relevant theories and evidence that can directly inform and improve police policies, strategies, and tactics (Reiner 1992; Bacon et al 2020). Quantitative surveys, experimental studies, and the search for best practice play a prominent role in the contemporary research landscape and tend to eclipse qualitative endeavours concerned with broader issues of democracy and power (Sheptycki 2018). However, while trends in the funding landscape seem to overlook ethnographic research, police ethnographies have nevertheless endured challenges to the method and are returning to prominence (Bacon et al 2020).

## Origins, Features, and Reform of Police Culture

Given the origins of police ethnography, researchers tend to be ideologically poised to challenge the ways in which policing is done and to whom it is done. There are, however, good reasons not simply to disparage the police in such accounts. This is an endeavour that speaks to the appreciative inquiry operationalized in criminological studies (Liebling et al 2001), including those on policing (Jardine 2020). Police officers have a challenging job, are one agency operating within a larger criminal justice system, and are responsive to the influence of formal policies, management directives, and the law. The position adopted by Karpiak (2016) and his work on *humanization* is germane. He has emphasised the need to generate a constructive and critical assessment of policing alongside an acknowledgement of the ‘fallibility of officers and other traits that are just as essential to what makes the police—as individuals and as an institution—human’ (Karpiak 2016: 6; see also Karpiak and Garriott 2018). If we wish to understand who the police are, what they do, and why they do it, as researchers we need to humanize them (Loftus et al 2022).

The salience of ethnography for comprehending the world of policing in its various guises and settings is well established. It is a method that powerfully brings the backstage of policing to the front of stage. One of the key themes to have consistently emerged from ethnographies is the idea that police officers often share a distinct and identifiable set of beliefs, values, and assumptions that influences how they think about their role and perform their work—that is, the existence of a police culture, or police cultures. It is to these findings that the report now turns.

### **III. Police Culture: Definitions, Themes, and Challenges**

This section of the report provides a detailed discussion of the background to and concept of police culture. In particular, it focuses on influential definitions of the term before outlining what

## Origins, Features, and Reform of Police Culture

has been identified as the core features of police culture over time and in different urban and rural contexts. The section therefore reviews a number of classic police ethnographies that continue to exert considerable influence over this area of study, as well as the works that have subsequently followed suit, providing a thematic discussion of the central characteristics observed within police culture. Increasingly, researchers have criticized the concept and indeed refuted the existence of a monolithic, inflexible, and wholly negative police culture. It is important, therefore, to attend to the critiques as well.

The term ‘occupational culture’ refers to distinctive patterns of thought and actions shared by members of the same profession, reflected in their language, morals, outlooks, beliefs, and traditions (Trice and Beyer 1993). Although most occupational groups have a shared culture—including, for example, teachers, prison officers, lawyers, and health care professionals—the working culture of the police has received significant attention within academic and professional debates. This is mainly due to the unique role that the police play in societies, including their widespread interactions with members of the public on the streets and inside private homes.

There are many different definitions of police culture. For example, Peter Manning has defined it as ‘the accepted practices, rules, and principles of conduct that are situationally applied’ (1989: 360). Janet Chan has suggested that police culture encompasses ‘informal occupational norms and values operating under the apparently rigid hierarchical structure of police organisations’ (1996: 110). And Robert Reiner has referred to police culture as ‘the values, norms, perspectives, myths and craft rules which inform their conduct’ (2010: 115). Collectively, police culture comprises a shared set of values that shapes how police officers perceive and talk about their working environment and influences how they act within it. It is a

## Origins, Features, and Reform of Police Culture

term used to explain how police—particularly officers working within the lower ranks of the organization—make sense of their social world and interact with people in different settings.

The idea of police culture emerged from pioneering ethnographic studies that aimed to bring the hitherto concealed world of the police into sharper focus. Since then, an abundance of research on police culture has identified seemingly recurring themes and characteristics within police culture over time and in different locations. It is valuable to review what is widely regarded as the first authoritative studies of police culture.

### 1. Early Studies

Jerome Skolnick's portrayal of the police 'working personality' in an American police force arose from his broader investigation into the 'effects of a man's work on his outlook of the world' (Skolnick 1966: 42). Skolnick found that (rank-and-file) officers shared a collective culture resulting from the common dilemmas, difficulties, and tensions associated with the policing vocation. Central to these tensions is the potential danger that officers face in their day-to-day encounters with members of the public: the police role is distinctive in that it routinely requires officers to confront situations in which there is an unpredictable element of risk of physical danger. Second, Skolnick noted that the police are the visible symbol of state authority (backed by the potential to exert legally sanctioned force), and this feature places them in a difficult and alienated position from the various publics they encounter. Third, Skolnick observed that these elements of danger and authority within everyday policing are joined by a constant pressure to be efficient and get results. For Skolnick, these inescapable features of the police role converge to produce a 'distinctive cognitive and behavioural responses in police: a working personality' (1966: 42).

## Origins, Features, and Reform of Police Culture

As a response to the potential for danger and unpredictable assault in police work, a core feature of what Skolnick identified as the working personality of police is *suspiciousness* towards people, places, and events (Skolnick 1966). The authority that police bring to bear on their interactions with the public also means that *social isolation* features within the working personality, and this in turn encourages a high degree of internal *solidarity* with colleagues (Skolnick 1966). Skolnick further identified *moral conservatism* as a culturally produced response in police: ‘the fact that a man is engaged in enforcing a set of rules implies that he also becomes implicated in affirming them’ (Skolnick 1966: 59).

Other pioneering studies echoed many of Skolnick’s conclusions. For example, both William Westley (1970), in the American context, and Michael Banton (1964), in the British context, found that the police placed themselves in an oppositional relationship with the public, leading to an emphasis on mutual support and unity with other officers and social isolation from the public at large.

Maureen Cain (1973) also provided a comprehensive description of the occupational ideologies and behaviour of police officers in the British context. Her work is notable because it explored policing in both urban and rural locations. Cain found that urban officers were orientated principally towards a crime-fighting image of their role, even though in practice such tasks formed only a small part of their daily workload. In the eyes of the rank and file, ‘real’ police work was associated with the act of arresting individuals, with police defining the periods in between action-oriented incidents as boring. One way of relieving the boredom of a shift was to make marginally legitimate arrests of individuals who were already known to the police. This provided officers with an opportunity for excitement and also brought kudos. Urban officers viewed themselves separate from the public, and, like Skolnick (1966), Cain also observed rank-

## Origins, Features, and Reform of Police Culture

and-file prejudice and suspicion towards minority ethnic males. In contrast to urban officers who emphasized and championed the crime-fighting part of their role, Cain found that rural constables were more integrated into the communities they policed. She found that relations between the police and the public were friendly, and rural patrols tended to be quiet, harmonious, and unhurried (Cain 1973). Indeed, she underlined just how distinctive rural policing was at that time. While police in urban areas operated as a team, in rural areas officers were isolated from their colleagues and, as a result, more dependent upon their civilian neighbours. Officers also resided in the area where they worked, were more embedded within the community and their families were accorded a distinctive status. By exploring rural policing, Cain offered early insight into how police culture varies according to location.

While other policing scholars made similarly substantial contributions to the field at this time, the early ethnographies noted above are widely regarded as prompting the beginnings of research into the attitudes and behaviours of officers, as well as the day-to-day realities of policing. Above all, they provided a central reference point for subsequent generations of researchers who also set out to explore whether the police possess a distinctive occupational culture.

## 2. 'Core Characteristics'

Robert Reiner (2010) has brought together the key findings of classic and contemporary studies, providing a thematic list of what he has termed the 'core characteristics of cop culture'. This oft-cited conceptualisation considers police culture to be a discernible and patterned set of understandings that help officers cope with the peculiar demands of their work. Within his overarching analytical framework, Reiner (2010) identifies the core elements of police culture as

including: a sense of mission; intolerance and prejudice; suspicion and skepticism; isolation, mutual solidarity, and conservatism.

#### *A. Pursuit of Crime and Excitement*

A central characteristic of police culture is what Reiner has identified as an exaggerated ‘sense of mission’ (2010: 119). Police ascribe great pride to the job of policing, acclaiming its uniqueness and potential to make a difference. The result is that officers invariably interpret their role as one that first and foremost involves fighting crime. Police conceive their role as the protection of the weak against the predatory (Reiner 2010; see also Holdaway 1983). During my own research in an English police force, for example, officers expressed great pride in the mission of police work and celebrated its potential to make a difference, as the following comments demonstrate:

*Bethan:* What were your motivations for becoming a police officer? Why did you join the job?

*Jake:* I know it sounds corny, but I really wasn’t happy with the way things were in society. People were being mugged, raped, burgled, and I thought I could make a difference. I wanted to make a difference to society, to help people.

*Rowan:* I joined for the same reasons. I didn’t join to go on the Community Team to be honest with you. I really joined to go out and lock up people. (Loftus 2009: 90)

The moral imperative to catch criminals and fight crime is of course a noble one.

However, the crime-is-war metaphor within police culture (Crank 2004) means that officers seek out work that is considered exciting and action-packed. In a classic observational study of the police in London, Smith and Gray (1985) found that officers drive at high speed to incidents that do not require rapid response. Other researchers have noted that officers relish the opportunity to participate in incidents offering the lure of excitement, action, and physical prowess (Westmarland 2001a; Ilan 2018) and tend to tell each other stories that glorify thrilling and confrontational encounters (Young 1991; Kurtz and Upton 2018). This outlook can make the police resistant to efforts to redefine their role as one that encompasses less confrontational or community-oriented dimensions (Marks 2005). Indeed, the preoccupation with excitement and

## Origins, Features, and Reform of Police Culture

the search, chase, and arrest of criminals can also mean that aspects of routine policing are considered less important. In the police worldview, incidents failing to conform with perceived ‘real’ police work are referred to as ‘rubbish’ (Holdaway 1983).<sup>3</sup> It has been noted that police officers regard being called to domestic violence incidents as rubbish work, a point explored further below.

### *B. Intolerance and Prejudice*

Racism has been identified as one of the most problematic features of police culture. Non-white officers working within white-dominated organizations have articulated their experiences of isolation and discrimination *inside* policing organizations, and there is a history of harassment and intolerance towards members of racial and ethnic groups *outside* the organization. These aspects of police culture have been explored across the decades and in different countries, including the United Kingdom (Hall et al 1978; Parmar 2020), Australia (Chan 1997; Cunneen 2018), the United States (Williams and Murphy 1990; Headley 2021), Canada (Wortley and Owusu-Bempah 2011), and South Africa (Marks 2005). While several studies have documented overt forms of racism, racial bias can also occur in more subtle ways within police forces. This resonates strongly with the conclusion made in the Macpherson Report (1999) that failure to properly investigate the racist murder of black teenager Stephen Lawrence in London was a consequence of ‘institutional racism’. Many studies continue to conclude that police stop and question racialized individuals at disproportionately high rates (Provine and Sanchez 2013; Shiner et al 2018; Wortley 2019). Other researchers such as Reiner (2010) have pointed out that

---

<sup>3</sup> In British parlance, ‘rubbish’ refers to work of low value that detracts from the more important or more exciting work of chasing and arresting criminals.

## Origins, Features, and Reform of Police Culture

the racism displayed by officers partly reflects the racist tendencies of the broader society from which they are drawn.

Another core characteristic of police culture includes a taken-for-granted masculine ethos, whereby officers display physical and emotional toughness and engage in traditionally masculine activities, such as heavy drinking and predatory heterosexuality (Reiner 2010; see also Young 1991; Westmarland 2001a; Bastarache 2020). Police culture reflects misogynistic and patriarchal ideologies, amounting to what Smith and Gray (1985) notoriously referred to as a ‘cult of masculinity’. Women have encountered difficulty in gaining legitimate acceptance within police organizations, experiencing forms of sexual harassment and discrimination (Martin 1980; Sapp 1986; Heidensohn 1992; Brown 1998; Loftus 2009). Female officers find it particularly difficult to achieve promotion and break into specialist and elite units (Westmarland 2001a; Silvestri 2017). Stereotypical assumptions regarding gender have also underpinned the type of work women perform within the police, often being assigned to roles that have a compassionate element, such as family liaison or community-oriented work (Heidensohn 1992). In a highly gendered environment, female officers are under pressure to either perform the roles that reinforce gender stereotypes or reject part of their femininity by adopting aspects of the masculine culture. Such a choice has been pertinently summed up by Martin (1980), who argued that, as officers, women are forced to choose between becoming *policewomen* or *policewomen*.

In addition to experiencing a complex process of marginalization and discrimination, 2SLGBTQ+ officers have found themselves adopting the values and qualities associated with the prevailing heterosexual culture (Burke 1993; Miller et al 2003). In my own research, gay officers recalled experiences of being met with suspicion and exclusion until they demonstrated their masculine traits—namely overt willingness to ‘back up’ fellow officers in incidents or

## Origins, Features, and Reform of Police Culture

uncomfortably adopting the heterosexist and macho culture of their colleagues (Loftus 2009). One officer described how for three years he invented a dual life, which fictitiously included a girlfriend, in order to conform with the prevailing heterosexual culture.

The masculine culture of policing has also been blamed for influencing attitudes and behaviours towards female victims of crime. In an influential analysis, Edwards (1989) argued that the patriarchal underpinnings of police culture construct domestic violence incidents as inconclusive, low-status work that distracts officers from their ‘real’ police work.<sup>4</sup> In dealing practically with such incidents, officers have historically avoided arresting the (usually) male perpetrators, thereby undermining the legal implications of what has taken place and failing to protect victims from harm (Grimshaw and Jefferson 1987; Stanko 1989). Attending officers merely provided advice to the parties (Grimshaw and Jefferson 1987), an action that essentially redefines this public criminal matter into a private civil dispute (Edwards 1989).

Following years of campaigning and legislative changes, policing reform has attempted to improve the way officers respond to domestic violence. This has involved two major shifts: first, police organizations are expected to take domestic violence incidents seriously, and officers are being asked to be supportive and sensitive in their response to such incidents (Loftus 2009); second, some comprehensive policies have been introduced instructing officers to arrest any assaulting partner where there is evidence of assault—that is, a pro-arrest or mandatory arrest policy for domestic violence (Hoyle and Sanders 2000). Officers appear mixed in terms of their sympathy with victims of domestic violence. In my own ethnographic research, I recorded the following fieldnote when I accompanied a young officer:

---

<sup>4</sup> Edwards (1989) also blamed the wider role of the law for sustaining this bias.

## Origins, Features, and Reform of Police Culture

The report was of a woman being beaten on a street by a male who, it was believed, was her boyfriend. When Nathan and I arrived at the scene, there were four other male officers there from a different shift. They were standing around a young woman who was crying and whose arm was covered in blood. One of the officers was sympathetically trying to coax the name of her boyfriend out of the woman, but she was telling him to go away because she did not want to name him. Another officer became impatient and was saying things like, 'Look love, you are going to have to help yourself'; and, 'Only you can get yourself out of this situation' while another told her, 'We can't stand here all night'.

It was agreed that there was nothing that they could do while she was withholding the boyfriend's name from them. The first officer appeared genuinely frustrated at the prospect of not being able to help the young woman, but the other officers displayed a striking lack of sympathy and virtually blamed the woman for her position. Walking away, Nathan called her a 'stupid slag' and said that she deserved her abuse if she was not going to help herself (Loftus 2009: 130).

As Charman (2019) has noted, the perceived moral character of victims affects the degree of sympathy and professionalism displayed by officers. In some studies, the subject officers were found to be rarely sympathetic to women viewed as somehow contributing to their victimization. For example, in my own research (Loftus 2009) officers' response to gender-based family violence was particularly lacking if the complainant had a history of calling the police about such matters. Their response was particularly deficient if the complainant was perceived as coarse or rowdy as the following incident demonstrates:

[On patrol] An Immediate Response came through about a domestic violence incident on the Hammond housing estate [an area considered by officers to be 'rough']. A woman had been heard shouting out of a top floor window that her husband had hit her. David and Sergeant Jones recognized the address and said, 'Oh for fuck sake, not that daft cow again.' Apparently, the police had been called there on a number of occasions.

When we arrived at the location, the woman was standing on the front doorstep and was arguing with her husband. She appeared to be drunk and was shouting to the police that her husband had hit her, but her husband was denying it. About seven officers had now turned up, and merely stood around and listened to the woman as she started to cry and shout. She was shouting that her young nephew was dying in hospital, and that her husband had hit her for coming back late from visiting hours. She kept repeating the sentence, 'The system stinks' and, as she was saying this, she began to stagger over to where we were standing. At one point when she fell over, her blouse lifted up and exposed her stomach and underwear. By now all of the (male) officers were looking on in a musement and laughing amongst themselves. One officer said to another, 'If she doesn't fucking shut up, I am going to knock her out myself', while another said, 'I'm going to lock *her* up if she doesn't shut up'.

Sergeant Jones eventually went into the house to talk to the husband. After a while he came out and said apologetically to the other officers, 'I am going to have to lock him up—Logan will have my arse if I don't' [Logan was the Superintendent who was responsible for reiterating the current organisational drive on intimate partner and family violence incidents to the rank and file]. However, Jones told his colleagues that the woman had come home drunk and probably 'wound up' the husband, who had subsequently retaliated. Jones and the other officers saw the arrest as an 'arse covering exercise' (Loftus 2009: 132).

## Origins, Features, and Reform of Police Culture

Part of the treatment accorded to the woman in the above incident and to others like her is related to low socioeconomic position. In my ethnography, which spanned both urban and rural locations, the police overwhelmingly dealt with people who were socially, economically, and politically powerless (Loftus 2009). One prominent feature of their culture was the class contempt displayed towards the poor, a potent force of othering (Loftus 2009).

Worryingly, recent research by Goodmark (2015) has revealed that intimate partner abuse by police officers is systemic and may be encouraged by elements of peer socialization and culture.

### *C. Suspicion and Skepticism*

As Skolnick (1966) noted, the pervading sense of danger and unpredictability experienced by police officers means they are alert to anything suspicious. Other ethnographies have identified suspicion as a shared attribute of the police worldview (Holdaway 1983; Holmberg 2003). Through on-the-job experience, police develop an extensive inventory of indicators that, for them, signal a person's possible involvement in crime. Invariably, these markers are driven by aesthetic and behavioural cues in the working environment (Loftus 2009). Suspicion is an entirely understandable and indeed desirable cultural response to the police role and is encouraged by formal organizational training. However, it potentially leads to the stereotyping of certain groups of people and can both reflect and reinforce the patterns of disadvantage within broader society (Fassin 2013). Police work is largely influenced by oversimplified ideas about suspicious people and activities. In the past, non-white individuals have been stereotyped as disorderly, anti-police and inherently criminal (Cain 1973; Smith and Gray 1985; Young 1991; Chan 1997). In the United Kingdom, young black Caribbean men have been particularly

## Origins, Features, and Reform of Police Culture

associated with crime (Hall et al 1978; Foster 1989). I wrote the following fieldnote after one of my first ever shifts with two officers:

Scott and Darren remarked that I had chosen a good time to do my research with them because there were a lot of black gangsters on their patch who were 'causing trouble' for the police. They suggested that the Reservation Estate was the worst for gang crimes because of its high black population. Scott explained that most of the 'black lads' on the estate hated the police—even though they were responsible for most of the gang and drugs related crimes in the entire policing division. Scott and Darren then started to mimic a strong Black Caribbean accent and parodied aspects of 'gang culture' (Loftus 2009: 143).

Some officers deliberately patrolled the estate in order to assert their authority over the area, and this could cause antagonism between the police and some of the minority ethnic residents.

It has also been argued that police possess a uniquely cynical and pessimistic view of their social world. Police see society as deteriorating, with moral standards and respect for authority eroding rapidly (Holdaway 1983). The police often come into contact with people who are experiencing adverse and difficult circumstances, and officers are called to deal with challenging and upsetting incidents. This effectively makes policing a 'dirty work' occupation (Hughes 1958). Added to this, officers encounter people who routinely lie to them and who try to divert the blame onto others. As a result, the police have a jaundiced view of the public (Manning 1977). This became evident in my own fieldwork:

The Area Control Room dispatched Paul and Nick to a job. A car had crashed into the side of a terraced house in Hope Street and had driven off. [...] A few bricks were missing from the house and there was glass all over the pavement. They cleaned up the mess and both surmised that the car was stolen. Two minutes later, the ACR passed all officers the details of a car that had just been reported stolen. Paul let out a sarcastic groan and suggested that the person who reported it was probably the driver of the car that had hit the house. He turned to me and explained, 'He was probably drunk and faked the theft. This job makes you so cynical. You get to think the worst of everyone, even your own mother!' (Loftus 2009: 109)

Such police skepticism can manifest itself in an outwardly detached and unsympathetic manner during interactions (Waddington 1999). The cynical element of the police outlook is also said to extend to senior officers within the organisation (Reiner 1978; Graef 1989). The most common complaint of the rank and file is that their superiors are detached from the 'sharp end' of

## Origins, Features, and Reform of Police Culture

operational policing: ‘from the perspective of the rank and file, senior ranks are divorced from reality, living in a comfortable and trouble-free existence on the upper floors of police headquarters’ (Waddington 1999: 231). This sense of betrayal by management reinforces a marked sense of solidarity among the rank and file and can subsequently thwart top-down reform initiatives (Crank 2004).

A dark sense of humour is an byproduct of the cynical perspective. Although the jokes and pranks police officers play on one another can appear to outsiders as warped and insensitive, humour is an important coping mechanism because it releases the tensions associated with their difficult environment (Waddington 1999).

#### *D. Isolation, Mutual Solidarity, and Conservatism*

The police are portrayed as an insular occupational group that makes a sharp distinction between ‘us’ (the police) and ‘them’ (the rest of the population). The close affinity between colleagues is reinforced by defining features of their job, including working the arduous shift system together; difficulties in separating work from home life; reliance on colleagues in times of danger and pressure; and the isolating nature of their position as the face of state authority. Yet the sense of solidarity within the police can be dysfunctional, particularly when it protects and covers up colleague deviance and infringements of procedure (Mollen Report 1994). In my own research, officers expressed clear interdependence with each other. Group loyalty was especially potent between officers on the same shift:

*Bethan:* What do you think influences the way you do the job?

*Jack:* The biggest influence on you is your peers though...

*Ian:* Yeah, definitely. It sounds really sad, but when you come into work it’s very social. I see more of the lads than I do of my own family! And in a way you all become like family, don’t you?

*Matthew:* It’s very social. My shift, and here, the team spirit is phenomenal. I once got a three-month attachment to another squad, and I didn’t want to leave my shift!

*Ian:* It’s fantastic, a group of people who really give a monkeys about you.

## Origins, Features, and Reform of Police Culture

*Matthew:* And you come back in after a good job that everyone has been involved in, you come back in and think, 'Good job. Teamwork'...

*Jack:* You talk everything out as a team. (Loftus, 2009: 119)

Officers had a clear awareness of what characteristics were important in a colleague:

*Bethan:* As a police officer, what qualities do you think makes an ideal colleague?

*Simon:* You like to think of your colleague as a good friend. We are all good friends, and the police are a family at the end of the day ...

*David:* Yes, yes ...

*Simon:* Someone you can turn to in confidence, and someone who is going to back you up. Someone who you can trust and who is going to be there if you need them ...

*David:* Somebody you can talk to and have a laugh with.

*Donna:* We are all in the same boat doing the same job. And you like to think that we are all singing from the same hymn book ...

*Simon:* The ideal colleague is someone who is the same as you basically. (Loftus, 2009: 120)

In their perceptions of the public, the police make a distinction between the 'respectable' and 'rough' citizenry (Shearing 1981), and this can determine whether or not a person is considered to be deserving of policing services. Those falling into the latter category have been variously classified by the police as 'slags' (Smith and Gray 1985), 'pukes' (Ericson 1982), 'prigs' (Young 1991), and 'scrotes' (Loftus 2009). A morally conservative outlook perpetuates these views (Baker 1985). Recent research by Charman (2019) has found that police officers also sharply delineate between undeserving and deserving victims, contributing to a process of 'informed neglect' that exacerbates the exclusion and alienation of certain people in society.

### 3. Artifacts of Culture: Police Symbols and Insignia

Organizational theorist Edgar Schein (1985) has suggested that the 'artefacts' of organizations—symbols, technologies, clothing, uniforms, and other physical objects—are the most visible expressions of organizational culture. Although research in this area with specific regard to police culture is limited, there are police symbols that have the potential to evoke powerful emotions for officers and the public alike. As Crank (2004) has argued, highly visible signifiers

## Origins, Features, and Reform of Police Culture

of policing such as the uniform, hat, and badge are culturally affirming, pulling together the ingroup (police) whilst drawing boundaries with the outgroup (non-police). The uniform is a particularly potent symbol of ‘cop-ness’ and heroism since, in the eyes of its wearers, it establishes police authority and power (Crank 2004). Police museums are increasingly popular cultural sites, allowing members of the public to get close to and learn about policing and criminal justice. As Joshua et al (2021) have found, there are dozens of police museums within Canada, and the displays heavily emphasize the uniform.<sup>5</sup>

The collection and trading of police memorabilia is an accepted practice within policing, with items exchanged between individual officers and between police forces (Crank 2004). As Terpstra (2020) has suggested, some officer swap and keep police memorabilia to preserve the memory of the past and to also symbolically resist new policing regimes. It is worth noting that laws have been introduced in some countries to control individual possession of law enforcement insignia. This in part relates to a concern that civilian ownership of police memorabilia may result in misleading representation and the false impersonation of a police officer. In the United Kingdom, for instance, the Police Act 1996 states that possession of police equipment is illegal without a lawful purpose.

The images and iconography associated with police work thus have broad appeal for the public. In popular culture, the police are recognizable and prominent figures, as evidenced by their inclusion in many television shows, books, documentaries, and films. As Loader (1997) has noted, the police are an iconized group and even widely marketed as a tourist attraction (4). Gift shops across many countries, including Canada, sell police-related collectables. Just a few

---

<sup>5</sup> The overall argument by Joshua et al (2021) is that accurate and fuller histories of women police are largely absent within the police museums they studied, thereby serving to reproduce the male dominance of policing in Canadian society.

## Origins, Features, and Reform of Police Culture

examples are teddy bears wearing police uniforms, pocket watches and cuff links engraved with police insignia, as well as mugs, key chains, and calendars draped in police symbols. Loader has suggested that popular attachment to the police lies in ‘the idea of an omnipotent source of order and authority that is able to face up to the criminal Other’ (1997: 7). Public connection to the symbols of policing is *affective*—it provokes a deep emotional response to senses of authority and protection and is closely bound up with a person’s sense of self and belonging within the nation (Loader 1997).<sup>6</sup> The phenomenon of collecting police memorabilia is multifaceted and driven by varied motivations, but symbols of policing may appeal to people who crave a sense of security and those attracted to fantasies of discipline and orderliness. However, further research is required in this area.

#### 4. Problematic Consequences of Police Culture

As the above discussion has illustrated, many accounts describe police culture as isolationist, misogynist, racist, and authoritarian. These cultural descriptions stem from everyday interactions the police have within their various environments and the people they meet. The problematic consequences of police culture broadly coalesce around three concerns. First, police culture can result in certain members of the public receiving a poor quality of service. There have in particular been widespread concerns about the under-policing of family violence and the inadequate service that women have received as victims of gender-based abuse (Westmarland 2001a; Carillo 2021). Early studies (Dobash and Dobash 1979; Edwards 1989) revealed the ways that police responses to domestic abuse were insufficient and inconsistent. In her study, Edwards

---

<sup>6</sup> However, Loader (1997) cautions that emotional commitment to policing differs according to social divisions of class, gender, ethnicity, age, and sexuality. For excluded or disenfranchised populations, the symbols of policing may have little appeal and may instead evoke feelings of anxiety and fear rather than pride and belonging.

## Origins, Features, and Reform of Police Culture

(1989) concluded that many officers in two London Boroughs did not comprehend the dynamics and seriousness of domestic violence. As a result, domestic-related calls were commonly viewed as noncriminal incidents and considered a waste of police time. She found that despite physical violence being present on many occasions, the police saw the incidents as disputes rather than as assaults, and arrests and investigations were therefore rare.

In some contrast, I found that there have been important changes in the police response to domestic violence (Loftus 2009). Most officers had incorporated the pro-arrest policy into their routine policing practices, and some were generally sympathetic and professional in their treatment of victims. Some male officers viewed themselves as ‘hero-protectors’ (Westmarland 2001a: 27), displaying a clear desire to apprehend perpetrators. Female officers in particular saw attending domestic violence incidents as a legitimate and worthwhile part of their role (Loftus 2009). However, the extent to which these changes in police practices reflect a genuine desire to provide a better service to victims is less clear. Some officers still regarded these incidents as marginal to their police work activities:

*Ben:* You join the police and spend your lives dealing with domestics, don't you?

*Edward:* It is the same places, same faces every single day. And that's another frustrating element because we are just mopping up after people again and again. [...] The gaffers [senior officers] are big on domestics at the moment, and because of that, we are not being able to do the things that interest us...

*Andy:* The problem now is that we are going out dealing with those types of incidents. And fair enough, technically a crime has been committed by these inebriated people, but we've got paperwork to do for that, and we can't go out and catch the burglars, the rapists and the dealers. We are dealing with drunken domestics—it's crazy. (Loftus 2009: 129)

On the one hand, aspects of police culture pertaining to gender and family-based violence are being revised and unlearned. While multiple policing outlooks and styles can be found and conform with the requirements of new agendas, many domestic violence incidents nevertheless continue to occupy a low position within police culture (see also Grant and Rowe 2011; Myhill 2018).

## Origins, Features, and Reform of Police Culture

Concern has also been raised about the police response to sexual assault victims. For example, Quinlan (2016) has found that despite several decades of institutional reforms in sexual assault policing in Canada, police investigators continue to dismiss a disproportionate number of sexual assault reports as unfounded. Drawing on seventeen interviews with sexual assault investigators working in Ontario, she has described how techniques for assessing credibility and truthfulness in sexual assault cases often rest on normative assumptions about who ‘real’ survivors are and how they behave. Earlier research by Heidensohn (1985) suggested that female victims of sexual offences are likely to be viewed by the police via a narrow range of feminine roles, such as ‘wife’ (a wholly innocent victim) or ‘whore’ (a potent image of female deviance). Such perceptions influence the way the victims are treated by the police and can affect whether or not sexual violence cases are adequately pursued.

The second major problem of police culture is that it can have a negative effect on relations between police officers within the organization, with colleagues from under-represented groups reporting prejudice and exclusion. As police officers, for example, women from many different countries have encountered significant difficulty in gaining legitimate acceptance within police organizations (Garcia 2003; Bikos 2016; Natarajan 2014). As noted earlier, the ‘cult of masculinity’ (Smith and Gray 1985) has historically encouraged various forms of sexual harassment and gender-based discrimination, and the Bastarache Report (2020) has demonstrated that women serving in the Royal Canadian Mounted Police (RCMP) (and provincial and municipal policing agencies) have been experiencing sexual and physical violence and retaliation for decades.

The taken-for-granted ethos of heterosexual masculinity has likewise excluded 2SLGBTQ+ officers from achieving full social membership (Burke 1993; Miller et al 2003).

## Origins, Features, and Reform of Police Culture

Likewise, non-white officers have consistently articulated their experiences of isolation and racial discrimination within policing organizations (Barron and Holdaway 1997; Kochel 2020). However, police organizations have been under pressure to be more representative of the diverse communities they serve, and the demographic make-up of the police is changing in some locations (Sklansky 2006). An allied development is the expansion of civilians working inside police organizations, which has afforded an avenue for cultural, ethnic, racial, and gender diversification in personnel recruitment, although there is a pervasive culture of bullying and harassment amongst police officers and staff (Miller 2021).

The final overarching theme relating to the negative consequences of police culture is that the informal attitudes, values, and behaviours that comprise police identity can act as an obstacle to police reform efforts. As I discuss in further detail later in the report, a body of research has identified much resistance to top-down approaches to reforming police culture, partly because they fail to acknowledge the role played by street-level officers in such cultural processes (Chan 1997; Loftus 2009; Cockcroft 2014; Gundus 2017).

### **5. Critiques of the Police Culture Schema**

According to early scholarly characterizations and to increasingly widespread mainstream images of police culture, police officers possess a range of dysfunctional beliefs, values, and behavioural tendencies that arise as a response to the police role. This shared culture underpins and informs how officers relate to colleagues and members of the public. It is a culture that works in opposition to public service ideals and reform endeavours. The core characteristics (Reiner 2010) described above are believed to be culturally transmitted and reinforced through on-the-job socialization by the immediate peer group. Informal police socialization is presented as distinctly indoctrinating.

## Origins, Features, and Reform of Police Culture

This account has become conventional and has exerted considerable influence, becoming almost truistic. However, recent scholarly research and theorizing has provided a serious challenge to both the conceptualization and existence of a monolithic and stagnant police culture. Broadly, there is a divide between those who adopt a classic approach to understanding police culture based on the ‘core characteristics’ framework described above and those who contend that the occupational culture of the police is fluid and differs according to context, historical period, officer demographics, and context-specific role. As Campeau (2015) has stated, ‘the conceptual template of Reiner’s list now serves as a collective imprint in how we think about the topic [...] and this diverts our attention from new directions and emerging trends’ (36). Since the first seminal ethnographic studies of the police, policing has experienced a great deal of social, cultural, and technological change. These changes include but are not limited to changes to recruitment, shifts in the police function, new forms of accountability, and increased expectations for officers to work with multi-agency partners such as social workers, private security, and mental health professionals. In short, the stability of police culture cannot be assumed.

Australian scholar Janet Chan (1997) has provided one of the most robust critiques of the overarching analytical approach to studying police culture. In what follows, I draw principally upon her work to provide an overview of the key challenges to the orthodox portrayal of police culture.

*A. Variations of Police Culture Based on Role and Context*

Some conventional accounts of the police suggest that police culture is consistent, static, and unchanging. However, a number of scholars have found that occupational culture can vary according to rank, role, department, and force, as well as differing across rural and urban areas.

## Origins, Features, and Reform of Police Culture

One key theme of English studies is that rural officers tend to view the local populace as pro-police and consider policing to be an endeavour *with* and *for* the community rather than policing *of* the community (Cain 1973; Young 1993; Loftus 2009). However, it is possible that this idealized characterization of rural policing has been undermined by the closure of local stations, the increasing use of technologies that may distance the police from their publics, and the routing of calls to the police through centralized, force-wide centres.

Other differences have been found between the culture of uniformed police officers and their plain-clothed counterparts, such as detectives (Bacon 2016) and covert officers engaged in surveillance (Loftus et al 2016), as well as those working in other specialist units, like firearms (Westmarland 2001a). As noted earlier, recent ethnographic research in Canada has explored culture in the context of efforts to integrate intelligence and analytic technologies into the police (Sanders et al 2015). The findings refute the notion of a universal police culture by revealing a plurality of cultures—among, e.g., intelligence analysts, IT operators, and patrol officers—that exists and operates simultaneously within one police organization.

In their influential study, Reuss-Ianni and Ianni (1983) identified a distinction within the working cultures of ‘street cops’ and ‘management cops’. Manning (2007) has since proposed that police organisations are characterized by three subcultures of policing according to rank: command, middle management, and lower participants. Moreover, in providing an account of ‘cultural inertia’ in a Canadian police force, Campeau (2019) has noted division between ‘old-school’ and ‘new generation’ officers. There is evidence of variability in attitudes to and styles of policing between individual officers (Reiner 1978; Fielding 1988; Loftus 2009; Corder 2017).

Contemporary police organizations are also comprised of forms of police officers, such as Police and Community Support Officers (PCSO) in the United Kingdom. PCSOs are a

## Origins, Features, and Reform of Police Culture

policing auxiliary: salaried members of support staff who, unlike traditional police officers, do not hold the warranted power of arrest. The main function of PCSOs is to enhance public reassurance by providing visible uniformed patrol (O’Neil 2019). Ethnographic studies by Cosgrove (2016) and O’Neill (2019) have found that while PCSOs do not construct their own distinctive subculture and are likely to endorse dominant cultural characteristics, they nevertheless demonstrate a departure from *some* classic police culture traits, for example by displaying a strong sense of social service in their work.

Others have found variations in police culture at local and regional levels. In her ethnographic study of the police in London, Foster (1989) found that officers at two police stations only a short distance apart who dealt with similar problems of urban decay nevertheless displayed notably different attitudes, styles, and approaches to their work. Although there are relatively few comparative studies of police culture, studies within this vein have also found significant differences in police culture at the international level. Nickels and Verma (2008) have compared dimensions of police culture across Canada, Japan, and India, identifying broad universality and congruence between officers’ attitudes, but they concluded that some qualities viewed by many as characteristic of all police—such as xenophobia—were not stable across all nations.

Together, such research supports the contention that there are subcultures contained within what is usually presented as mainstream police culture. Yet despite evidence showing clear divergences, representations of police culture tend to generalize police culture as a singular and homogenous entity (Chan 1997; Reiner 2010). In order to reflect the nuances in the dominant culture, scholars have argued that discussions of police culture are better referred to in the plural—that is, as police *cultures* (Foster 2003; Cockcroft 2007; Charman 2019).

## Origins, Features, and Reform of Police Culture

*B. An All-powerful Cultural Force?*

The issue of homogeneity plays a role in the ways that police officers become socialized into their occupational culture. As Chan has argued, most accounts of police culture make the mistake of implying that the ‘acculturation process’ is one way (1997: 66)—that is, it operates as an overwhelming force that consumes police officers once they join the job. Such a deterministic formulation casts officers as manipulated and passive learners and overlooks the ability of police officers to make up their own minds as to whether or not to accept specific features of the culture. Whether, if at all, officers adopt any cultural values depends on many factors, such as their own individual biographies and personalities. Police officers are drawn from many walks of life and do not necessarily share similar outlooks. This also means that police officers can and indeed do exhibit different perceptions of their environment and the people they police. For example, Pichonnaz (2021) has drawn on interviews with new entrants to the police in Switzerland to explore the influence of their previous life experiences before they joined the job on how they see and perform their role. His findings indicate that professional socialization in the police may be a ‘secondary’ form of socialization:

Individuals entering a profession are not empty vessels; they have been shaped by a great number of socialization instances, and especially by primary socialization—i.e., the societal influences they experienced before they became adults—which forms a solid base, most often hard to transform. Therefore, professional socialization cannot have the same impact on all new entrants in a profession (Pichonnaz 2021: 125).

Pichonnaz (2021) has found that the ‘social mobility trajectories’ of new recruits and ‘gender identity’ are pivotal in explaining differences among police officers’ views of their work. Further research on past lives and prior socialization of officers is likely to enhance our understandings of the divisions within police cultures.

While Reiner (2010) has summarized the core characteristics comprising the occupational culture of the police, he too has cautioned that the culture is neither monolithic nor unchanging.

## Origins, Features, and Reform of Police Culture

Rather, police culture is ‘embodied in individuals who enjoy autonomy and creativity’, and variation ‘can be discerned within the broader police culture, generated by distinct experiences’ (Reiner 2010: 116). Even when aspects of police culture are internalized, they do not necessarily determine police behaviour: ‘an important distinction can indeed be made between “cop culture”—the orientations implied and expressed by officers in the course of their work—and “canteen culture”, the values and beliefs exhibited in off-duty socialising’ (Reiner 2010: 85).

### *C. Police Culture as Wholly Negative*

Police culture has commonly been presented in profoundly depressing terms. As Waddington (1999) has argued, the notion of police culture is ‘frequently invoked by academic researchers and commentators to explain and condemn a broad spectrum of policing practice’ (287). By focusing only on the negative characteristics of police culture, researchers fail to take into account positive police behaviours that are equally identifiable. In a general sense, the occupational culture of the police is functional to the survival and security of police officers working in a dangerous, unpredictable, and alienating occupation (Chan 1997). Police culture is a valuable device for supporting officers as they deal with their environments and, in this sense, is a rational response to the irrational world of policing. Indeed, Campeau (2015) has recently argued that police culture should be viewed as a *resource* that actors may choose to employ when faced with particular difficulties and constraints.

It is possible to pinpoint other ways in which aspects of police culture can be interpreted in a positive light. For example, while the loyalty–them–us theme within police culture has been criticized for breeding secrecy and corruption, it can be a source of solidarity and support and nurture a sense of the police as family (Reuss-Ianni 1993). The oft identified issues of mistrust, cynicism, and a continually suspicious mindset can likewise be interpreted as beneficial to the

## Origins, Features, and Reform of Police Culture

core police functions of identifying suspects and protecting the community from crime and harm. And while the police tendency to treat their work as a mission and more than simply a job has been treated pejoratively as a prioritization of excitement and action at the expense of justice and the rule of law, less attention has been paid to the concern for victims—at least those that are considered to be ‘true’ victims—that forms the core of the police sense of mission and contributes to service-orientated approaches to policing. In my own ethnographic research undertaken with police in a rural location, all patrols once provided their immediate and prompt attention to a report of an autistic child who went missing from one of the local supermarkets. Although the child was eventually discovered by a member of the public, officers demonstrated a strong desire to search for the infant and were caring and sympathetic towards the anxious and frightened mother (Loftus 2009).

Moreover, while police culture has been recognized as a powerful obstacle to reform, researchers have also acknowledged that it can be harnessed as a positive tool for regulating and preventing inappropriate police conduct (Toch 2008).

*D. Assumed Insularity from Society*

Another critique of the way police culture has been conceptualized is its assumed isolation from the social, economic, legal, political, and organizational landscapes in which it inevitably operates (Chan 1996). Culturalist interpretations of police culture focus on the immediate peer group of officers and the strong cultural forces that influence their behaviour. However, this approach overlooks the broader contextual influences that shape police thinking and practice. In contrast, some have focused instead on the organizational environment of policing and officers’ places within and relationships to the formal police organization.

## Origins, Features, and Reform of Police Culture

As Paoline (2020) has explained, one of the key differences between an occupational culture and an organizational culture is the locus of cultural influence. While occupational cultures originate from and are maintained by frontline workers, organizational cultures are usually defined from the top of the organization down (Schein 1990). As Paoline has maintained, ‘the point that cannot be overlooked is that organizations that are embedded within an occupation also exert cultural influence on members’ (2020: 204). Other writers have also exposed the influence of police policies, organizational directives, and the law in determining police behaviour. In an influential analysis, McBarnet (1983) went so far as to argue that police officers become the ‘fall guys’ of the legal system, shouldering the blame for any injustices in the operation of the law and other criminal justice agencies. However, other writers have revived occupational culture as a determinant of policing practices and decisions. As Holdaway (1983) has pointed out, law, societal mores, and formal policies can certainly influence policing, but the point is that they become *reworked* to resonate with the preferences of the occupational culture. In a similar vein, McConville et al (1991) have underlined the influence of what they call police ‘working rules’ in determining behaviour, but they have also recognized that policing takes place within legal contexts that are sufficiently permissive to allow the police to work within police-defined objectives. In a similar way, recent work by Sanders et al (2015) has demonstrated how the adoption of police reform in relation to the implementation of intelligence-led policing approaches is shaped by its ‘fit’ within police cultures. Nevertheless, police cultures should not be analyzed in isolation from the wider contexts in which they are situated.

*E. The Supposed Intractability of Police Culture*

Sections IV and V below will discuss more comprehensively the question of cultural change. For now, the final criticism of the way police culture has been conceptualized concerns the notion

## Origins, Features, and Reform of Police Culture

that an insulated, enduring, and all-powerful police culture ‘leaves little scope for a cultural change’ (Chan 1996: 17). This deterministic understanding overlooks the possibility of frontline police officers themselves being at the forefront of change (Marks et al 2017). A realistic and sophisticated formulation of police culture should allow for the capacity of change, as well as resistance to transformation.

### 6. Addressing Criticisms of the Focus on Police Culture

Together, the critiques outlined above imply that monolithic accounts of police culture should be more carefully approached. Policing scholars increasingly argue that analysis in this area should forego crude, overly negative generalizations and adopt a nuanced approach to the study of police culture. This should identify variations and emphasize human agency—that is, the ability of individual officers to make their own choices and shape their own approaches to policing and change (Sklansky 2007). Furthermore, police organizations are continually susceptible to change, including diversity in recruitment, community-based initiatives, agendas relating to professionalization and ethical standards, and, more recently, increasing levels of mediatization, external scrutiny, and accountability (Campeau 2015).

Despite the variation in police cultures that some researchers have justifiably pointed out, others have continued to reveal significant and widespread similarities across police practices and attitudes. It is certainly important to speak about ruptures in *the* police culture, but it may nevertheless be far-fetched to assume that there is so much fragmentation that there are no longer any commonalities (Paoline 2003; Loftus 2009; Reiner 2010). Interrogating the supposed universality of police culture is an important endeavour, but the ‘core characteristics’ that have long been associated with the police emerged from a tradition of informed and theoretically rigorous ethnographic research that has consistently revealed patterns of police attitudes and

policing practices. Moreover, interest in police culture has been revitalized by a succession of high-profile critiques and an increasingly public concern that the occupational culture is one of the main obstacles to police reform.

#### **IV Changing Police Culture: Internal Strategies**

One of the central tenets of police culture scholarship is that entrenched informal values and belief systems held by street-level officers are capable of resisting and ultimately thwarting change efforts. As White and Robinson (2014) have noted, this resistance to change is especially apparent when culture itself is the subject of reform efforts. Moreover, police services also have to be cognizant of and receptive to the imperative of change (Duxbury et al 2018). In addition, it is increasingly acknowledged that change endeavours must take seriously the occupational culture and harness a commitment from rank-and-file officers to the possibility of transformation (White and Robinson 2014). Indeed, analyzing police culture as simply dysfunctional and undesirable overlooks useful strategies for change that originate from rank-and-file officers themselves (Wood et al 2008). This section examines some of the main strategies promoted from *inside* police organizations to reform police culture, highlighting where possible what past and current research suggests about why these programmes of reform are successful or unsuccessful.

##### **1. New Organizational Philosophies, Policies, and Directives**

Frontline police officers can adapt to innovations in policing. For example, one pivotal change in policing is the shift towards community policing. Community policing encourages officers to view members of the public as having a legitimate right to and involvement in policing services rather than as a faceless mass in opposition to the police (Brogden and Nijhar 2005; Nalla and Newman 2013). Much research has been conducted on an international level to assess police officers' attitudes towards community policing. While the overall picture is mixed, it cannot be

## Origins, Features, and Reform of Police Culture

denied that many police officers have a positive view of community policing, incorporating its central tenets into their routine work (Moon 2006; Loftus 2009; Demirkol and Nalla 2020).

Other modifications in police functions and expected role have similar potential to render police culture receptive to change. Take the example of drugs policing. There is growing evidence from the United Kingdom (Bacon 2021), South Africa (Marks et al 2017), and Canada (Landsberg et al 2016) that drugs policing is moving away from traditional law enforcement responses towards a greater focus on harm reduction. At the policy level, change is apparent in the growing number of police-led diversion schemes that offer alternatives to arrest, prosecution, and criminalization by instead offering support for addressing drug use and associated problems through education, treatment programmes, and social support. It is also becoming increasingly common for frontline officers to carry and administer emergency antidotes (such as Naloxone) for overdoses caused by heroin and other opiates. Multiagency cooperation, whereby police officers work closely with drug treatment services or probation services, is also credited with improving police officer responses, including their knowledge about drug users and roads to recovery (Bacon 2021). According to this research, these shifts, together with new expectations and expansions in policing function, are moving police culture away from stereotypes and misconceptions of drug addicts as weak-willed people who make bad choices and directly influence the non-arrest and decriminalization of this group.

The study by Landsberg et al (2016) set out to explore how high-intensity policing activities undermine public health efforts in Canada. They were concerned that the widespread police practice of confiscating injecting drug users' paraphernalia was leading to an increase in the sharing of syringes and elevated risk of HIV infection. Drawing on a case study of changes in drugs policies by the Vancouver Police Department, including those emphasizing harm-

## Origins, Features, and Reform of Police Culture

reduction approaches, Landsberg et al (2016) found a significantly lower prevalence of harmful policing practices, including confiscation and physical violence by officers. However, while drug users were less exposed to negative policing practices, they were still engaging in HIV risk behaviours. This study is germane for our understandings of police culture because the officers appeared to adhere to the *spirit* of the newly introduced drugs policy, demonstrating that a major shift towards a public health approach to policing is possible for a major police department (Landsberg et al 2016).

Similar research in other contexts by Bacon (2021) and Marks et al (2017) likewise shows that police forces can respond positively to shifts in policy, and officers working at the sharp end of policing can develop new ways of thinking and behaving. In the context of drugs policing, change in police culture is possible because of alterations in the broader structural field of policing (particularly the introduction of new policies and directives) and changes in the values and assumptions that frontline police officers have about drug users and the perceived ineffectiveness of enforcement practices (Marks et al 2017).

## 2. Transformational Leadership

There has been a sustained interest in the prospect of new police leadership models as a promoter of reform within police organizations (Cockcroft 2014), although the impact of transformational leadership in hierarchical organizations such as the police continues to be under-researched.

While traditional leadership models rely on the enforcement of asymmetrical contractual relationships between bosses and subordinates, transformational approaches are based upon the values of ‘participation, consultation and inclusion’ (Silvestri 2007: 39). Implementing leadership in this way can serve to erode the cultural barriers that may exist within the police organizational hierarchy. Transformational leadership has the potential to positively influence

## Origins, Features, and Reform of Police Culture

performance, to improve communication, organizational citizenship, and commitment, and therefore to enable legitimate organizational change (Aymerich et al 2021). In an important study, Silvestri (2007) conducted in-depth interviews with 30 senior policewomen to explore the way in which women in leadership positions carry out their roles. She found that they adopted distinctly different leadership styles and ways of working than has traditionally been the case within police organizations, and these tended to mirror the consultative and participatory approaches central to transformational leadership. Silvestri (2007) has thus underscored the immense potential of female leaders to change policing cultures.

Marks and Fleming (2004) examined transformative leadership in the context of the South African Police Service (SAPS) as it underwent much restructuring and reform in line with moves to a more democratic and community-oriented institution. Although efforts were introduced to embed more participatory management strategies, their ethnographic case study of a Public Order Policing Unit within SAPS has demonstrated that both management and rank-and-file officers continued to embrace old and established ways of thinking and related practices. The failure of this new mode of management was a combination on the one hand of ‘the power of symbols and rituals in police organizations, particularly established meanings associated with “discipline”, and on the other hand because police managers are usually not equipped to direct workplace restructuring’ (Marks and Fleming 2004: 786).

While some scholars such as Cockcroft (2014) have argued that the application of transformational leadership models to policing contexts is not straightforward, there is mounting agreement that police organizations may benefit from leadership styles that are not based upon the traditional hierarchy-reward-punishment model (Brown 2003; Marks and Fleming 2004).

### **3. Rank-and-File Participation in Reform versus Top-down Command**

One point emerging from the above discussion is the potential of bottom-up approaches to police reform (Sklansky and Marks 2008). Outside of policing, three arguments are commonly made for involving employees in workplace decision-making and change processes: it heightens morale and commitment, develops democratic skills and habits, and makes for better decisions overall (Sklansky and Marks 2008). A study by Wood et al (2008) has shown that cultural change is possible when police officers are actively involved in the process and contribute their own views and experiences to solve problems. Their research examined the Nexus Policing Project, a collaboration between police and a university in Victoria, Australia. The process entailed academic researchers proactively involving police officers in solving practical problems. This hands-on and collaborative approach to participation and reflection is known as participatory action research (PAR) (Wood et al 2008: 74). In operationalizing PAR, Wood and colleagues have found that there is much potential for officers to ‘challenge the beliefs and meanings that inform their daily practices... [Officers] are able to alter their routines when innovative practice and new ideas assist them in responding to new dilemmas’ (72). However, while police members can become successful change agents, the predominantly ends-focused, conflict-based, and task-oriented character of police organizations nevertheless undermines novel ways of thinking about and doing their work (Wood et al 2008).

Similarly, Bayley (2008) has argued that senior leadership would do well to make a concerted effort to embed and involve frontline officers into reform initiatives by utilizing the important craft knowledge learned on the street for adaptive reforms. Similarly, Toch (2008) has emphasized the importance of harnessing the ‘street wisdom’ of frontline officers, alongside participatory management. He reviewed a discrete intervention in one Californian police department called the Peer Review Panel. This was established to regulate excessive force by

## Origins, Features, and Reform of Police Culture

officers, but importantly, the unit was not conceived as a disciplinary entity. Instead, it was run by frontline officers—some of whom had problematic histories of using excessive force against the public—and involved meeting twice a week for several months to review behavioural patterns and encourage self-critique. As Toch has noted, the strategy was ‘premised on the assumption that personal development and organizational development could be linked’ (2008: 69). The officers had a stake in studying and reflecting upon the problem of conflict with citizens and were therefore best placed to fully comprehend these encounters and offer solutions.

Despite the promise of enlisting frontline officers as key change agents, empirical research into the success—or indeed failure—of such participatory approaches in cultural change endeavours remains uncommon.

#### **4. Recruitment and Promotion of Officers from Diverse Backgrounds**

Police organizations have been criticized for employing police officers who do not reflect the diverse communities they serve. A commitment to diversifying the predominantly white male composition of police workforces in the Western world may dampen the effects of traditional police culture by introducing new actors with different perspectives and approaches. As police organizations become staffed by more civilians, university graduates, women, people of colour, and 2SLGBTQ+ personnel, there is a realistic expectation that internal cultures will adapt to better reflect the diverse experiences and outlooks of their members (Punch 2007; Sklansky 2007). The establishment of internal support associations organized around race, ethnicity, gender, and sexuality signals a mainstreaming of diversity and anchors the acquisition of new power and status by officers from previously marginalized populations. There is evidence to suggest that the working environment of police organizations has been transformed by greater recognition of cultured and gendered identities within the ranks. In my own research, officers

## Origins, Features, and Reform of Police Culture

from previously under-represented backgrounds have appeared less skeptical that discrimination can now be challenged and that formal complaints will be listened to and acted upon by managers. The perception is that the organizational emphasis on diversity and discrimination has significantly reduced overt expressions of racism (Loftus 2009; see also Souhami 2014).

However, the institutionalization of diversity has also produced workplaces where relations can be sensitive and fractious. I have found that the extension of recognition for marginalized groups sits uneasily within the culture of rank-and-file officers, who speak resentfully about the revised emphasis on diversity (Loftus 2009). Evidence of what Campeau (2019) has described as ‘cultural inertia’ has also been observed by Murray (2021), who examined the ways in which Canadian police officers view and enact gender in their workplace. Drawing on interview data, she has found that though most male officers deny and dismiss gender differences and bias, female officers on the other hand describe continuing experiences of workplace sexism and deploy adaptive strategies daily in their workplaces to resist gender inequality (Murray 2021; see also Bastarache 2020). Also of note is research by Couto (2014), who set out to explore how culture is perceived by and impacts the workplace and career experiences of lesbian, gay, bisexual, and transgender police officers in Ontario. Interviews showed that most officers believed their status and relationships in the workplaces were more positive compared to other eras. However, officers also believed that police culture still fundamentally retained a hypermasculine and heterosexual orientation. It is noteworthy that Couto conducted his research almost ten years ago, meaning that up-to-date research is needed to examine self-reports of exclusion and harassment. Hiring and promoting more women, those from 2SLGBTQ+ backgrounds, and officers from racially and ethnically diverse backgrounds may not on its own be enough to radically change the culture of policing. Nevertheless, there are

## Origins, Features, and Reform of Police Culture

studies that show how these officers can contribute new perspectives and distinctive characteristics to workplace identities that ultimately have positive effects on police organizations (Chan et al 2010; Rabe-Hemp 2018).

### **5. New Recruits and Police Socialization**

Research by Charman (2017) in the United Kingdom has demonstrated that police forces today attract and comprise a new guise of officer who is committed to communication, compassion, and empathy as their guiding framework for conducting their work. She has found that contemporary cohorts of police recruits are partially dubious about law enforcement as their primary mandate when they join the job (Charman 2017). However, Charman has also found that as time goes by, new recruits state that their desire to make a difference is undermined by austerity and a perceived lack of support from supervisors and the public, with officers demonstrating increasing levels of cynicism as a result.

It is worth noting that there have been fundamental changes to the point of entry of new recruits into the police organization. Especially in the United Kingdom, Direct Entry schemes allow a person to join the police at a senior level, representing a radical shift from the British policing principle that all new recruits have to start at the bottom—that is, at the lowest rank of police constable. Fiscal uncertainty, a lack of varied perspectives within the most senior ranks, cultural inertia, and under-representation of diverse communities have culminated in a desire to look for new ways to develop and recruit officers (Winsor 2012; Loveday 2013). From a police cultural perspective, direct entrants who join the police at higher ranks arguably bring a wealth of new perspectives and leadership experience to the role. Smith (2016) conducted interviews with the first cohort of men and women who joined the police at the rank of Superintendent in England and Wales. He found that the individuals within this role were highly committed to

## Origins, Features, and Reform of Police Culture

public service and used their experience from their previous non-police occupations to think about leadership in novel ways. For example, Smith (2016) noted that the recruits demonstrated a level of self-awareness not usually seen within the police, as well as high levels of emotional intelligence, and they were confident about questioning established practices. However, he also acknowledged that other police officers opposed the new career pathway and did not necessarily welcome Direct Entry colleagues, with the credibility of the latter being a point of critique. Moreover, the entrants demonstrated an awareness of police culture and how this may impact them as they became more embedded within the police. One interviewee stated, ‘Even after just a couple of months, I can feel the culture seeping into me, so after 18 months of training, will my ability to bring in new perspectives be diminished?’ (Smith 2016: 321).

#### **6. Experiential Learning and Reflexive Practice**

A recent trend within police education that aims to address cultural change is the adoption of experiential learning and reflexive practice. Much of the research exploring such approaches emanates from Norway. As Hoel and Barland (2019) have noted, experience-based learning is a method for the police to learn from past mistakes. In the aftermath of the 2011 terrorist attacks in Norway, there has been a renewed emphasis on experience-based learning within the police aimed at improving crisis management through training exercises and self-evaluations. Hoel and Barland (2019) conducted in-depth interviews with police staff from different ranks who were involved in incident management as part of their role. They have found much divergence between the ranks in understanding the term ‘experience-based learning’, indicating a cultural gap between officers based on role. Moreover, their empirical material demonstrates that officers advocated learning from *past* mistakes for the prevention of *future* mistakes. However, a key obstacle to experience-based learning stems from the dominance of professionalism—notably,

## Origins, Features, and Reform of Police Culture

the idea that the police should not make mistakes (Hoel and Barland 2019). If police organizations want to learn and improve, then they need to ‘normalize their view of human errors and incidents’ (413).

Similar empirical research has examined whether footage from body-worn video (BWV) can enhance experiential learning and encourage self-reflection in Norwegian police students. Phelps et al (2018) have found that BWV devices are particularly useful to stimulate critical reflection among police students, leading to marked differences in experiential learning outcomes. Students have reported learning about the importance of enhanced communication and ethical decision-making, and the reflection was most compelling when they identified mistakes in their own performance (Phelps et al 2018). Similar work in South Africa by Marks et al (2017) has also encouraged officers to critically reflect upon their work with drug addicts. The officers in that study were invited to join groups of academic researchers in focused efforts to reflect upon policing practices. While the broader organizational emphasis was on arresting people involved in local drugs markets, the ideas drawn up by officers in reflective spaces were more in tandem with harm-reduction and human rights approaches towards drug users than with punitive and enforcement-led interventions (Marks et al 2017).

An allied debate is the trend towards better educated police recruits, with a particular focus on whether officers who hold university degrees can (re)shape police culture. Enhancing the educational background of police—both by recruiting those with tertiary education and by enabling officers to study whilst in post—has been praised as a positive development, since it alters the profile of policing and breaks down its institutional isolationism (Punch 2007). In their observational study of policing in the United States, Rydberg and Terrill (2010) examined the outcome of officer education on three key aspects of decision-making: arrest, search, and use of

force. They have found that while higher education did not have any meaningful impact on whether officers arrested or searched citizens, it significantly reduced the use of force during encounters. The authors have provided tentative thoughts on why this may be the case:

Unlike arrests or searches, the use of force is not inherently an end to the encounter but primarily a very different phenomenon. Force may be used throughout encounters as a means to controlling the behavior of suspects. [...] In any given encounter, police officers are permitted to use force if they feel it would be appropriate. [...] In one sense then, as opposed to the decision to arrest or search, there is more room for officer education to have an impact on discretion with respect to force (Rydberg and Terrill 2010: 111).

While further empirical research is needed to more fully explore the influence of higher education on police culture and officer behaviour, there are indications that it can lead to enhanced communication skills and judgement (Paterson 2011; Ramshaw and Soppitt 2018).

### **7. Change from Within: Concluding Thoughts**

This section has explored a number of key attempts, broadly generated from within police organizations, to change police culture. The research outlined above has demonstrated a mixed picture of both success and failure, and more often than not, these two extremes coexist. Some familiar facets of traditional concepts of police culture are resilient, while other aspects are now better understood in novel ways.

Police officers and the organizations they are part of are not insulated from broader political, social, cultural, and economic contexts. The work of Janet Chan in the 1990s rebooted debate about the possibility of changing police culture. Drawing on Bourdieu's (1990) theory of culture and practice, as well as on the work of organizational theorists such as Sackmann (1991) and Schein (1985), Chan (1997) reaffirmed the importance of examining the interactions between the 'field' (the wider organizational, historical, legal, socio-economic, and political conditions of police work) and the 'habitus' (the informal norms and values of officers). For Chan, police culture arises from the intrinsic relationship between the field and the habitus, such

## Origins, Features, and Reform of Police Culture

that when transformations in the field of policing are not accompanied by changes in the habitus, real reform will remain limited (Chan 1997). For her, the social, political, and legislative contexts must also be ripe for meaningful police change to occur. Her study of attempts by New South Wales Police in Australia to reform endemic corruption and racism has indicated that external pressures can have some success in changing police culture. The next section of the report examines some of these key external pressures for reform of police culture.

## **V. Changing Police Culture: External Challenges**

In recent decades, police culture has increasingly been a topic of public scrutiny and professional debate beyond academia. External events and key moments in policing history that make their way into the public consciousness have the potential to prompt changes in policing and its culture. Some of these external forces are discussed below.

### **1. Scandals and Public Inquiries**

Scandals involving controversial events, practices, and behaviours that reflect adversely on the police have featured consistently in the development and operation of public policing at both domestic and international levels. In the wake of scandals, police leaders and politicians face a surge in moral taint and find that legitimacy and reputation are valuable and fragile resources. Mawby (2017) has proposed a model of police scandal as ‘a form of individual or organizational failure that possesses four attributes: (1) transgression; (2) publicization; (3) response; and (4) judgement’ (233). If a scandal is elevated to a public inquiry, the police organization is often required to implement a program of reform intended to shape its future direction and culture (Rowe 2009). One uncertainty revolves around the question of whether the changes deliberately brought in to alter the most negative manifestations of police culture are likely to prompt only superficial change, a point I return to in the conclusion.

## Origins, Features, and Reform of Police Culture

One notable example of a high-profile police scandal with far-reaching consequences involved police racism in the UK. The murder of Stephen Lawrence in 1993 and the subsequent inquiry into police institutional racism are widely regarded as a catalyst in terms of police relations with racialized and ethnically diverse communities in Britain. While it is difficult to assess the impact of the resulting Macpherson Report (1999) in terms of improving trust in the police, it undoubtedly led to an ambitious and sustained program of police reform. Over 70 recommendations were put forward by Sir William Macpherson, centring around enhancing openness, improving accountability, and restoring public confidence. Key recommendations included: vigorous and more independent inspection of police forces; enhanced representation of people from racially and ethnically diverse backgrounds on local Police Authorities; the requirement that racist incidents and crimes that come to the attention of police are properly recorded; and the establishment of Hate Crime Units within police organizations; enhanced procedures for investigation of racist crimes and immediate review and revision of racism awareness training within police services to ensure improved services to victims and witnesses of racist crimes and their families; and closer monitoring of stop-and-search practices.

Some recommendations from the Macpherson Report appear to have been successful, including a reduction in overt expressions of racism and improvements in recording and investigating hate crime in Britain (Foster et al 2005). Due to the heightened political status of minority ethnic groups, I found that many police officers had accusations of racism at the forefront of their minds in the aftermath of the Stephen Lawrence murder and had begun to revise the way they dealt with people from racially and ethnically diverse backgrounds (Loftus 2009). In particular, some officers avoided initiating any proactive encounters with such groups for fear of recrimination from the police organization. These changes can be explained by the

## Origins, Features, and Reform of Police Culture

following factors. The British policing landscape had been transformed following high-profile, official criticism of the way ethnically and socially diverse groups are policed. Policing agendas insisted that officers afford better regard and treatment to people who have previously not been equitably served by policing. The rank and file were acutely aware of the policing demands and were alert to the fact that their behaviour is closely monitored. In other words, the police in my study had to change their (public) behaviour. But while the occupational culture had accommodated aspects of the revised policing terrain, it provoked resentment towards this group. There was a pervasive discourse that racially and ethnically diverse people deliberately exploited their race and ethnicity in order to rebuff officers and policing more generally (Loftus 2009).

The policing of intimate partner and gender-based violence has also been high on the political and public agenda, with governments publishing national strategies both to scrutinize and guide police responses in this area. Carillo (2021) has suggested that there has been considerable improvement in policing since the 1980s in terms of training, attitudes, responses, legislation, and support for victims. Officers are significantly more aware of pro-arrest policies, although they continue to exercise much discretion at the scene (Myhill 2019). The abduction, rape, and murder of Sarah Everard by British police officer Wayne Couzens in 2021 has brought to the fore the acceptance and reproduction of misogyny within police culture, with a public inquiry announced by the Home Secretary in November 2021 (Home Office 2021). The ongoing UK Undercover Policing Inquiry (UCPI) similarly explores the morally troubling culture of covert operatives with respect to gender (see UCPI 2015).<sup>7</sup> Central to the inquiry is the accusation that undercover officers deceived women, some of whom they were monitoring, into

---

<sup>7</sup> For further information, see the UCPI website, <https://www.ucpi.org.uk/> (accessed 25 March 2022).

sexual relationships. Recommendations from the UCPI are expected to target the secretive culture of undercover policing.

Another relevant case study of how major reform is secured via external pressure is the controversy surrounding police stop-and-search practices in Scotland. This was set in motion by a report demonstrating an extensive use of stop-and-search powers far above recorded levels in the comparable contexts of England and Wales (Murray 2014). Moreover, these powers were disproportionately deployed against children and young people and often without legal authority or reasonable suspicion (Murray 2014). Intense scrutiny of Police Scotland followed, with a national scandal that brought into sharp focus broader questions of democratic, citizen-focused policing (Murray and Harkin 2017). The critique of stop-and-search in Scotland led to major legal and policy reform, largely in the hope that these would prompt cultural change on the ground. As Aston et al (2021) have explained, one of the key initiatives was a six-month pilot in the Fife Division that sought to improve stop-and-search recordkeeping, enhance accountability, and restore public confidence. However, whilst police officers did begin to systematically record their stop-and-search encounters, young people continued to be disproportionately targeted—and often without a statutory basis (Aston et al 2021). Thus, the pilot amounted to ‘marginal rather than meaningful organizational change’ (46). Several explanations have been put forward by Aston et al (2021) to account for the failure of the reform efforts. First, senior leaders within Police Scotland appear to lack a genuine commitment to change, perhaps even introducing the pilot as a presentational front in order to rebuke public critique. Second, the stop-and-search tactic is still considered to be a core and essential aspect of police work and continues to be communicated to frontline officers as such. Finally, senior police leaders have demonstrated

## Origins, Features, and Reform of Police Culture

skepticism, suggesting that the public concern has been exaggerated in media and political discourse. Aston et al (2021: 49) have explained:

[T]he Fife pilot failed to change officers' cultural knowledge or habitus (Chan 1997), despite ongoing changes in the wider policing field. Police managers were themselves unconvinced by the need for reform; nor was the change implemented in a consultative way, thus precluding two-way communication or fair internal procedures. Without clear senior support, officers were unable to see the pilot as just and fair, or to build it into their occupational identity (Bradford and Quinton 2014).

Aston et al have concluded that real change in police practice and culture requires effective leadership and a strong commitment to organizational justice. The latter emphasizes the need to reorient the police organization to be seen by its own officers as having fair and just procedures, as operating in a transparent way, as having consistent and clear decision-making, and as embedding respectful personal interactions and employing reciprocal and collaborative communication methods (Bradford and Quinton 2014).

## **2. Civilian Police Boards and External Oversight Bodies Investigating Misconduct**

Efforts to professionalize law enforcement and to monitor the behaviour of officers, increasing demands for transparency, and the findings of independent police inquiries have recently coalesced in the establishment of external police oversight boards. Civilian oversight is a form of accountability and an example of democratic policing whereby police departments are directly influenced by or required to be responsive to external bodies.

As Helme (2015) has explained, Police Boards are the first layer of civilian oversight in Canada. Police Boards of civilians, typically comprising between seven and nine non-police civilians, are responsible for appointing key members of the police force (notably the Chief) and regulate the police force without interfering with daily operations. As Helme has noted, the choice of the Chief Constable is influential in deciding the overall management style and culture of an organization; for instance, whether it is a community-oriented organization or a more

## Origins, Features, and Reform of Police Culture

insular and defensive one (Helme 2015). Police Boards are actively involved in strategic planning and the governance of police organizations, although these two functions can be a source of tension. The attitude of the police towards Police Boards exercising their civilian oversight responsibilities are often ‘less than enthusiastic’ (Helme 2015: 16). The main complaint by the police is that Police Boards should not be involved in any matters relating to operations, and they have been known to exclude civilian governors from important police decisions. The Morden Inquiry, set up to examine the police handling of the G-20 demonstrations in Toronto in 2010, discussed the tense relationship between the police and Police Board, finding that the latter had been excluded from important planning decisions (Morden 2012; Helme 2015). Likewise, according to Helme:

Morden also concluded that the ‘timidity’ of the Police Board, due to its fear of offending the police by inquiring into what the police insisted was their exclusive ‘operational’ jurisdiction, led to a complete failure on the part of the Police Board to do what it was mandated to do, that is to conduct effective governance and civilian oversight of the police (Helme 2015: 17).

These discussions point to a cultural resistance within the police to civilian Police Boards. It is recognized that civilian oversight boards can interrupt existing norms and practices within police organizations because by embedding members of the public into the workings of police organizations, the logics of boards are inconsistent with certain characteristics of police culture.

Headley has suggested:

Civilian review boards may disrupt traditional police culture, which is characterized by distrust towards and isolation from citizens, a desire to ‘maintain the edge’ in encounters with citizens, a crime-fighting orientation, a desire to avoid supervisor scrutiny, loyalty to fellow police officers, concerns about danger and bravery, and permissiveness towards misconduct (Headley 2021: 8).

Another layer of civilian oversight relates to the handling of police misconduct. In the Canadian context, the Police Complaints Commissioner, Independent Investigations Office, and similar models have emerged largely as a response to previous systems of internal handling of complaints (Hope 2021). It has been shown that internal police investigations of public

## Origins, Features, and Reform of Police Culture

complaints—in other words, cases of the police investigating the police—have long been perceived as biased and contrived (Landau 1996). As a result, newer and hybrid systems of civilian oversight have emerged as a solution for enhancing the level of accountability in processing complaints and restoring public confidence in the police. As Murphy and McKenna (2014) have noted, while one model champions an entirely independent approach to the receipt, investigation, and response to public complaints of police misconduct, the other advances a ‘team’ concept that includes police investigators working with civilian counterparts to interview, interrogate, and investigate public complaints. Both models are in operation within the Canadian context, with many reported advantages and disadvantages. For instance, Murphy and McKenna (2014) have noted that a core advantage of the civilians-investigating-the-police model is that the absence of police experience—and therefore the influence of police culture—can be regarded by the public as the most independent way to respond to complaints about police misconduct. However, this lack of police experience and legitimacy (in the eyes of the police) can diminish police cooperation and participation, resulting in unsuccessful investigations.

Recent empirical research conducted by Stelkia (2020) in Canada also underlines police resistance towards external forms of civilian oversight, with complaints revolving around the perceived inability of civilians to properly comprehend the scenarios and risks that officers face and the on-the-spot decisions they have to make in the course of their duty. These kinds of grievances resonate with the proverbial ‘us’ versus ‘them’ mentality that has been found in ethnographic studies of police culture (Holdaway 1983; Loftus 2009; Reiner 2010).

The relevance of police culture in these debates relates to the idea that it has a tendency towards isolationism and defensiveness that can inhibit equitable and impartial investigations by the police when faced with civilian complaints. Murphy and McKenna (2014) have suggested

that successful external review processes must acknowledge police concerns and find ways to meaningfully involve police in the processes of review, investigation, and reform.

### **3. Technology-facilitated Interventions**

New technological capacities for citizen surveillance of everyday policing may increase police accountability and have implications for police culture. An emerging body of research demonstrates that police officers today work in pervasive ‘techno-social’ environments in which their deviant behaviour can be captured on video—notably through widespread ownership of smart phones—and shared instantaneously with global audiences via social media (Brown 2016). The graphic and widely circulated images of George Floyd’s murder in 2020 by a white Minneapolis officer most poignantly illustrates this point. Police actions that were once private and backstage are now front of stage and on public display. Goldsmith (2010) has described the increasing surveillance of police activities through public technologies such as smart phones as the ‘new visibility’ of policing. This means that the police themselves are increasingly being monitored by the public, making it even harder to control the narrative and protect themselves from public criticism and official review.

There is evidence to suggest that these new policing realities can infiltrate and profoundly reshape the thoughts and behaviour of officers in the course of their duties. Pioneering research by Brown (2016) undertaken in Ottawa and Toronto has found that the heightened visibility and increased informal oversight of police actions have impacted operational policing in two significant ways. First, it serves as a ‘disciplining influence’ in the occupational consciousness of most officers (Brown 2016). Second, police officers’ awareness of their enhanced visibility has led to substantial moderation in when and how they use coercive force (Brown 2016). Thus, the

## Origins, Features, and Reform of Police Culture

increased exposure to surveillance by ordinary civilians can alter police culture and the conduct of individual officers.

An allied debate concerns the expansive adoption of body-worn cameras (BWCs) by police organizations around the world (Ariel et al 2017). The motivations underpinning the move towards BWC implementation are varied, ranging from a desire to reduce illegitimate use of force and unduly malicious complaints against officers to increasing the accountability of the police and to improve evidence collection to secure convictions (Laming 2019). Study in this area focuses to a large degree on the various ways in which BWC have impacted on police use of force, while less is known on this development for other aspects of police culture. However, research emanating from Australia has shown that BWCs are routinely deployed during intimate partner and gender-based violence incidents, with officers working within specialist family violence roles acknowledging the benefits of the technology for both the police and victims (Iliadis et al 2021).

#### **4. External Pressures for Change: Concluding Thoughts**

In this section, I have discussed how key events and pressures that are external to police organizations may set in motion and potentially influence changes in police culture. There are reasons to be both optimistic and pessimistic about developments in policing. In the decades since the seminal ethnographic studies of the police, additional research has revealed and outlined a set of *central* and *marginal* features of police culture, noting newness and difference alongside old and persistent themes. Researchers from different jurisdictions have demonstrated that aspects of police culture are in transition and can respond positively to change. One sticking point, however, is the question of whether changes deliberately brought in to alter the most negative manifestations of police culture are likely to prompt change at only superficial rather

than entrenched levels. As Marks (2005) has argued, meaningful police transformation must encompass not only structural and behavioural changes but also *attitudinal* shifts. Top-down and hard-line policy reform is likely to be insufficient and resisted. However, when rank-and-file officers are centrally and democratically involved in change processes, there can be a measure of success (Marks and Sklansky 2008). Others have argued that institutional reform is likely to emerge only generationally, as new cohorts enter the occupation from societies that are also undergoing cultural change (Campeau 2015).

## VI. Conclusion and Reflections

This report set out to identify and examine key research conclusions emanating from the extensive literature on police culture, as well as the efforts implemented to encourage change in police organizations and on the ground. Part I of the report discussed the important role played by the police in society. It was noted that police are arguably the most important provider of citizen safety. However, when officers respond inadequately to calls for assistance or abuse their powers, they profoundly undermine citizen security and well-being. Part II explained the value of ethnography for unearthing, documenting, and understanding police culture. As a methodological approach, ethnography has proven unparalleled for examining the informal working rules, tacit understandings, and underlying assumptions that sustain and motivate the police. Part III of the report turned its attention to the central concept of police culture. It identified what have been characterized as core features of police culture over time and in different settings, providing a thematic discussion of the central characteristics observed within the culture. This section also discussed key critiques of the concept, drawing on research that challenges the existence of an inflexible and wholly negative police culture. Part IV and Part V identified a number of strategies—both by police services and as a result of external pressures—

## Origins, Features, and Reform of Police Culture

to change aspects of police culture. These discussions sought to note the possible reasons for the success and failures of these strategies, particularly with respect to family violence, gender-based violence, and the provision of equitable policing services to racialized groups.

The central suggestion in debates about police culture is that police organizations are characterized by informal principles that guide and influence day-to-day police work. However, it nevertheless seems that a misleading and perhaps unjustifiable stereotype has emerged within the literature on police culture. It is doubtful that police forces are as homogenous as has been inferred, and occupational socialization is not an overwhelming source of negative influence (Paoline 2020).

Yet there is sufficient evidence from research and inquiries to conclude that police services in different countries have been characterized by at least *some* of the qualities captured by the term, and as a result, a key implication is that changes are needed to elements of the police culture(s). Achieving comprehensive change may be particularly difficult given the prevailing influence of the task environment. The police remain in the unique position of enforcing laws in liberal democracies and are expected to police the symptoms of fractured communities. In other words, the basic challenges of police work, identified by Skolnick (1966) all those years ago, persist. Police reform may encompass a conflict between government directives, organizational policy, and structural changes on the one hand, and informal cultural factors on the other. There may also be a mismatch in values, outlooks, and priorities between frontline officers operating at the base of the organizational hierarchy and senior officers in management positions. These tensions are likely to be compounded if reform is imposed from above without the participation and consultation of the front line—a common occurrence after scandal and formal or public

## Origins, Features, and Reform of Police Culture

critique. Disciplinary regimes may increase a sense of aggrievement by officers, further alienating them from their superiors and possibly the public (Paoline 2020).

However, progressive and more democratic forms of leadership, changes to the expected police role, the presence of civilian oversight, and external scrutiny may all have a role to play. Encouraging police organizations that allow for learning and self-reflection, particularly with a view to learning from past experiences, offers potential to improve police processes and practices. Altering recruitment patterns cannot be the definitive answer to changing police culture, but such efforts have the potential to breakdown the relative uniformity of the traditional police force composition. Officers from socially, culturally, and educationally diverse backgrounds may be less susceptible to police acculturation processes, pursue less confrontational approaches during interactions, and buy into victim-centred and community-focused philosophies. Importantly, a combination of political commitment and external pressure is also required to overcome internal police resistance to change (Chan 1997).

Although researchers have made and continue to make significant contributions to understandings of policing and its cultures in Canada, ethnographies within specifically Canadian contexts remain uncommon. There is a particular absence of ethnographies of the RCMP. In this report, I have noted several gaps in research that could be explored to provide additional insight into the police culture debate in Canadian communities. Future research could aim to: understand the appeal amongst officers and the public of the symbols and iconography associated with police work; explore how the past lives and prior socialization of people who join the police interact with and potentially reshapes police culture; and provide empirical insights into transformative leadership within policing and the role of rank-and-file officers who are invited to be involved in reform processes. Establishing partnerships and creating

## Origins, Features, and Reform of Police Culture

opportunities for collaboration and knowledge-exchange between academic researchers and police practitioners to pursue lines of inquiry of mutual interest can potentially lead to new insights for the benefit of policing.

## **Executive Summary**

This report investigates the health and safety of survival sex workers in the Halifax Regional Municipality (HRM) and in rural areas of the province by examining 1) how sex workers experience community safety in Nova Scotia; 2) how they ensure their own safety; and 3) their relations with community agencies such as the police, the health care system, and other community service providers. Our investigation also looks at barriers to reporting victimization, including distrust of the provincial health care system and distrust of the police. Throughout, this report centres and addresses the experiences of sex workers who are marginalized due to Indigeneity, racialization, because they are 2SLGBTQ+ (or engage in sexual activity with 2SLGBTQ+), or for other reasons.

## **Method**

We have used a snowball method of selecting participants, starting with agencies and contacts known to us from previous research of this type. Those first contacts have given us others, to whom we gradually reached out after our initial interviews. The benefit of using this method is that it is often easier to begin with people one knows who are working within the community, especially if one has worked with them previously in some capacity. It reinforces trust of the interview process and reinforces the trajectory of the work, assisting in the reaching out to others in similar community positions or in gauging the trust of one community group with another by virtue of recommendation and referral.

The ratio of our interview inquiries to actual interviews was fairly good: in the HRM, we reached out to sixteen agencies, and eleven responded, while the rest declined or did not respond. For the rural interviews, we reached out to nine agencies, with seven responses. We interviewed a total of nineteen participants from urban and rural settings: twelve from the HRM, six in areas including and surrounding Truro, and one source from Cape Breton Island. These nineteen participants work directly with ten service agencies in the HRM community and seven in rural areas. These participants encounter sex workers and assist them in varying ways, such as with health services, clothing, food, essential supplies, shelter, and/or providing a chance to unburden.

Interview participants in direct contact with sex workers gave us the richest data, while those who work more indirectly with sex workers gave a depth of context, as they tend to compare sex

workers with other marginalized populations based on race, sexual identity, or shared precarity. The snowball method can make it easy to “go down a rabbit hole” on one narrow aspect of an issue, in a direction not intended initially. However, as is often the case with this type of research, some of the most unexpected interviews gave us valuable context and insight.

We have categorized our findings in terms of the issues conveyed to us by our participants working with sex workers in the field: stigma, precarious housing, poverty, addictions, mental health, barriers to healthcare, violence (from clients, pimps, and/or police, and including the intense specific threats to Black, Trans, and Indigenous workers), reporting hesitancy, and how sex workers attempt to ensure their own safety.

### Challenges

We encountered a number of difficulties in garnering interviews in the time frame requested, including the effects of the Omicron variant of Covid in the community as we moved into December 2021 and January 2022. Many agencies switched to emergency-only services, telephone contact, or reduced hours. Some health care services reduced laboratory testing.<sup>1</sup> In addition, the weather, a perennial Canadian problem, was especially difficult here in Nova Scotia during the same time period, often resulting in at least two storms a week and interrupted power supply. All of these challenges slowed the process of data collection, while also reminding us just how precarious our population of study truly is, particularly those who live in tents in an ocean-bordered city in winter.<sup>2</sup>

These factors precluded a deeper look into rural areas in the first round of interviews, although we considered it necessary as many of the worst stories of violence that were reported to us occurred outside of the HRM. In addition, we note that the level of service provision for women in rural areas in general is not as deep or as systemic as that which occurs in the HRM.

---

<sup>1</sup> CBC reported that “STI testing in the city would resume, as it had been suspended for the months of December and January because of the effects of Omicron overload on all laboratory work in the city. STI testing would happen at the Halifax Sexual Health Clinic and other walk-in clinics as appropriate in the city” (CBC Radio One, 4 Feb 2022).

<sup>2</sup> CBC reported that “City workers were checking tent cities for hypothermia victims after last night’s storm” (CBC Radio One, 4 Feb 2022).

In the second phase of the research interviews, we focused on the rural town of Truro and its environs.<sup>3</sup> We discovered that participants in the rural areas were hesitant to talk with us, some wanted to discuss it first, others checked with their agency lawyers (one or two in the HRM did the same), and one flatly declined, citing a mistrust of the Mass Casualty Commission (MCC) and of the media, chiding us for not talking directly to sex workers for this study.<sup>4</sup>

We concluded that overall hesitancy among participants in rural areas could be a result of “mistrust” of us—two interviewers who were perceived to be from the “city” and therefore do not “know” rural issues. Another factor we noted is that domestic violence as a pattern of abuse is very public and present in the local news cycle at this time, largely as a result of the public status of the Commission inquiries and interviews. Domestic violence is similar in character to sexual/sexualized violence generally, as some of these rural participants have concluded, but the stigma around sex work makes the linkages between the two issues difficult. In addition, discretion is treated as sacrosanct by non-profit workers dealing with clients who have experienced violence, regardless of source (partner or client), so speaking about it to two “experts” they do not know can be quite difficult, particularly while the topic is seen as newsworthy. Further, Portapique is a community very physically proximate to Truro. Some residents of Truro lost family members or close friends as a result of the mass casualty event; many still feel the impact directly. The level of mistrust of the Commission by members of the victims’ families was echoed by some of interviewees, but more importantly, mistrust of the media is also quite high. In our estimation, this last factor may have been the most relevant reason for reluctance.

### **The Ideological Similarities and Differences of Interviewees**

Community non-profit workers, social service workers, and health providers that we interviewed understood the complexity of the issue of sex worker safety. They were quick to argue in defence of sex workers for both their acts of desperation and acts of ingenuity in the face of incredible

---

<sup>3</sup> We included one interview with an agency in Halifax that works with both rural as well as urban women, as well as one interview with an agency in Cape Breton, in order to contrast what we found with another rural region in the province. One agency works with sexual assault survivors, the other primarily with domestic violence survivors. Both have experience with sex workers.

<sup>4</sup> The timeframe of this project precluded interviewing sex workers directly, as access is dependent on trust and community-building, and any study done in a short period of time (e.g., under six months) would jeopardize both.

odds. Interviews that focused on desperation were focused more often on the lived experience of sex workers with few resources, possible addictions, living precariously and at great risk.

We found that some interviewees claimed consistently homogenous backgrounds for sex workers, such as addiction, child-abuse, neglect/poverty—which resemble the “victim” narrative sometimes used to describe sex worker backgrounds. Other interviews mentioned survival ingenuity on behalf of sex workers and were respectful of the lengths to which sex workers would “protect” themselves. For example, some sex workers would release certain but not all information about their health status, and most guard their work status with discretion due to the stigma of sex work and/or the possibility of violence.

All of our participants were protective of sex workers/clients in their own ways but treated that protection differently; for example, some interpreted “loyalty” to sex workers/their clients by not having any relationship whatsoever with police, whereas others worked directly with the police on stopping the exploitation of sex workers. However, all interviewees conveyed a nuanced awareness of the circumstances of survival sex workers in a coastal city that borders the Atlantic Ocean in winter, with limited access to housing and a strong shame-based stigma particularly regarding Black, Indigenous, Trans or other 2SLGBTQ workers. Further, those interviewees who worked in rural Nova Scotia were particularly conscious of rural inaccessibility to services, which exacerbated not only the usual ramifications of sex work stigma but also the precarity of living in a rural and potentially isolated area when violence is experienced.

## Introduction

We define survival sex workers as persons who work the streets for clients or, in rural areas, gain clients cautiously through contacts. Some survival sex workers are addicted to illicit substances. Indoor sex workers and those who are not facing addictions have far safer working conditions than survival sex workers.<sup>5</sup> One health care worker we interviewed insisted that sex workers themselves do not describe what they do as “work” and asserted that they operate on primary-needs motivation, as opposed to what the word “work” infers.

More than “higher-end” sex workers who may conduct their work with cameras or via internet sites that they own, survival sex workers are at the most marginalized edges of sex work due to the precarity of their housing, possible substance abuse, and poverty. They are much more likely to incur violence while working due to many factors, such as in-person contact with clients and with potential clients, the lack of protection street work offers, risk of exposure to the elements, and the risk of exposure to the police. Further, the Covid pandemic has increased the precarity of survival sex workers in many ways since its onset. The health care system has been overwhelmed; routine lab tests and the ability to access ER services have been compromised; housing has become even more precarious due to the poverty of survival sex worker and the housing crisis in Halifax has intensified for the working poor and the unhoused. We found the housing crisis even more significant for rural areas, because the lack of public transportation exacerbates all of these problems. For these reasons, the current situation of survival sex workers in Nova Scotia is dire, as illustrated repeatedly by our interview findings.<sup>6</sup>

*Sex worker safety is nonexistent, there is no safety measures for sex workers. It's been “grandfathered down” not to trust the police. [Our agency] also recently did a survey, and it showed that there was more violence from a police officer than of a perpetrator. (5)*

---

<sup>5</sup> Two separate non-profit health agencies we interviewed indicated that such “higher-end” sex workers are not in need of repeated STI testing or other routine visits to health care as their work is far safer than the street sex workers.

<sup>6</sup> All of our respondents are identified by number rather than specifically identified, even by occupation, for anonymity purposes. In order to get interviews, we had to guarantee absolute anonymity for some (others weren't as concerned). However, to name some is to limit the pool and encourage ‘guessing’ for the others. To remedy this, we decided upon numbering. If from a rural area, the designation Rural will accompany the number. All audio tapes will be erased once this report is finalized. The occupation of many of these interviewees ranges from EDs of nonprofits, to community health, housing, addiction, violence or mental health outreach workers.

This report aims to shed light on this severe lack of safety for survival sex workers, which was a recurring theme in the responses of our interviewees. Specifically, we look at housing and poverty for survival sex workers, addictions and mental health as contributory factors in the lived reality for the most marginalized of sex workers, that is, those who work on the street. We examine barriers to healthcare in the formal health care system (specifically the emergency departments of hospitals) as a direct impact of stigma. We then report on violence against sex workers specifically.

Our findings point to two factors that contribute to violence: stigma and the fact that sex workers are still considered to be criminalized, as most of the abuse we document herein is directed at them, not at their clients, for whom participation IS criminalized, i.e., in Canada, it is illegal to buy sex, not to sell sex. There appear to be connections between these key factors and reporting hesitancy—that is, the reluctance or refusal to report violence, especially formally to the police and health care systems. This report looks at how sex workers, in the face of strong stigma and criminalization, instead attempt to ensure their own safety. We conclude by noting some positive trends in HRM and by proposing eight Recommendations, which have come from a synthesis of interviews and the literature we reviewed.

## II. Stigma

*There's such a long history of sex workers being on the margins and being treated like whores and sluts and with no value whatsoever. And that long, long history still pervades people's perceptions of who sex workers are and what sex work is, and I think that those common perceptions run throughout all our systems, not only just our personal kind of feelings about it, but I think they run through the justice system, the police services (6).*

Stigma is exhibited at just about every level of encounter for a sex worker. The repercussions of stigma range from a complete misunderstanding of the life of a sex worker at best to abusive treatment at worst. While it is too simplistic to assert that stigma is the driving force behind the poor treatment of sex workers by larger systems, stigma is undoubtedly real in its consequences (Armstrong 2019; Benoit et al 2018; McCausland et al 2022; Treaolar 2021; Ralston 2021).

*What does stigma do? I mean it keeps people in the shadows, it keeps people from coming forward and asking for help.... We don't respect sex work as legitimate work, we know that people use their bodies in all kinds of ways that we don't respect.... People judge sex a lot, and the more you can dehumanize someone, and the more you can deny them basic services, you can deny their social status and respect and rights and a whole bunch of*

*other stuff. ... It's rooted in capitalism and colonialism and misogyny and all of those big, big things. (11)*

*I think every one of our institutions [stigmatize], our schools do, our top protection agencies do, our courts and our criminal justice system... it's not just the police. They're not the first people to treat them this way. This is how they experienced school, how they experienced the grocery stores, their whole life, you know, with their families. It's how they've experienced, you know, every institution they've ever been involved with. (3)*

Stigma, as evident in the negative treatment of the stigmatized by others (Link and Phelan 2001), in the self-perception of those who are stigmatized (Benoit et al 2020), and in the level of violence perpetrated against survival sex workers (McBride et al 2021), reveals an underlying belief that the objects of stigma are disposable as people.

*I think a lot of people still don't understand what somebody engaged in sex work (goes through), what that means or what it could mean or what a trafficked woman is or what they could be like (afterwards), how somebody could be. So, I find that the real safety issue is that people are just extremely unaware. (Rural 5)*

*There's still sort of a reluctance to talk about [sex work] [because of] the legal aspect and also shame, like a lot of shame tied up in that. ... You know it's interesting when I heard the word(s) "sex worker". Most of the patients that I have, I don't think anyone would really identify themselves as a sex worker. I think oftentimes people engage in sex work as a means to an end, but I don't think anyone you know at least in the context of visits with me, people are really identifying themselves as sex workers so much as people who have needs that need to be met and sex work is certainly a way to get some of those needs met. (10)*

*I do live in a small community in rural Nova Scotia, and everybody knows everybody. So for me to access supports specific to something that is stigmatized, whether it's sex work or whether it's you know, having experienced abuse or having experienced addictions or having experienced mental health, challenges, all of those come with a lack of anonymity that you would get in the city. ... If I'm walking into the one agency in rural Nova Scotia, small town X that supports folks with this experience, everybody knows why I'm going there. (Rural 4)*

The stigma, shame, and discrimination that criminalized activity (Bruckhert & Hannem 2013) brings perpetuates stereotypes about those who are sex workers (Benoit et al 2018). Even though federal law now criminalizes procurement and client access, it remains the case that it is the sex workers who experience the preponderance of shame and stigma (Raguparan 2018). Moreover, stigma is also uneven (Tyler and Slater 2018), with Black (Brooks 2021; Comte 2014; Durisin & van der Meulen 2021), Indigenous (Raguparan 2017), Trans (Baumann et al 2018; Eddo-Lodge 2018; Comte 2014) and/or poor survival sex workers encountering the greater weight of the burden.

*So, for individuals who grow up on reservation land, in this the growing urban population of First Nations people (this is what happens). So they go (to the city) for economic opportunities, they may end up in the trade and then would have a difficult time coming back home to a rural community where they can't live the same life without everyone knowing and that's the small town way. You can't walk the streets because you're going to get recognized, you can't sit in cars cause somebody's gonna see you and you can't go too much online cause people will see that too. So, with a rural community, everybody likes to run the gossip mill. ... Maybe [you're] just not feeling like you can go back home or just that everyone in the community is going to know because they are quite tight knit and usually [...] everyone has a connection with somebody. (Rural 2)*

*So number one, they're a woman... If a Trans woman, there's number two, because you're identifying as a woman who is already discriminated against just for being a woman, but now you're a Trans woman so you're adding not only the Trans but woman and then if you're Indigenous, then you're adding something else. So the discrimination level keeps getting higher and higher and higher every time you add something to that. Then if you are a (Trans) woman who's in the sex trade, like that adds another level. If you are even not in the sex trade, but maybe you are someone who's on social assistance, there's another level. (Rural 7)*

### III. Housing, Poverty, Addictions, and Mental Health

#### 1. Housing and Poverty

The housing shortage is at a crisis level in Halifax (Nourpanah 2021), mainly due to an influx of people from other parts of Canada and elsewhere who knew of the initially favourable statistics in Covid spread in Nova Scotia. Real estate agents saw this market as a good one to make money, making even more money as housing prices climbed. In a parallel fashion, rental housing has been converted to Airbnb and condo prices have soared. Demand is still high for homes throughout the province, but most especially in the HRM.<sup>7</sup> Further, the population of the HRM has increased dramatically during the Covid pandemic (Mason 2021). CBC indicated that Halifax is the fastest growing city in Canada (Berman 2021; Thomson 2021), which has led to increased housing shortages for those at the bottom of the financial scale, which is where survival sex workers exist:

*I'm using one example. After this individual pays all their bills from their income assistance, they're left with \$60.00 a month, so they're like, what do I do [for] food or anything? This amount for rent has just gone up, but before that I think it was like \$535 whatever it was, for a long time. (1)*

<sup>7</sup> In a CBC interview with the Minister of Housing regarding the building of units, it was estimated that over 300 hotel stays worth about \$3 million have occurred since the pandemic began for the precariously housed (Cooke 2021). There are also reports that the housing crisis not only affects people of lower income but the economic middle-class as well (Woodbury 2021).

*I had more than one tell me that during Covid they've gone back to escorting or sex trade work because they lost their job that they were trying to [do]. I have one patient who had taken aesthetics and was trying to have an aesthetics business and then everything shut down, and she had no money, and she was like "I have to go back to escorting." (2)*

*I've talked to sex workers who maybe in the summertime they'll be homeless or maybe they'll be sleeping outside or walking around, but the in wintertime they'll just stay with their Johns or the people who are paying them that night. I think that's a big issue that is hard to [assess]. It's like hidden homelessness because you can't go out and say oh there's a tent, that means one person's there ... because these people are ... invisible. (9)*

Poverty, of course, is one of the main reasons for people ending up on the streets:

*So many people on the streets that I talk to come from just terrible situations. ... So many of them grew up in care, or if they didn't, they grew up in public housing or with a single family household, [implied crowding] and then their parents kicked them out and [they] got pregnant young. If we could just stop this intergenerational poverty of ... people growing up so, so poor... And the streets are just like "one down" for them: they barely grew up off the streets. (9)*

*I handed out a tent last week and we ran out of blankets, and I had to call a cab for her to go to .... the middle of the woods. This is where we're at in society, passing a tent to somebody to go pitch a tent in the middle of winter. And the only blanket I had was a \$2 [one]. It was my own because the office was cool. The only blanket we had in the office was a little fleece Ikea blanket and that's what we had to send her (with). That's all we had to give her. (12)*

One source from a housing organization indicated that the number of Indigenous homeless people they serve is highly disproportionate to the Indigenous population of the province. Similar stories were told of Black sex workers.

*Every six months or so we do a survey of people that we know are sleeping outside, and it's always like 20% of people outside identify as Indigenous. I feel like it's not so grossly overrepresented when it comes to the African Nova Scotian population. I think there's probably more people who are homeless that identify as African Nova Scotian, compared to the overall population, but it's not ridiculous. [But in] the case of Indigenous people, it's like 4% of Nova Scotia is Indigenous, but like 20 or 25% of the people who are homeless are Indigenous. (9)*

*I unfortunately would have to say the Indigenous community and I would have to say the Black community... I just noticed that there's a lot more Black and Indigenous women on the strolls... so it could be a poverty thing. In society we know that [within] the Indigenous communities and the African Nova Scotians (many) do fall below the poverty line. (12)*

*It's very hard to get an apartment, and so the housing issue is definitely there, and a lot of landlords won't rent to somebody who's on income assistance. So people go around looking for apartments, and they won't [be permitted to rent it]. Quite a few hotels here do like a month to month, but they ask you to go down [for a viewing] in person. I know a lot of people that were just turned away because ... they didn't like how they looked. So there's a lot of judgement when it comes to housing for sure. (Rural 5)*

*We have a housing crisis, obviously it's everywhere. It's literally across the country, but here in our small little towns, some are still very racist here in Nova Scotia and will not rent to Indigenous people. We've talked to people over the phone, and they're like, yes, come... They're very friendly, [but then] you walk in the door, they see you as an Indigenous person, and then they're like, "well, yeah, you can still look around, but we actually just rented it." (Rural 7)*

Further, Trans sex workers face a much more difficult time getting safe and secure housing, as reported by many of our study's participants.

*Our Trans population often are a bit transient sometimes because (maybe) they aren't in safe living environments, and when they start to transition in those environments which aren't safe to begin with [it] can become more unsafe. That's one of our standard questions when we screen people for Trans care—their living arrangements. It's not a standard question for all patients, but [for] Trans patients, [we ask] what their living arrangements are, do you feel safe? Probably half of them would say they weren't in safe places and now they are because they made some changes ... or they're not. Transitioning is the hardest time for them really, because they're in between... [They are] coming out and having a lot of people that don't understand, especially family members that are just not comfortable with it [and] don't believe in being Trans. (2)*

## 2. Addictions and Mental Health

Addiction and mental health issues are very much intertwined (Puri et al. 2017). Poverty, lack of housing, and barriers to health care all contribute overwhelmingly to stress and thus to poor mental health outcomes. Many of our participants lamented the shortage of mental health care in Nova Scotia:

*There is no adequate mental health or addiction services in Nova Scotia, not even for people who are privileged and white and well off or who have family doctors and know how to navigate the system—not even for those people, so you can only imagine what people who are living on the margins have access to. It is so deplorable. The majority of people who are criminalized, the majority of people that I know in this community who are doing sex work, have a mental illness that is not treated, that there is no real attention paid to. There's nothing there, nothing available. (4)*

We did repeatedly hear from agencies that worked 8-4/9-5 that they wished they could afford services as some agencies do, in the evenings and on the weekends for their clients, as this could potentially decrease visits to emergency services for the stigmatized.

*Crack is really [a] big [problem] and the opiates [too]. It's getting worse, and I didn't think that that was possible. The detox centres ... most of them are daytime treatments. Once [clients] leave detox, there's not much for them to do to work on the addiction. So they spend that certain amount of time in detox and then they are left on their own. Private rehabs like the one I used to work at was \$9k for 28 days. And that's the cheaper side—it's considered a non-profit. So the ones that don't cost that much or that our government funded [such as] the Marguerite Centre [for women], they're always full. I don't feel that*

*our addictions programme is good at all. And mental health is even worse. If you don't have insurance to get a counsellor, forget it, or you're waiting a year. And crises don't happen [only between] 9–5. (12)*

*So they access emergency room services when they need help, and these two people I'm thinking of in particular are street-involved; they have mental health issues. In my experience with these two people, the hospital systems put up huge barriers; for example, when it's found out ... by hospital staff... that they are sex workers, there's a further stigmatization around using emergency services for health care. I've seen these people actually being refused services at the hospital; they can't help them anymore. They just will not provide them with services, and escort them off the premises. (6)*

#### **IV. Barriers to Health Care**

For survival sex workers, survival is the main objective, wherein the most basic needs such as food, warmth, and shelter take precedence over things such as treatment for chronic disease, especially if the latter requires ongoing attention, such as a series of appointments to get appropriate medications and refills. Interpreted another way, sex workers do not ignore their health (Overall 2016); instead, as described by Maslow's hierarchy of needs, their most basic priorities are to be able to breathe clean air, have access to water, food, shelter, sleep, and clothing (www.verywellmind.com). The needs of survival sex workers are even more acute than for other types of sex workers because of the immediacy of questions such as where you will sleep the next night, when the next meal might be, and (for those with addictions) how you will get your fix. These questions tend to preoccupy the daily lives and hour-to-hour actions of survival sex workers, and as a result, there is little to no time for them to think about their health beyond being cold, wet, hungry, in physical pain, or coping with severe physical or emotional trauma, disease, or overdose withdrawal. Living in the moment is the definition of survival.

Our findings show that living on the margins includes a variety of definitions of health (Platt et al. 2018). For example, we found that health and safety in an overall sense was much more broadly defined. Health for survival sex workers could be interpreted as physical or mental wellness or its absence but could also be construed as physical safety from abuse. Safety is a complex issue in the study of street survivors, but for the marginalized themselves, it can be a constant, overriding concern. Sex workers' lack of trust in police (Stardust, et al. 2021) and the effects of the perceived links between police and health institutions re reporting is another potential problem for sex workers. It is also assumed by most who worked directly with sex workers that sex workers would only trust doctors or nurse practitioners if they can easily access

their services and then only if they can build a relationship based on confidence with them. This is in stark contrast to the lack of trust with Emergency Services in hospitals or with the police, reported by our interviewees. A few kind and caring nurses/doctors and police notwithstanding, the overall health system is considered by marginalized people as too unwelcoming, too judgemental, and too overburdened to take care of any but the most urgent needs (a bleeding wound, a clear need for surgery and/or suspicion of an internal injury) of survival sex workers.

*The stories that we hear from the clients we serve are usually painted by violence, by aggression, by judgement and stigma ... and therefore people just get to a point where they just no longer go to hospitals. They no longer ask for help. They no longer seek health care. Then you have people who are dying because their health needs go unattended—that's people living in community, people living in jail, [who] of course are largely denied healthcare. A woman who we have worked with refused to go to the hospital because she knew that they were going to judge her because of her addiction, and she ended up with sepsis and almost died because she wouldn't go before it got to a point where she was going to die. So these are the types of experiences that our clients are navigating. (4)*

Lack of trust in the health care system and a reluctance to access it can be explained through incidents like this:

*One of the individuals [had] her perineum cut, and when she went to the hospital, they didn't ask one question and released her. Once it was fixed, they just sent her basically on her way. I asked, did anybody ask what happened, or why it happened? They're like, no. I said, so you went in [to the emergency room with a severe cut], and not one person asked what happened? (12)*

Part of the difficulty of access to health services is accessibility to services not considered part of health care or that are not properly understood by other agencies. There is evidence that some women who have been confined and abused sexually sought out help from intimate partner violence agencies, but these support agencies did not understand the specific needs of sex workers. The following example from a rural non-profit illustrates this issue:

*I worked with a woman who had been branded with quite a few tattoos, and I was working with another agency that professed experience working with women who had been trafficked... I said, "... in your victim services plan, " where are things [about] tattoos?" And they're like, "What do you mean?" And I said, "Well, is there money there for makeup to cover them? Are there plans to have the tattoos redone?" And [they said], "Oh no, that never really... we never really thought about that." And I said, "Those tattoos [show that] she's very clearly branded. Those are brands. They are not her choice." (Rural 5)*

The shortage of medical doctors is a known and pressing issue throughout the province of Nova Scotia, but in the HRM, the influx of new populations into the city core means that the issue is particularly serious. These populations are a mixture of, on the one hand, privileged and socially mobile people from other provinces who often buy new homes at inflated prices and, on the other hand, formally rural or semi-rural Nova Scotians living on meagre means. In fact, our interviewees believed that sex workers and others are moving away from the city core due to the increased prices of housing, further negatively influencing their access to healthcare. During Covid, reduced opening hours at community health clinics and the redeployment of medical staff to labs and testing facilities became common as the pandemic dragged on, and the subsequent pressures were especially poignant during the surge resulting from the Omicron variant, as exhausted hospital staff were barely able to manage Covid patients, let alone any others.

*So, a lot of people passed away this year [from] a lot of overdoses, a lot of undiagnosed illnesses. I think that they fell through the cracks during Covid. It was kind of like if [a person] didn't have Covid, then they didn't top the charts at the hospital. I think Covid did play a factor, [even though] that was not why people passed away. I think it was the lack of care that people were receiving. They're just falling through the cracks. None of them have a family doctor. A lot of them haven't received the best treatment at the hospital or [from] the medical field. (12)*

Failures within the emergency medical system can clearly have dire consequences, especially for vulnerable and marginalized persons, for whom it may be their only point of contact with doctors and other health care providers. But emergency departments are only part of a wider health care system, and problems there are often products and symptoms of breakdowns elsewhere, as highlighted by the following interviewee.

*If we do not provide properly for people who are marginalized, they will show up in the systems that do exist as "problems." So, if you get a kid who's poorly housed,<sup>8</sup> who has very poor income assistance, who uses too many substances, and they show up as a social case in an emergency department and that [department] has no place to send them, then that kid represents a problem at the Emergency Department. Even the best nurses are limited in what they can do. (8)*

In addition to the complex problems discussed above, many of our participants also pointed out that rurality can add another dimension to the issues of health and health care for the marginalized:

*I think in a lot of emergency rooms, sometimes when people come in there's just this assumption that "oh, you're just looking for drugs." And that [assumption] actually is*

---

<sup>8</sup> There is only one housing shelter (Phoenix House) that aims specifically to support youth in the HRM.

*really detrimental to folks' health and safety in general. When we did our survey last year, we asked about best and worst services that people had received and what made them good and bad and particularly [their experience with] rural hospitals. I do think it's worth making the distinction between services and supports and understanding and awareness of the issues in urban versus rural locations. Everything that may be a challenge in and present in our work in an urban context is worse by about 20 times in a rural context. (5)*

*If you have that internalized belief about yourself, that you're disposable and the person pimp who has been controlling the source of your survival [and your] basic needs is telling you that if you get help—if you go get your medical needs met, if you go here to try to get safety [they falsely threaten you with] “I have inside connections.” When you're talking about safety for sex workers, where does that put them? A person needs enough resources and [to] not be isolated often for that to happen. (Rural 6)*

*Rural towns are getting better, but it's not a welcoming place to be out. So you would try and get out of your small town as soon as possible for those who can, and then you're just subject to a lot of scrutiny [and] off-colour comments and microaggressions ... not feeling a sense of belonging, not having the support systems. (Rural 2)*

## V. Violence

All of the interviewees spoke about the violence they had heard about or witnessed in their interactions with sex workers, especially towards more marginalized populations. They spoke to the overrepresentation of Black Nova Scotians, Indigenous peoples, and Trans women in the populations they serve. The most disturbing stories we recorded for this report were abuses committed against Indigenous, Black, and Trans sex workers, a trend that has been well documented (Baumann et al 2018). One health care provider recalled:

*I definitely had a patient that was covered in bruises from head to toe. She said she woke up in the woods and was just covered in bruises and she came into us. We were the first people that saw her because another option is to go to Emergency, and you can imagine how intimidating that is for a lot of people. This person was Aboriginal, and I don't know if she was a sex trade worker, but there were some concerns. ... We did end up sending her, I think to Emergency because we need to make sure she didn't have anything broken or, you know, a head injury. (2)*

Indigenous sex workers have a dual burden in trying either to live within their usually small communities or leaving community with all of the attendant difficulties of extracting themselves from family and linkages to their heritage in order to do so. Leaving was not easy for those from designated communities. Relations between band councils, lack of housing on reserve and routine violence as part of Indigenous heritage and life were all complicating factors:

*I think [there is a risk of] a lot of shame [in Indigenous communities]. I think because there's a lot of, you know, maybe relations happening between family members, and so there's a lot more shame that comes with that too. People don't talk about it as much*

*maybe [but] people don't have an opportunity to reinvent themselves, you know ... like once you're sort of painted with a certain brush, that's where you stay, and it's really devastating for a lot of people, especially people who are trying to commit to recovery and who are really trying to turn things around. It's really tough. (10)*

One contact we interviewed indicated that “many” of the sex workers, in fact “nearly all” she was working with are Black or Indigenous women. Despite this overrepresentation, which was corroborated by other respondents, we were able to locate only one staff member of a non-profit who was Black<sup>9</sup> and one Indigenous worker to interview for this study. We believe the lack of non-profit workers from marginalized groups is an indication of the ingrained racism of our system despite the best efforts of individuals in non-profits and community work to assist sex workers.

We heard several references by respondents to violence that we would call sex trafficking (use of force, fraud or coercion, control, grooming, and other tactics). Most of the violence noted by the interviewees came from pimps, family members, and others who controlled the sex workers. We heard two accounts of women being kept in what were referred to as “trap houses,” where it was claimed they were kept addicted and forced to work as sex workers.<sup>10</sup>

*We had a woman who came from someplace else, and she was in a lesbian relationship. She got here, and they had a fight, and her partner abandoned her here. And you know, she had no money, she was just kind of like left on the side [after a] very abusive relationship. [She was] just kind of left on the side of the road, and unfortunately the people that found her and took her in were involved with one of these trap houses where she was held and confined for quite some time. So as soon as she got out of there, she went into a drug recovery program because she'd been kept drugged the whole time she was there. (Rural 5)*

We also heard three accounts of the “branding” of sex workers and the negative consequences of the branding for the women involved.

*But there are a lot of other pimps [who] would tattoo their names on their women. ... I would say a lot of people [have] branding. I don't know if they are part of the gang, whether they get their name tattooed or get their tattoo done “for them,” but I would say [this is the case for] 20% of the 350 programme users. (1)*

*Then for anybody who's in the know, they see you [with the branding] and they know that you're kind of a “throwaway” person—that's in their mind, that's where they put you.*

<sup>9</sup> During the course of the interview, this source referred to their own marginalization as a community worker. Another participant was Black but was not working for a non-profit

<sup>10</sup> Verifying these accusations of branding and of trap houses was beyond the scope of this study.

*[And then] you're [more likely] to be revictimized if people know what that brand means, as they already know that you've been victimized. You're going to be revictimized. It's like walking around with a bullseye on your forehead. It also makes you extremely obvious in a small community, right? People can pick you out pretty easily, you know, as the person that has such and such tattoo on their neck, people know that. (Rural 5)*

Trans women sex workers experience especially egregious violence (Baumann et al 2018) and were specifically referenced/singled out by many of our respondents as having particular needs. Trans workers are often grouped with other 2SLGBTQ, as they suffer the same abuse within certain systems, but we single out Trans workers here because their experiences were so consistently described as being dramatically different (Lyons et al. 2017).

*Some of the research that we've done is looking at the experiences of 2SLGBTQ folks who are navigating or involved [with] or interacting [with] the criminal justice system in Nova Scotia. And that research itself has revealed that it is incredibly traumatizing, that they experience gender violence, that they experience homophobia and transphobia by police officers, by lawyers, by corrections officers. So pretty much at every single interaction within the system, [2SLGBTQ] people are experiencing oppression based on their identities. (4)*

*[Trans sex workers] are very vulnerable, and it's hidden. The folks that I know often first became exploited while still identifying in their male form as gay men, gay boys generally, and came out as Trans women through a process and often even while being exploited. So, the person I was just telling you about was sold ... as a fourteen-year-old boy to a man in his 60's, and the grooming began. Then through that process [she] identified then as a woman and then ended up getting trafficked and sold into the sex trade. She was an adult [but] when it happened, she was horribly exploited. Some of this is next-level awful... This particular woman spent a few years living in a cage ... that's how bad it was. And not allowed to do anything for herself. She was caged when she was not working. There's some really horrific things that are going on in the real underground world ... really, really horrible. I mean, she's had all her fingernails ripped off as punishment and her teeth pulled out. (3)*

*[Trans] experiences are even more egregious, even more violent, and based on their interactions with the justice system, they're even less likely to report any victimization or crimes to the police ... for a host of reasons that I already suggested but also just because, in my experience of working with particular Trans folks, they are the last people to be believed for anything. There is in our community a very underground violent human trafficking ring of Trans individuals ... that has gone completely unnoticed. There are victims who have experienced unbelievable violence who are Trans individuals and who are living in the shelter system in our communities. I have personally worked with two individuals who identify as Trans who have been involved in this and who have experienced being locked up, beat, burned, cut... (4)*

*We see more violence towards this group, Trans women. We are getting more calls from Trans folks who are in sex work, and you know, they get judged. It's even ... another layer of violence from community members, violence from male[s.] from people, from*

*everywhere. So, I think for them, they need even an extra layer of support in terms of their gender identity. (7)*

*I think there's an increased barrier for men or trans men, trans women to come forward to share their stories because even if they are believed, they're going to be ridiculed, they're at risk of further violence, because there are people who will kill you for how you identify, and in a small community, there might be more of those than you might find in an urban area. (Rural 2)*

There is a level of vulnerability for all who transition, but it seems to be a serious level of concern for younger folk coming out as Trans, who are isolated from family (some because they have come out as Trans, others because of violence in the home, still others who simply want more freedom) who end up living precariously. Sofa surfing and bunking casually with others can become a way of life but can also be highly dangerous.

*It's predicated on an understanding that there are queer young Trans folk, queer and Trans and young folks in this city who live in marginal situations in collective houses or sofa surfing among friends who are disconnected from family, who use sex work to make ends meet, who are regularly subjected to the most horrendous forms of violence ... and accept [those] forms of violence as the price you pay to be in that world. (8)*

*In the case of the chained and detained situation [I described earlier], remember that [the perpetrators] used him for 10 days. They had a man from Bridgewater come and have sex with the boy while he was with them, and they were trying to see if they could sell him online. ... We need to talk about this because this is the scary underbelly of what is happening in terms of sexual violence to young men in this city. And this had a queer element because the two men who were involved were a couple who were well known as a couple who regularly pick up young men and take them home and ply them with drugs and alcohol in exchange for their sexual services. ... So that level of violence is an accepted or acknowledged part of the lifestyle of individuals who are engaged in this sex working space. (8)*

## VI. Reporting Hesitancy and Relations with Police/Health Care Systems

Sex workers suffer violence from clients, pimps, and often the police themselves, and because of negative experiences with police (McBride et al. 2020; Goldenberg et al. 2020), many sex workers do not see police as allies.

*If [the police] put them in the car, [...] they'll handcuff them, put them in the [back] seat, won't put the seat belt on, and then speed up [and] slow down so [the detainee] would hit the back of the plastic... So this one specific case that I'm thinking of, they picked her up. They did [the thing with hitting] the plexiglass, the stop and go. And then when she got to the hospital (because she was attacked with a box cutter [and] needed to get surgery stitches) ... she had to go pee, and they wouldn't let her go. Like, the police stood there and wouldn't let her go to the bathroom. So just stuff like that. (1)*

*There was a woman recently who was arrested because she was in breach of her court conditions, and she said that the officer was hitting on her. And so it's just like, they just have these wildly inappropriate experiences that range from hitting on someone to beating someone over the back of the head with a baton. And so when someone experiences a crime themselves, they have no interest in bringing that forward. And that's one of the first questions we will ask women when they're victimized ... we will ask them, of course, are you interested in reporting? And the answer is always "no." (4)*

If a client has unpleasant encounters with the police in the past, they are unlikely to report any further abuse, regardless of severity.

*I think it is like the rules or the policies in the laws against sex workers. They don't feel they are protected. They don't feel like they can go to the police. They had such bad experiences, maybe in the past when they went to the police and it just got thrown out, so it's kind of like ... why would I go and put myself through that again? (1)*

Sex workers were highly resistant to reporting to the police (McBride et al. 2020; Goldenberg et al. 2020) even if they had been quite severely abused.

*Why don't people report? They do, they report to us. People come back here after a bad day ... why? Well, they've had previous experiences, they feel that they've not been heard, they haven't been believed, they're discredited, their complaints are minimized, they've had their own experience with policing. (11)*

*The fact that it [is] criminalized, the fact that there's usually overlap with drug use, or you know, in those spheres, even if you know the selling of sex isn't illegal, the substances that might be used would be, so you can't [report]. You're opening up a can of worms if you report anything, because then there's an investigation, and how would I say this? The police would rather bust you with two grams of cocaine in your pocket, open and shut the case than investigate a John who's being abusive—because that takes investigation hours, it takes manpower. [Whereas if] you see drugs, it's there, [a] done deal. So it puts so much weight on drug cases instead of violence cases, and that's something that really needs to change. (Rural 2)*

Some of the reasons sex workers often won't report violence include having a criminal record, having prior infractions revealed, and/or fear of becoming criminalized (McBride et al. 2020)

Below are examples of why this might happen, why sex workers believe that the health care system and the police are “linked” and why they avoid both:

*If a client [has] experienced violence in the community, if they go to the hospital, then the hospital has to flag that with police [to report], but they don't want to go through the process because there's so many judgments going on even within the healthcare system. (7)*

*... Last Friday, somebody was assaulted, and she doesn't know what happened when she was not conscious. She overdosed, and you know she doesn't know what happened when she was not awake. She has bruises, and ...she won't press charges, she won't call police*

*because there is a warrant [out] for her, and so you know when you are criminalized and victimized—which goes hand in hand all of the time, you know—there is no justice. (10)*

*We work a lot here with stabilization, working with individuals, getting to a place of being able to do trauma processing work. Like you need these basic things before we can get to this. So let's build this safety, [let's address their] hierarchy of needs. Building that before you can get to this place of working on these long-term impacts of relational childhood trauma ... because of the history ... of how individuals have been impacted by police, how they don't trust police, it's a further barrier, a further piece that isolates them from being able to get the supports they need... (Rural 6)*

Not all reporting hesitancy was due to fear of police (Krüsi et al. 2016); some was due to fear of perpetrators. Some of our interviewees acknowledged the continued existence of “pimping gangs.”

*I also think that there's a lot of fear. Like, in Halifax, we have the North Preston's finest, [and] there's a lot of fear. The women taught me “snitches get stitches” so they don't bring the information forward because of fear. (1)*

The word “safety” was used by interviewees in a variety of ways: to refer to shelter from dramatic weather or extreme temperatures, or to maintain a sense of personhood—especially with regard to the most marginalized clients and patients. But “safety” most often referred to physical and emotional safety from the threat of violence, whether at the hand of “bad dates,” pimps or the police.

*Our clients aren't stupid. They know exactly how they're seen by police. You know they live their lives; you know exactly how they're treated [due to] their race, [due to] sexual orientation, [due to] their identities, due to being poor. Because they've lived in this world, and they're not going to be as likely to be believed, they're going to be going to be harmed. The cops abuse, so how are you going to go to this ... misogynistic institution to report that you've been harmed, when you are already known or seen as “less than” and found not really worthy of safety anyway? (3)*

Survival sex workers are complex in their presenting needs, and if they are addicted, they can be (re)criminalized upon reporting any violence. Hesitancy, under these circumstances, is understandable:

*It's very rare that we have someone that we work with who's been sexually assaulted [who] then wants to file a report. You know, our clients generally have ... that intersection with addictions and sex work. So they may be doing sex work and then purchasing drugs or some combination of both. So because of that, there's a tremendous vulnerability because they're afraid of being criminals. (3)*

*So, if somebody gets assaulted while they're turning a trick, it's not viewed as an assault by some responding patrol officers in particular. And then if people do come forward, they are met with that non-belief or victim-blaming in that very vulnerable time. If that's their*

*first response, then they're never going to come forward again. If they try to come forward, and it's met with either blame or shame, the likelihood that they would come forward again [is] reduced. (5)*

*People say, "Why wouldn't they come forward?" I'm like, "Why would they?" Absolutely, why would they? You know, I couldn't think of too many reasons why you would unless there were witnesses, unless there was like video recording. ... I don't know what there would have to be for somebody, especially an Indigenous person, to truly have confidence from the legal system ... to give them justice. (Rural 2)*

*It's a small-town police force, and so, you know, sometimes people will come in, and they're like, "Oh, it's Laura again." So it doesn't matter if Laura was sexually assaulted. It doesn't matter if Laura is like, well, Laura's the one who's done X, Y, and Z and, and... you know. So, I think people are categorized. I think in rural communities, people are categorized early and often. I mean, there are people, ... whole families that are categorized as being problematic. (Rural 5)*

But not reporting crimes to police has negative consequences for sex workers as police reports trigger access to other important services:

*The other thing that they'll tell us is that they're so often told, you know, well, what did you do? Did you try and rob him? Did you try and beat him? Is it your fault, hey, hey? We hear that, you know: "What do you expect ... it's a risky business, right?" So it's really hard for someone to speak up. And if they can't make a police report, [intervention and support from] victim services don't happen, health services may not happen. (11)*

*One of the reasons I believe that women won't seek help for the victimization that they get doing the sex work is because women aren't believed overall. Women outside of that industry are marginally believed when police are brought in, and so women who put themselves out there to be vulnerable almost get ... zero [indication of] belief when dealing with the policing industry. (Rural 3)*

*Their experiences [dealing with the police] weren't good. We'll just put it that way. Her having the experience with being sexually assaulted by this cab driver, but because she was also known [to the police] as a sex trade worker, she was treated differently. The first thing [she was asked by police was] "Well, is he a John?" She was asked all those other questions that normally wouldn't be asked. (Rural 7)*

*I don't know how to make our clients and vulnerable folks call the police. I really don't. I don't know what the shift is. Continuing to have the conversation, continuing to keep the lines of communication open, and safe, you know, I would say the onus is on the party in power to make accommodations, to make it safe for the folks who do not feel safe, and the onus is on the parties in power for them to figure out how to make it safer for everyone, because they are there to protect and serve everyone [and this obligation includes] the healthcare system, the justice system, and community services. (Rural 4)*

## VII. How Survival Sex Workers Provide for Their Own Safety

Safety is defined in a number of ways by those who deal primarily with survival sex workers. Safety in an absolute sense can be an absence of violence or freedom from abuse; this sense of safety is rare for street sex workers. Safety can also mean a feeling of trust. Both types of safety were referenced in the interview responses. We identified seven key strategies employed by sex workers to try to maintain their own safety:

1. Sex workers seek help from a trusted practitioner (such as an outreach nurse or doctor) or other service provider (shelter, housing, clothing, food, or other services). Trust is essential to getting consistent health care services, trust is essential in reporting abuse and trust is essential for getting help on a day-to-day experience. Trust is hard won, for sex workers.

*Sex work safety is for ... the folks that we work with ... entirely related to community. And so having a supportive community—generally of women or other trans, non-binary folks who also do the work [can help] provide safety, through the community. [This community tries to] identify individuals who have caused harm ... so that you can stay away from those individuals, or [others in this community help by] creating a variety of different kinds of methods to stay safe. Safety doesn't come from our state—that is not where safety resides. (3)*

2. Sex workers are selective about sharing information with some community health care outreach or non-profit workers so that their personal information is protected.<sup>11</sup> This is a double-edged sword, however, because there is a potential to miss the “larger picture” in terms of ongoing care, even for treatable conditions such as Hepatitis C or diabetes. Furthermore, if someone is unhoused or precariously housed and is looking for shelter or food, the next fix, or the next client to get money for bus fare, for example, there is little incentive or practical scope to schedule appointments several days or weeks in advance, though that is normal practice for the rest of the population and indeed the way that much of the health care and state administration system is structured.
3. Sex workers also try to manage their safety by having cell phones and checking in with trusted others.

---

<sup>11</sup> One participant told us that sexworkers do not trust “anything that can be written down or recorded” for fear of arrest or harassment or the possibility of being denied a needed service. This includes health care data, as there is a great distrust of with whom that might be shared.

*We also need to make sure they have a phone and that it's working and that it has a plan, and they may want to set up that they're going to call once or twice when they're out on a "date" ... just to say "I'm checking in." We don't need to say much more than that. They may make an agreement with us [such as] "if you don't hear from me by a certain time, then please raise the alarm." (11)*

4. Survival sex workers share information on "bad dates." A bad date is someone who is violent, who becomes a stalker, or who doesn't pay or even steals from a sex worker. At least one agency maintains a regular list of such dates, which is available to all who need it. Also shared is information about "bad cops" and "bad deals" (often involving tainted drugs).

*I think we know some things that make it safer from our context: obviously, you know, a phone and a phone plan to communicate a bad John's list... Like, don't use [drugs] alone; have a buddy or a friend or a shelter or a family member or someone who knows who you're going with or how to reach you or what the window is that's considered to be ok. Sharing information with others, if someone is known as a bad date. (11)*

5. Another strategy for enhanced safety is to work only with trusted regulars.

*One thing I do notice is some of the patients that I've seen tell me that they have regular clientele, and they try to keep that number down. Like, they try to keep it to 10 or so people that they like in regards to safety, 10 or so people that they feel comfortable with, that they trust, you know? And that's one way that they are, I think, keeping safety. But a lot of them are using online. (2)*

6. Two health care providers in very different settings reported that some sex workers take the initiative to document injuries from a violent encounter "in case they need it later on." This is definitely a strategic move (Law and Menaka 2020) but runs counter to the usual practice encountered by other health care workers. As noted, there is a perception by sex workers that personal information is widely shared between emergency services, community health services, and the police, even though, as attested by many of the community services we interviewed, in reality they simply do not have the means or will to do so. Nonetheless, this perception of a network of shared data seems to prevent sex workers from reporting their experiences, either for future use or immediate need. Further, stigmatizing events from police officer encounters are shared among sex workers. Distrust of police and health care workers is further deepened by the experiences of racism and transphobia also encountered by Black, Trans or Indigenous sex workers.
7. A less safe but still strategic option for sex workers looking to remain safe is to take refuge with a john for a night so that they don't end up sleeping in the rough. This is highly

precarious, however, and works only with trusted “regulars.” But it shows ingenuity in attempting to get basic needs met (Lam 2020).

*People who do sex work ... how we gauge the kind of vulnerability and dangerousness I think is overlooked sometimes. I do think it's a pretty common[ly] held belief that the people sleeping in tents or people sleeping outside right now are the most vulnerable. In some ways they are, but like I said [some] don't see that just sleeping with a john for a warm place to stay... they don't know that guy, maybe he could be a mass murderer, he could be a serial killer, and you just don't know [but] at least that gamble is better than sleeping outside in -15 temperature. (9)*

## VIII. Recommendations

The Covid-19 pandemic has prompted a worldwide public health crisis, and the circumstances of those who were already vulnerable have, in many cases, been severely exacerbated. The crisis in Nova Scotia has made community support services more crucial than ever. As public health and movement restrictions increased, agency capacity often decreased based on threats of illness, overwhelming need coupled with fewer supplies (created by both increased need and supply chain shortages), a reduced ability to test for common diseases and the beginnings of health care workers and agency workers themselves getting Omicron, the more infectious variant in this latest wave. However, there is no dispute in our interviews that already marginalized survival sex workers, the unhoused, and those who are routinely discriminated against because of being Trans, Indigenous, and Black were the most negatively affected by the rapid and disruptive shifts brought on by the pandemic.

We offer the following eight recommendations to increase survival sex worker safety in the HRM and in the rural areas we studied in Nova Scotia:

### 1. Decriminalization and/or Regulation of Sex Work

The most important recommendation that emerges from the research is the complete decriminalization or regulation of sex work in order to avoid the criminalization of clients who are not abusive, to prevent survival sex workers from being under constant surveillance by police, to reduce stigma, and to normalize commercial sex transactions (Armstrong 2019; Belak 2018; Benoit et al 2021; Benoit et al 2017; Bettio, Giusta, & di Tommaso 2017; Butterfly 2021; Deshalit, van der Meulen, & Guta 2021; Fudge et al 2021; Jeffrey and MacDonald, 2006; Magnan-Tremblay, Lactot & Corvette 2020; McCausland et al 2022; Ralston 2021).

Decriminalization would entitle sex workers to more rights as workers (as a profession under the Canada Revenue Agency, for example), would enable those who commit acts of violence to be charged, without the risk of victims also being charged alongside, and would help to ensure the safety of the most vulnerable in our study—Trans, Indigenous, Black and survival sex workers, by eventually destigmatizing sex work and allowing sex workers to report violence against them.

*We need to decriminalize sex work, and to decriminalize sex work means we have to decriminalize procuring sex workers. So I'm saying it should not be illegal to pay for sex. If it's not illegal to sell it, it can't be illegal to pay for it. What is illegal then is to abuse your sex worker, and I think that if we decriminalize that whole exchange, then [what] we would see happen with the violence against sex workers [is] the same thing that we saw happen to female partners in domestic violence situations: there became greater capacity for people who are victimized in their intimate partnerships to come forward and seek service and redress and to leave those circumstances. (8)*

*There's still a lot of stigma around sex work, and of course that comes from the criminalization that sex workers still experience, even though the law was changed. The laws in the sections of the criminal code were changed, purportedly to not victimize sex workers. I think they still do victimize sex workers... which further drives the transaction of sex work underground, and when something is underground and when it is so heavily stigmatized still and not accepted as legitimate work either and not supported under the labour code, under human rights protections ... [then] you're almost invisible and you don't count when it comes to the safety and security of the person. (6)*

## 2. Coordination of Existing Services Both in HRM and in Rural Areas

There is a need to coordinate the various services available for sex workers in the region. For example, there is a Metro Interagency on Family Violence in Halifax. As stated in the interviews, something similar needs to be established for sex workers, especially on health, safety, and housing services to enable consistency and shared information with agencies and clients on a more consistent basis. It should be noted that some agencies are already well linked; others are not, due to their distance from central agencies or their location on the boundaries of the city. A strong communication network could help all agencies.

*Ideally if you could have a one-stop shop, stop at the doctor, stop at Stepping Stone, stuff like [that] all in the same building ... because, you know, if they have an appointment, they might forget to go there. Many of them don't even know what day it is sometimes. So if you could just get them when they're [already] there, I think you would catch people instead of losing them during the transition. (12)*

*In BC, they implemented kind of like a provincial bad date reporting system that I would love to see in Nova Scotia [and] that wouldn't necessarily involve police.... We have to come up with solutions that don't involve police, as well as some more community-based solutions and responses because most of the folks we're engaged [with] are already marginalized and oppressed and don't view the police as safe people. (5)*

*These things that you would think would be so simple, like systems that don't communicate with each other... They're just so many things that could be done to improve on this, and then the more you dig, the more you realize, it's not the issue so much, that's complex—it's more like just, you know, the way we've always done things is archaic and doesn't make any sense.... You know, you just need some energy and you just need to be a bit of a hustler to kinda make some changes happen. (10)*

### **3. More Funding for Organizations Working Directly with Sex Workers to Create Community and More Resources in the Rural Areas**

Many of the interviewees spoke of the need for community and redirecting resources from the criminal justice system to community organizations. They spoke of the need for compassion and empathy and “treating people with dignity and keeping them safe because they’re human.” To that end, they wanted to re-think where resources go and how they are distributed. Those who work directly with sex workers feel as if they are simply patching the holes in the system that deals with the marginalized and end up doing the same repetitive activities with their clients. It is little wonder most of the interviewees are frustrated, tired, or even angry. The anger of the respondents is directed to police, primarily, and governments for their lack of funding. But all detail frustrations with the way systems work (or don’t work) for the most marginalized. All need more resources (both money and more people) to assist with what they see as the needless overload on service providers, exasperated by the additional weight a pandemic brings. This is particularly pronounced in rural areas.

*There's Elizabeth Fry, there's Coverdale, there are many more resources [in Halifax] for women who can help advocate for them or offer them some advocacy, offer them some, you know, support and navigating the systems or encouraging them to report. Where[as] up here ... we're kind of it. When we had a female in here that identified as being sex trafficked, the closest organization was the Y in Halifax to help her. (Rural 3)*

*Throughout rural Nova Scotia, it's a disconnected community, so it's not quite like it is in Metro, where there are specific services for folks engaging in sex work. [Here] it's a much more isolated event. And because it's a small town in Nova Scotia, there's a lot of secrecy around it. Folks aren't open about engaging in sex work. And I guess even if they are, their communities aren't, if that makes sense. So there's a lot of value judgements placed on sex work still. And that goes throughout the province, including Metro, but specifically in rural Nova Scotia, which has that lovely 1953 feel to it...which is charming for tourists and can be quite problematic for folks essentially facing poverty. (Rural 4)*

*I would recommend that they really think about the funding structures, the peanuts they throw at organizations like us and the mass amounts of money that go into policing... When [they] talk about safety [they mean] crime prevention, and ... we sort of heavily resource police and courts and jails even, but we don't resource our community organizations or our communities in the same way. So I've always said we should be flipping the way we resource. (3)*

*What people need is love and community and care and someone to call when they're stressed because they're in the grocery store and they don't know what to do. Or a person to text when they have something they're proud of—that's what people need. I can't find that properly because our systems aren't designed to allow me to do that... It isn't just a roof over their head or the cheque at the end of their week or ... even the groceries on their table. It's the people that they eat the groceries with and the people to be proud of them within the community and the care and the ... feeling of pride and sense of self and empowerment that you get from being part of something, you know? That's what will create more safety for folks. (3)*

*Because unless there's that safe landing space for you to move forward to, then it doesn't matter what you're trying to leave behind because you're just gonna continue to get sucked back because there's nothing drawing you ahead ... and so that's why, for example, E Fry, I think their work is so meaningful and important because they do create a community ... It's not just a community of recovery—it's like a community, it's basically just ... a new community. (10)*

#### **4. Education to Eliminate Stigmatization and Dehumanization and to Assist with Anti-racist Practices**

The level of discrimination and outright violence towards Trans, Indigenous, and Black sex workers is at a far greater level than their proportion of the sex working population. Anti-racist action and education has long been the call of communities to police.<sup>12</sup> Education and training should also seek to increase the knowledge and cultural understanding of professionals in mental health with regard to communities of Trans peoples, the racism and inter-generational violence experienced by Indigenous peoples, and what it means to be African-Canadian living in either the HRM or elsewhere in the province of Nova Scotia. Understanding the broader histories and the specific needs of these groups should be a priority for the highest level of government services but must also be communicated clearly to the small but powerful contrary publics who perpetrate violence, who earn money from and off the vulnerable, and who routinely discriminate against the marginalized through and around the HRM, and in the rural areas.

*I think you need to build trust. You need to have your face out there, and I don't know if that's whether the cops come and make themselves present or have that connection with the clients. I think [there should be] a lot of education around sex work, the stigma, even addictions and mental health. I think the police need to have training, but actually listen to the training, not just check off a box. I think there needs to be more education and actually listening to what's being taught. (12)*

*I think that the police services [and the] justice system ... need to actually work together with sex workers and the organizations that support sex workers to come up with solutions*

<sup>12</sup> <https://www.halifax.ca/sites/default/files/documents/city-hall/boards-committees-commissions/220117bopec1021.pdf>

*on building trust... We have all sorts of organizations that work on behalf of sex workers, but we need to hear from sex workers. It can't just be the people who work there, right? Those people have a role to play, but sex workers have to be front and center in the collaboration. I really dislike [when only professionals are interviewed]... I think that it further stigmatizes and marginalizes people who are the people who are experiencing the violence and the marginalization and the stigma. (6)*

### **5. Decriminalization of the Personal Use of Illegal Substances as Harm Reduction Strategy**

Decriminalizing the use of illicit drugs would have a similar harm reduction effect as the decriminalization of sex work (McBride et al 2021). Harm Reduction is simply that, adopting policies which reduce harm (such as needle exchanges) as opposed to criminalization (arresting for possession). The first tactic helps keep people safe from toxic substances in the drug of choice, the second does nothing but further stigmatize the individual. Addictions should be seen as a health issue, not a criminal justice issue. By adopting these strategies, the decriminalization or the regulation of illicit drugs could also contribute to a Harm Reduction approach to sex work by police, social workers, and health workers (Doctors for Decriminalization 2020; Munroe and Scoular 2013). Harm Reduction has been used successfully with addictions, with AIDS organizations and with sex workers. By contrast, many interviewees noted the problems with the criminalization of drugs and illegal drug-seeking behaviour.

*I actually think we need access to a legal regulated supply of drugs where nobody is making money off of it... I really do think we need access to a regulated supply of drugs that, you know, because you know, like you can decriminalize drugs, but people still have to access this toxic poison drug supply that's really, you know, that's funding organized crime. (10)*

Harm reduction is one of the only approaches to criminalized activities that actually works (Canadian Drug Policy Coalition; MacDonald et al 2013). Harm reduction is about ameliorating the damage caused by a lack of housing, addictions, chronic disease, and sex work, and creating safe spaces for people to live. It is a focus on people rather than their criminalization. AIDS organizations and community nurses and doctors have recognized the benefits of harm reduction for years and have operated needle exchanges in communities. Even some churches are now giving out free needles to their drug using clients and parishioners (Mehrabian 2021). Organizations in Halifax are opening a shelter soon that will allow their tenants to use drugs and sell sex as a harm reduction strategy.

*The Overlook is opening in the next three to five months... at the old Travel Lodge, and that's a really exciting development because the intention is ... that it will be a home for people who are using substances and involved in sex work. So that's exciting because*

*people are going to have to figure out ways for people to safely work there... It is harm reduction in its broadest definition, which includes allowing people to continue to work in ways that are safe... Without safe regulated supply of substances ... people are going to engage in sex work in order to buy drugs. So if we had safe supply so that people didn't have to work in order to earn money so that they wouldn't be drug sick, that would be really great, right? (11)*

## 6. Safe and Affordable Housing

Safe and affordable housing is a human right. The Canadian Charter of Rights and Freedoms does not guarantee the right to housing, but Section 7 has been used to argue for the protection of housing. The UN also states this right. Canada is a signatory to international instruments that provide for the right to housing (Canada without Poverty 2015; Art 25(1) of the UDHR and/or Art 11 of the International Convention on Economic, Social, and Cultural Rights; UN OHCHR, 2009.) Our interviewees drew a direct line between sex work and the need for housing.

*If you are a mom with two children in Halifax, you probably get close to \$1000 from income assistance, and from that, you have to pay your rent and your food. Yes, you get your child tax benefit, but that's meant to raise the children. It's not meant to be the rent, right? So where are you going to live? You're going to live in a neighbourhood that you're really trying to escape or that isn't it safe, or you're living in either low-income housing that you want to get out of, or there's not a whole lot of it.... We keep people poor, so we keep people augmenting their income with sex work. (11)*

*I got a call from the property manager, and they said, "Well, you know what, we're not accepting her application. We're not gonna move forward with the lease agreement." And I asked them why, and they said, "Well, we talked to some of the people who we know." They didn't mention any names, they didn't give me any details. ... "We don't want someone like her renting an apartment from us." And I said, "What do you mean, someone like her?" And they said, "we've heard that she's a quote unquote prostitute." And I said, "You have no proof of that, and even if she was, why [does] that [have] any impact on her suitability ... to get this apartment?" And they basically just said, "We're not renting to her. We don't have to rent to her, and we're not going to." And they just hung up the phone. And it was very ... it was that blatant. Like, they just said, she's a prostitute [and] we found out. (6)*

## 7. Cultural Shift around Sex Work and Sexualized Violence

There is a need to change perceptions around sexualized violence and sex work, both to end stigma and to rectify the ongoing issues in the legal system where the purchase of sex is criminalized but the selling of sex is not. The need to change perceptions around violent crimes against women, as well as an increased awareness of the need to end victim-blaming, has led to some key insights around the actual problems around prosecution, especially those cases with a "he said, she said" dynamic (Craig 2018). Further, the parallel between intimate partner violence

and sexual violence against sex workers and the resulting needs are underscored by participants' understanding of sex work (Nourpanah 2021).

*We really need a cultural shift around violence against sex workers and people who are trafficked ... because [...] we know even with intimate partner violence, [victims] are still blamed. Why didn't she leave? Why didn't [she do] this? Why didn't [she do] that? What did she do? Think about that in [the context of] sex work now. What would you expect? What do you really think? Are you the most important priority around here right now? [If] you get involved in this, what is going to happen...? (11)*

*That's the other thing: we don't ask people to prove that certain things happen to them. If you tell me you had a bad date and someone ripped off your money and didn't pay you and slapped you around, I believe you. I don't ask you to prove it. ... We're listening, but we're not taking notes, and we're not asking you to write it all down or to record it. ... The bar is so high for people to have to prove things. (11)*

With decriminalization comes the need to see sex work differently and to end the stigma around sex itself (Benoit et al 2021; Ralston 2021).

*I think it goes back to really basic things that people are very uncomfortable talking about sex. People are very uncomfortable with their own sexuality. Even though it's everywhere, even though sex sells everything pretty much right, but fundamentally people think that sex is wrong. I mean, I'm generalizing, but I think that there's a real current of that sex is still wrong, it's still shameful. (6)*

## 8. Poverty Reduction and Guaranteed Annual Income

Finally, all our interviewees spoke about the need to end poverty and to ensure that everyone has a living wage and the ability to support themselves. Resources that are currently put into the criminal justice system could be better utilized to provide a way out of poverty for the most marginalized.

*It's not about putting more resources into the justice system so that they can ensure that they're properly trained. Instead, they need to properly invest in communities so poverty [will] not exist, so kids are not growing up in really traumatic situations, so kids are not ending up in youth detention, so adults are not being criminalized and incarcerated. You know—proper addiction support and harm reduction services in our community. (4)*

We give the last word to someone who has been working for years with people at risk:

*We need to have a society that says: no matter who you are and what you do, you're not going to fall below this level. There will be housing; there will be economic supports; there will be health and human services; there will be education opportunities; and there will be pathways into sustainable lifestyles that involve civic engagement. And I say "sustainable lifestyle that involves civic engagement" because I don't want to say that employment is the answer. A sustainable lifestyle [...] gives you opportunities for civic engagement, whether or not your income comes from [employment]. So, if we said we're going to establish that as the foundation of our society and nobody is going to fall below it, we'd eliminate 90% of this problem. (8)*

## Glossary

The following terms appear in ***bold italicized*** text in the body of the report and are defined here:

***Accuracy*** – How often a method or subjective reasoning process results in a correct opinion or conclusion.

***Behavioural analysis*** – See *Behavioural profiling*.

***Behavioural profiling*** – An investigative technique used by law enforcement, psychologists, consultants, and academics to predict or approximate the personality patterns, behaviours, and demographic characteristics of undetected offenders from characteristics of offenses and victims.

***Best practice*** – An aspirational and optimal, but non-enforceable level of practice that exceeds the minimum *Standards of practice*.

***Bias*** – Any systematic factor that determines judgment other than the truth.

***Commission*** – Joint Federal/Provincial Commission into the April 2020 Nova Scotia Mass Casualty, also referred to as the Mass Casualty Commission.

***Dynamic risk factors*** – Changeable features of an individual and their environments that inform *Risk assessment* (such as age, mental health symptoms, and substance use).

***End-to-end evaluation*** – A technique that evaluates an entire process or method from beginning to end to ensure that it performs as expected or required.

***Field validity*** – Whether a tool or method is *Accurate*, *Repeatable*, and *Reproducible* under routine practice conditions typical of real-world work. Field validity should be empirically demonstrated rather than assumed.

***Foundational validity*** – Whether a tool or method is, in principle, *Accurate*, *Repeatable*, and *Reproducible*. Foundational validity should be empirically demonstrated rather than assumed.

***Forensic psychology*** – A subfield of psychology in which basic and applied psychological science or practice is applied to the law to help resolve legal, contractual, or administrative matters (including *Psychological assessments*, *Risk assessments*, *Psychological autopsies*, and *Behavioural profiling* when conducted to help resolve legally relevant matters).

***Forensic psychological assessment*** – A form of *Psychological assessment* undertaken in a legal context to address legal, contractual, or administrative matters.

***Forensic science*** – A transdisciplinary field that involves the generation of scientific knowledge and the application of science to assist matters of law.

**Framework evidence** – Evidence offered by an expert witness to inform courts about general scientific knowledge that bears on a legal dispute in the abstract, rather than individualized expert opinion evidence regarding the case or person of interest.

**Generalizability** - The extent to which results or findings obtained from one group of people or situations are applicable more broadly.

**Interrater reliability** – see *Reproducibility*.

**Intrarater reliability** – see *Repeatability*.

**Linear sequential unmasking** – A generic protocol that imposes order on the processing of evidence and shields analysts from potentially contaminating information.

**Norming sample** – The group of people tested to establish the measurement properties of a *Psychometric tool* and against whom future test-takers will be compared.

**Offender profiling** – see *Behavioural profiling*.

**Precision** – see *Accuracy*.

**Proficiency** – A practitioner’s ability to apply a *Foundationally valid* tool or method to come to the expected outcome for the tool or method itself (and ultimately, an accurate opinion).

**Psychological assessment** – An evaluation conducted to assess a person’s prior, current, or future emotional, behavioural, or cognitive functioning.

**Psychological autopsy** – A method used to clarify mode of death in equivocal cases by investigating psychological factors surrounding the death and the deceased.

**Psychometric tools** –An approach to measuring people’s emotional, behavioural, or cognitive functioning employing varying degrees of structure and standardization.

**Quality assurance** – A management method involving administrative and procedural standards to prevent mistakes and avoid problems in service or product delivery.

**Reliability** – see *Accuracy*.

**Repeatability** –Probability that a method or practitioner consistently produces the same results when used to analyze the same materials on subsequent occasions.

**Reproducibility** – Probability that a method consistently produces the same results when used by different practitioners to analyze the same materials.

**Risk assessment** – An evaluation conducted to identify, analyze, and mitigate the effects of potential future events; used in psychology to evaluate a person’s propensity to engage in a future behaviour of interest and strategies for managing those risks.

**Standards of practice** – The minimum level of practice required in a field, such as laid out in legal or administrative rules and ethics codes, and which may be enforceable.

**Static risk factors** – Historical or unchanging features of an individual and their environments (such as age at time of first offence, gender) that inform *Risk assessment*.

**Structured actuarial assessment** – A form of psychological evaluation based on information derived from formalized psychometric tool(s) with statistically-determined rules for what particular values or scores mean on the measure(s) and how those values should be interpreted.

**Structured clinical judgment** – A form of psychological assessment that combines formalized decision-aids such as checklists with subjective reasoning.

**Unstructured clinical judgment** – A form of psychological assessment that tends to be subjective, flexible, and intuitive and is based on the practitioner’s clinical reasoning rather than psychometric tools.

**Validity** – see *Field validity*, *Foundational validity*, and *Validity as applied*.

**Validity as Applied** – Whether a *Foundationally valid* tool or method is, in practice, *Accurate*, *Repeatable*, and *Reproducible*. This can be established via *Field validity* and *Proficiency*.

## I. Representations to the Commission

1. The undersigned **Kristy Martire** and **Tess Neal** make the following representations to the Commission, as required per the Nova Scotia Civil Procedures Rule 55.04 1 a-e:
  - a) The expert is providing an objective opinion for the assistance of the Commission, even if the expert is retained by a party;
  - b) The witness is prepared to testify at the trial or hearing, comply with the directions of the Commission, and apply independent judgment when assisting the Commission;
  - c) The report includes everything the expert regards as relevant to the expressed opinion, and it draws attention to anything that could reasonably lead to a different conclusion;
  - d) The expert will answer written questions put by parties as soon as possible after the questions are delivered to the expert;
  - e) The expert will notify each party in writing of a change in the opinion, or of a material fact that was not considered when the report was prepared and could reasonably affect the opinion, as soon as possible after arriving at the changed opinion or becoming aware of the material fact.

X 

Kristy Martire  
Associate Professor

X 

Tess M.S. Neal  
Associate Professor

## II. Our Opinion

2. In broad terms, **forensic psychological assessments**<sup>1</sup> seek to measure, predict, or describe an individual's mental state and/or associated behaviours in a legal context. We regard **Psychological autopsies** and **behavioural profiling** as used by law enforcement agencies as types of forensic psychological assessment.
3. Psychological autopsies meet the definition of forensic psychological assessment because they aim to retrospectively assess the role of psychological factors in the equivocal death of an individual that is of legal interest. Behavioural profiling can also be considered a form of forensic psychological assessment because behavioural profiles use crime scene analysis to approximate the psychological and behavioural characteristics of an unknown offender.
4. Therefore, given that both psychological autopsies and behavioural profiling can be considered forms of forensic psychological assessment, it is our opinion that the norms, values, and expectations for **best practice** in forensic psychological assessment should apply to these techniques. Of note, other mental health professionals such as psychiatrists also provide forensic assessments; the best practices we outline in this report generally also apply to evaluating the quality of psychiatric assessments, although the specific ethical requirements, practice standards, and proficiencies may differ.

---

<sup>1</sup> Terms in **bold italics** are defined in the Glossary.

5. In forming this opinion we also note that psychological autopsy and behavioural profiling depart somewhat from typical forensic psychological practice. Specifically, while we generally expect qualified licenced/registered psychologists (and other mental health professionals) to complete psychological assessments, non-psychologists routinely provide psychological autopsies and behavioural profiles.<sup>2</sup> This caused some difficulty for us in mapping best practices from **forensic psychology** and psychological assessment onto psychological autopsies and behavioural profiling.
6. However, in writing this report, we have taken the view that when providing a psychological assessment in a legal context that relies on the norms, esteem, and values of science, then the best practices for forensic psychological science should apply. We acknowledge there may be differing views about the acceptability of this approach, particularly among practitioners from outside the field of psychology. Ultimately, we leave it to the **Commission** to determine whether and the extent to which the best practices described here apply to the specific psychological assessments they wish to evaluate.
7. With this in mind, we draw upon the best practices for forensic psychology assessments as defined by decades of research and scholarship from and about fundamental basic science and forensic science, as well as clinical and forensic psychology.

---

<sup>2</sup> Kocsis, R. N., & Palermo, G. B. (2020). Clothes don't maketh the man nor a criminal profiler an expert witness. *International Journal of Offender Therapy and Comparative Criminology*, 64(12), 1317-40. <https://doi.org/10.1177/0306624X20909218>

8. Based on our engagement with these literatures, it is our opinion that the following factors should be used by the Commission to evaluate the rigour and value of a psychological autopsy or behavioural profile:

- 1) The foundational validity of the assessment
- 2) Validity of the assessment as applied
- 3) Management and mitigation of bias in the assessment
- 4) Attention to quality assurance
- 5) The method used to communicate the results of the assessment
- 6) Limitations and assumptions of the assessment
- 7) Alternative views or disagreement regarding the assessment
- 8) Adherence with ethical obligations and codes of conduct.

These best practice considerations are explored in detail in the subsequent sections of this report.

9. Finally, we also relied on these best practices in preparing this report for the Commission. We offer an assessment of our efforts at the end of this report. As part of our process, we created a page on the [Open Science Framework](#) to make available any documents that should be publicly accessible, as well as our report itself, when it is released through the Commission process.

### III. Basis for Our Opinion

#### The Theoretical and Practical Context for Our Opinion

##### *Legal Assessment of Expert Evidence Quality*

10. Our opinion about best practices for forensic psychological assessments – including **risk assessments**, psychological autopsies, and behavioural profiling – is informed by considerations the law uses for evaluating the quality of expert evidence. While it is not our intent or within our area of expertise to provide an analysis of expert admissibility

law, we engage with admissibility at a basic level because it provides relevant context for our report.

11. Legal systems struggle to design expert evidence admissibility rules that effectively screen out “junk” science while still allowing sound evidence to inform legal proceedings, in part because different expert domains have different standards and norms for what constitutes acceptable practice. These challenges have led the legal systems of different countries to establish evidence admissibility rules, which aim to help judges and courts discern the quality of evidence proffered by experts. In most common law countries, increasingly rigorous evidence reliability rules have been introduced to regulate complex expert opinion evidence,<sup>3</sup> and revisions to these rules continue to be considered to address myriad problems with expert evidence.<sup>4</sup>
12. In the 1990s, the United States introduced new expert evidence admissibility standards in a trilogy of Supreme Court cases,<sup>5</sup> which were codified in a revision of Rule 7.02 of the Federal Rules of Evidence.<sup>6</sup> The Supreme Court of Canada adopted and expanded similar standards.<sup>7</sup> Generally speaking, in North America, judges are

<sup>7</sup> See Beech, C. (2015). The admissibility of expert opinions in Canada courts. *Law and Business Review of the Americas*, 21(3), 361–68, <https://scholar.smu.edu/lbra/vol21/iss3/7/>; *R. v. J.-L.J.* (2000), 261 N.R. 111 (SCC); *White Burgess Langille Inman v. Abbott and Haliburton Co.*, 2015 SCC 23.

expected to consider the reliability of expert evidence before allowing it into court. Some factors judges can consider in deciding whether to admit the evidence include whether the method used by the expert has ever been tested, whether it has been subjected to peer review, its error rate, and whether it is generally accepted by other experts in the field. Notably, similar factors have been identified to aid legislators in considering the integrity of science, as well as other factors relevant to best practice in science, such as accountability to ethical principles, the appropriateness of an expert's qualifications, and considering the potential for bias.<sup>8</sup> As such, particular questions can be asked to assess the quality of experts and their methods.<sup>9</sup> In this report, we address these issues and pose questions inspired by these guidelines to aid the Commission in considering the quality of the psychological assessment evidence in this case.

#### *What Is Forensic Science & How Is It Relevant to Psychological Assessments?*

13. Our opinion about best practices for forensic psychological assessments is also informed by authoritative discourse about principles and standards of practice for the
